

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

#### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + Keep it legal Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

#### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <a href="http://books.google.com/">http://books.google.com/</a>

# MONTHLY REVIEW,

For J U L Y, 1780.

### 

ART. I. Account of the Russian Discoveries between Asia and America: to which are added, the Conquest of Siberia, and the History of the Transactions and Commerce between Russia and China. By William Coxe, A M. Fellow of King's College, Cambridge, &c. 410. 188. Boards. Cadell. 1780.

THE Author of this performance \*, during his residence at Petersburg, particularly directed his inquiries to the discoveries that have lately been made by the Russians in the sea that separates Asia from America. For this purpose, he endeavoured to collect the respective journals of the different voyages subsequent to the expedition of Beering and Tschirikoss in 1741, with which the celebrated Muller concludes his account of the first Russian navigations in these parts.

Having been informed, in the course of his researches, that a treatise in the German language, published at Hamburg and Leipsic, in 1776, contained a sull and exact narrative of the Russian voyages from 1745 to 1770; and having been assured that this publication, though anonymous, had been actually compiled from the original journals; he could not avoid considering it as a work of the highest credit, and well worthy of being more generally known and perused. Its exactness as well as authenticity were sufficiently ascertained, in a letter written to Mr. Coxe by Mr. Muller; who, by order of the Empress, had arranged the journals from which the anonymous author of the German treatise is said to have drawn his materials.

A translation of this treatife, moulded however into a somewhat different and more convenient form, and illustrated by occasional notes and references, constitutes the first part of the present performance. It commences with some preliminary ob-

Mr. Coxe is likewise Author of "Sketches of the natural, civil, and political State of Swisserland." See Rev. for May 1779, p. 342.

Voz. LXIII.

B

fervations,

fervations relative to the discovery and conquest of Kamtchatka, its present state, population, commerce, &c.; and is followed by an account of the various discoveries made in the sea of Kamtchatka, from the time of Beering in 1741, down to the year 1770; particularly that of the Aleutian Islands, first discovered in 1745; and that of the still more distant groupe of isles, supposed to extend very near to the coast of America, and which have been denominated the Fox Islands. It is to be observed, that almost all the expeditions related in this treatise were undertaken by private adventurers, for commercial purposes.

In an Appendix, Mr. Coxe has collected all the additional intelligence that he was able to procure at Petersburg respecting these subjects; particularly three journals never before given to the public. The most material of these is an extract from the journal of a voyage made by Captain Krenitzin, and Lieutenant Levashess, to the Fox Islands, by order of the Empress, in the years 1768 and 1769. This journal, together with the chart of the voyage which accompanies it, were sent by order of the Empress to Dr. Robertson, and were by him communi-

cated to the Author.

Further to illustrate this treatife, Mr. Coxe has collected the best charts relative to the subject of it, that could be procured at Petersburg; and from all these circumstances be expresses his hopes, that the curious and inquisitive Reader will not only find in it the most authentic and circumstantial account of the progress and extent of the Russan discoveries, which has hitherto appeared in any language; but be enabled hereafter to compare them with those more lately made by that great and much to be regretted navigator, Captain Cook, when his journal shall be communicated to the Public.'

The discovery of Beering's Isle, where its discoverer was wrecked in 1741, and which is situated due east from Kamtchatkoi Noss (or Cape) in the 185th degree of east longitude , was soon followed by that of Copper Island; which indeed lies in sight of it, and acquired its name from the large masses of native copper that are sound upon the beach. The scarcity of land and sea animals, and of sur, the numbers of which in these two islands had been greatly diminished by the Russian hunters, gave occasion to numerous expeditions from Kamtchatka, undertaken by private merchants. Several of the vessels having been driven by stormy weather to the south-east, the Aleutian Isles were thus accidentally discovered, situated about ten degrees somewhat to the southward of the east from the cape above-mentioned, or in longitude 195, and latitude 54.

In 1761 a groupe of new islands was discovered, lying to the

**porth** 

Here and elsewhere in this Article the longitude is always reckoned from Faro.

north-east of these last, at the distance of 600 or 800 versts;— [three versts are about equal to two English miles] and were

called the Indreanoff/ky Isles.

Somewhat before this time, however, a confiderable Archipelago had been discovered; beginning at the distance of about 15 degrees from the last mentioned islands, and lying about south-east, or east-south-east, from them: extending between the 56th and 61st degrees of north latitude, and from 211 degrees of longitude most probably to the continent of America.

Notwithstanding these discoveries, it does not appear that the main land of America has been touched at by any of the veffels in the late expeditions; though possibly, says our German Author, ' the time is not far distant when some of the Russian adventurers will fall in with that coast. More to the north perhaps, at least as high as 70 degrees latitude, the continent of America may stretch out nearer to the coast of the Tschutski; and form a large promontory, accompanied with islands which have no connection with any of the preceding ones. fuch a promontory really exists, and advances to within a very small distance from Tschukotskoi Noss, can hardly be doubted; at least it seems to be confirmed by all the latest accounts which have been procured from these parts. That prolongation therefore of America, which by Delisle is made to extend westward, and is laid down just opposite to Kamtchatka, between 50 and 60 degrees latitude; must be intirely removed; for many of the voyages related in this collection lay through that part of the ocean, where this imaginary continent was marked down.

Treating of this subject in his Appendix, Mr. Coxe offers some conjectures concerning the proximity of the Fox Islands to the continent of America. The first intelligence, he observes, concerning the supposed vicinity of the coasts of Asia and America was derived from the reports of the Tschutski in their intercourse with the Russians.— Vague and uncertain accounts, drawn from a barbarous people, cannot deserve implicit credit; but as they have been uniformly and invariably propagated by the inhabitants of these regions, from the middle of the last century to the present time; they must merit at least

the attention of every curious enquirer.'

These reports were first related in Muller's account of the Russian discoveries, and have been lately thought worthy of notice by Dr. Rubertson, in his History of America. Their probability seems still surther increased by the following circumstances.

Plenisner, Commander of Ochotsk, received express orders from the court of Russia to proceed to Anadirsk, and to procure all possible intelligence concerning the north-eastern part of Siberia, and the opposite continent. Not content with B 2

collecting all the information in his power, from the Koriacs, who have frequent intercourse with the Tschutski; he also sent one Daurkin into their country. This person was a native Tschutski, who had been taken prisoner, and bred up by the Russians. He continued two years with his countrymen, and made several expeditions with them to the neighbouring islands, which lie off the eastern coast of Siberia. The sum of his intelligence was as follows:

That Tschukotskoi Noss (the north-eastern cape of Asia) is a very narrow peninsula; that the Tschutski carry on a trade of barter with the inhabitants of America; that they employ six days in passing the strait which separates the two continents: they direct their course from island to island; and the distance from one to the other is so small, that they are able to pass every night ashore. More to the north he describes the two continents as approaching still nearer to each other, with only

two islands lying between them.'

'This intelligence remarkably coincided with the accounts collected by Plenisner himself among the Koriacs. Plenisner returned to Petersburg in 1776, and brought with him several maps and charts of the north-eastern parts of Siberia, which were afterwards made use of in the compilation of the general map of Russia, published by the Academy in 1776. By these means, the country of the Tschurski has been laid down with a greater degree of accuracy than heretofore. These are probably the late accounts from those parts which the anonymous Author alludes to.'

We should add, that Mr. Coxe has, in his Appendix, given us some further intelligence on this subject; which, how imperfect soever, is all that he has yet been enabled to procure, and is accompanied with an authentic chart. It relates to a voyage of discovery, begun by Lieutenant Synd, in 1764, and sinished in 1768. He steered a course more to the north-east than any of his predecessors; and consequently, as appears from the preceding relations, had a much better chance of falling in with the continent of America; which undoubtedly approaches nearest to that of Asia to the northward.

This navigator fell in with a cluster of islands (most probably those above-mentioned, to which the Tschutski resort) stretching between 61 and 62 degrees of latitude, and 195° and 202° longitude. These islands lie south-east and east of the coast of the Tschutski; and several of them are situated very near the shore. Besides these small islands, he discovered also a mountainous coast lying within one degree of the coast of the Tschutski, between 64 and 66 degrees north latitude; its most western extremity was situated in longitude 199° 1°. This coast is laid down in his chart as part of the continent of America; but it

cannot be known on what proofs he grounds this determination, until a more circumstantial account of his voyage is communicated to the public.

For a recital of the various adventures of our Russian navigators and discoverers, or rather fox-hunters-(for such was their principal object and occupation) who have explored the sea between Kamtchatka and America, since the time of Beering, we must refer the Reader to the work itself. He will there meet with a feries of disasters, particularly arising from repeated infurrections of the natives of the new discovered islands; which might indeed naturally be expected by a fet of strangers succesfively invading the territories of others, and not only establishing themselves upon them, and killing their game, but in a thort time exacting tribute from them, for the use of a certain unknown potentate. This last claim must appear the more extraordinary to these islanders; who do not pay any tribute, and scarce any respect, to their own nominal chiefs. It appears a difficult task, and not to be accomplished without blows, to persuade such people to contribute to the revenue of a distant Empress; and yet, in some of the islands, such a revenue has been established.

From the account of the last expedition to the Fox Islands in 1769, undertaken by order of the Empress, we shall select a tew particulars relative to the inhabitants, and the proceedings of their new visitants.

These islanders are of a middle stature, a tawny brown colour, and have black hair. 'Their summer dress is a kind of shirt made of birds skins; over which, in bad weather, and in their boats, they throw cloaks made of thin whale guts. To ornament their countenances, they thrust a pin four inches long, made of bone, through the partition of the nostrils; from the ends of which, in fine weather, and on high festivals, they suspend rows of beads, one below the other. To render themselves still more charming, they persorate their under-lips, and thrust into the holes either beads, or bits of pebble, cut in the shape of teeth. According to the account of a preceding voyager, they make three incisions in the under-lip; placing in the middle one a flat bone, or a small coloured stone, and, in each of the two other perforations, a long pointed piece of bone, that bends and reaches almost to the ears. Men and women indifcriminately adorn themselves with these nose and lip pins; nor do the dreffes of the fexes materially vary in other particulars.

They are very fond of Russian oil, or butter, but not of bread. They could not be prevailed upon to taste any sugar, until the Commander shewed the example; and then finding it sweet, they put it up to carry it home to their wives; of whom

it is common for them,' says the Author of the account, 'to have two, three or sour, and some have also an object of unnatural affection, who is dressed like the women.' The Author alludes to, but without clearing up, this last obscure circumstance; when he afterwards observes, that though their boats are like those of the Americans, their customs and way of life seem to indicate that they are of Kamchatdal origin.—'Their huts,' he adds, 'their manner of kindling fire, and their objects of unnatural affection, lead to this conjecture.'—On being asked concerning their origin, they said that they had always inhabited these islands, and knew nothing of any other country beyond them.

In each village there is a kind of Chief called Tookoo, who is not diffinguished by any very particular authority, or marks of rank; nor is his office hereditary. He decides their differences; and the only mark of his dignity is, that when he goes out to sea, he is exempted from working, and has a servant for the purpose of working the canoe. At all other times he works

like the rest.

The Russians frequent these islands on account of furs, of which they have imposed a tax on the inhabitants. The traffick is thus conducted. They go in autumn to Beering's and Copper Island, and there winter; employing themselves in catching what are here called the sea cat and sea lion. The flesh of the latter is represented as very delicate food. They flesh of the latter is represented as very delicate food. carry the skins of these animals to the Eastern or Fox Islands, where they are used in constructing the boats of the islanders. These islands they visit the next summer, and there lay up their ships for the winter.— They then endeavour to procure, either by persuasion or force, the children of the inhabitants, particularly of the Tookoos, as hostages. This being accomplished, they deliver to the inhabitants fox-traps, and skins, for which they oblige them to bring furs and provisions during the winter. After obtaining from them a certain quantity of furs, by way of tax, for which they give them quittances; the Russians pay for the rest in beads, false pearls, goat's wool, copper kettles, hatchets, &c. In the spring they get back their traps, and deliver up their hostages.'

They dare not hunt alone, nor in small numbers, on account of the hatred of the natives. These people could not, for some time, comprehend for what purpose the Russians imposed a tribute of skins, which were not to be their cown property, but belonged to an absent person; for their Tookoos have no revenue. Nor could they be made to believe, that there were any more Russians than those who came among them: for in their own country, all the men of an island go out together. At present they comprehend something of Kamtchatka, by

means of the Kamtchadals and Koriacs who come along with the Ruffians; and on their arrival love to affociate with people whose manner of life resembles their own.

· As all the furs that are brought from the new discovered islands, and which are of considerable value, are sold to the Chinese, Mr. Coxe was naturally led to make inquiries concerning the commerce between Russia and China. The conquest of Siberia opened a communication with this last mentioned country; and paved the way to the discoveries related in the present work. The second part of the present personnance is appropriated to this subject. It contains a short account of the conquest of Siberia by the Russians, and the history of the transactions between Russia and China, together with the present state of the commerce between the two countries. The materials of which it is formed have been chiefly compiled from the works of Mr, Muller, and Mr. Pallas; augmented by additional circum-Rances, relative to the Ruffian commerce with China, which the present Author collected during his residence at Petersburg. In this narrative are contained accounts of the transactions relative to the first irruption of the Russians into Siberia, in the fixteenth century; and of the final conquest and colonization of that country, towards the middle of the seventeenth; when their progress was checked by the Chinese, with whom the disputes concerning the limits of the two empires were finally terminated by the treaty of Kiachta, in 1728; by which it was stipulated, that the commerce between the two countries should be transacted at the Russian and Chinese frontier towns of Kiachta and Maimatschin, nearly adjoining to each other.

A view of the latter, or of the Chinese frontier town, is here given; together with a particular account of its buildings, pagodas, &c. Though it contains about 1200 inhabitants, it is a very remarkable circumstance, and is perhaps the only instance of its kind in the world, that there is not a single woman among them. This circumstance, we are told, is occasioned by the policy of the Chinese government; which totally prohibits the women from having the slightest intercourse with so-

teignets.

To give the Reader some idea of the immense tract of country, through which the merchandize is transported by land carriage, in the trade carried on between Russia and China; the Author gives a list of distances between various places situated in this tract. From this it appears, that the distance from Petersburg to Kiachta, by the way of Moscow, Tobolsk, and Irkutsk, is no less than 6508 versts; and from Kiachta to Pekin, 1532 versts: so that the whole of the route from Petersburg to Pekin amounts to more than 5300 English miles.

B 4

One of the most interesting subjects of which the Author treats, in the Appendix subjoined to this treatise, is the possibility, or rather practicability, of a north-east passage. From the facts here brought together it is rendered very probable that such a passage exists; but it seems to be still more decisively proved that it can never be usefully applied to the purposes of general commerce. At least, it seems clear to us, from his representation, that much more would be lost, in time, than could be gained with respect to space, by attempting a passage through the Frozen into the Pacific ocean. We shall recite the principal sacts, on which this proposition is sounded; extracted from the Author's more sull account of the attempts of the Russians to ascertain the reality of this passage:—supposing the Reader to have a map of the northern parts of Europe and Asia before him.

The advocates for the north-east passage, the Author obferves, have divided that navigation into three principal parts; and by endeavouring to shew that these three parts have been passed at different times, they conclude from thence that the whole, taken collectively, is practicable.

These three parts are, 1. From Archangel to the river Lena; 2. From the Lena, round Tschukotskoi Noss (or the north-eastern promontory of Asia), to Kamtchatka; and 3. From Kamtchatka

to Japan.

No one ever afferted that the first part, from Archangel to the Lena, was ever performed in one voyage; but several perfons having advanced that this navigation has been made by the Russians at different times, the Author gives a summary view of the voyages that have been made in these seas. From this it appears, that there is a cape between the rivers Chatanga and Piasida that has never yet been doubled. Accordingly the whole space between Archangel and the Lena has never yet been navigated:— for in going east from the Yenisei, the Russians could get no farther than the mouth of the Piasida; and in coming west from the Lena, they were stopped, according to Gmelin, north of the Piasida; and according to Muller, east of the Taimura. This cape, to the east of Nova Zembla, and lying north of the river Piasida, is laid down in the Russian charts in about 78 degrees latitude.

With respect to the second division of the North-east passage, or that from the river Lena to Kamtchatka; it has been affirmed that a passage has been effected by several vessels, which have at different times sailed round the north-eastern extremity of Asia. But from the Russian accounts the Author collects that, though trequent expeditions have unquestionably been made from the river Lena to the Kovyma; yet the voyage from the Kovyma,

round

round the north-eastern promontory of Asia, into the Eastern ocean, has been performed but once. According to Mr. Muller, this formidable cape was doubled in the year 1648, by one Deshneff; who set sail with fix other vessels, from the mouth of the Kovyma, in order to penetrate into the Eastern ocean. A particular account of this remarkable expedition is here given; at the close of which we are told that no other navigator, subsequent to Deshneff, has ever pretended to have passed the north-eastern extremity of Asia; notwithstanding all the attempts that have been made to accomplish this passage, as well from Kamtchatka, as from the Frozen Ocean. Indeed Beering thought that he had passed it, on meeting with a deep bay, in about the latitude of 67°, as he was failing northward along the coast of the Tschutski, and which he mistook for the Northern ocean. The coast which here turns round to the west, afterwards takes a northerly direction; as he would have found, had he persisted somewhat longer in a northern course.

Of the third, or remaining part of this passage, no doubt can be entertained. That there is a connection between the seas of Kamtchatka and Japan, first appeared from some Japanese vessels, which were wrecked upon the coast of Kamtchatka, in the beginning of this century; and this communication has been unquestionably proved from several voyages made by the Russians from Kamtchatka to Japan.—We shall conclude our account of the present work, by transcribing the Author's observations on the whole of the evidence relative to this subject.

In reviewing the several accounts of the Russian voyages in the Frozen sea, as far as they relate to a North-east passage, we may observe, that the cape which stretches to the north of the Piasida has never been doubled; and that the existence of a passage round Tschukotskoi-Noss rests upon the single authority of Deshneff. Admitting however a practicable navigation round these two promontories, yet when we consider the difficulties and dangers which the Russians encountered, in those parts of the Frozen sea which they have unquestionably sailed through; how much time they employed in making an inconfiderable progress, and how often their attempts were unsuccessful; when we reflect at the same time that these voyages can only be performed in the midst of a short summer, and even then only when particular winds drive the ice into the sea, and leave the shores less obstructed; we shall reasonably conclude that a navigation, pursued along the coasts in the Frozen ocean, would probably be useless for commercial purposes.

A navigation therefore in the Frozen ocean, calculated to answer any end of general utility, must (if possible) be made in an higher latitude, at some distance from the shores of Nova Zembla and Siberia. And should we even grant the possibility of failing N. E. and East of Nova Zembla, without meeting with any insurmountable obstacles from land or ice; yet the final completion of a N. E. voyage must depend upon the existence of a free passage between the coast of the Tschutski and the continent of America.' I have said a free passage, [the Author adds in a note] because if we conclude from the narrative of Deshness's voyage, that there really does exist such a passage; yet if that passage is only occasionally navigable (and the Russians do not pretend to have passed it more than once), it can never be of any general and commercial utility.'

ART. II. A new History of Gloncestersbirg. Comprising the Topography, Antiquities, Curiosities, Produce, Trade and Manufactures of that County; the Foundation-charters and Endowments of Abbeys, and other religious Houses; the Foundation of the Bishopric, &c. with a short biographical Account of the Bishops and Deans; the Names of the Patrons and Incombents, and the ancient and present Value of all the ecclesiastical Benefices; Charters of Incorporation, and Civil Government of the several Boroughs; Descriptions of the principal Seats; Descent of the Manors; Genealogies of Families, with their Arms, Monumental Inscriptions, &c. Also, the Ecclesiastical, Civil, and Military History of the City of Gloucester, f om its first Foundation to the present Time. With a Copy of Domesday book for Gloucestershire, now first printed in the Language, and after the Manner of the Original. Illustrated with a Map of the County, Views of Gentlemen's Seats, &c. &c. Folio. 3 l. 3 s. Boards. Cirencester, printed by Samuel Rudder, 1779. Sold by Crowder in London.

THE ancient and present State of Gloucestershire was published by Sir Robert Atkyns in 1712. That edition becoming starce, and dear, gave rise to the present performance; but soon after the proposals for this New History were delivered out, some person republished Sir Robert's book, without the least addition or improvement. This, says Mr. Rudder, is a fact very necessary to be stated, but it wants neither comment nor remark.

Sir Robert Atkyns's work is undoubtedly the foundation of this, and the Editor, accordingly, acknowledges, that he has adopted that gentleman's method of alphabetical arrangement, and availed himself of whatever was useful: but he has made many additions and improvements. We shall give a few extracts from Mr. Rudder's Preface, for the information of our Readers.

The preliminary and introductory part, we are told, is drawn from various fources. The monastic history is chiefly taken from Stevens's Supplement to Dugdale's Monasticon, and Dr. Burnet's History of the Reformation. The other introductory materials are selected from Camden, Selden, Lord Lyttelton,

telton, and various writers on the ancient state of assairs in Britain. This introduction gives a brief but very proper account of abbeys, priories, colleges, guilds, &c. of religious orders; of the alterations introduced by the Reformation; of advowsons, patronages, presentations, tithes, first-fruits, &c. and of the names of places, persons, titles and dignities;—and acquaintance with which will naturally be expected in a publication of this kind. Some of our Readers may p rhaps be entertained in perusing the following account of a popish miracle, which we find in this introductory part.

At Hayles, in Gloucestershire, the pretended blood of Christ was shewed in a phial, and it was taught, that none could see it who were in mortal sin. But good presents being made, the deluded pilgrims went away well satisfied with the sight of it. This was the blood of a duck, renewed every week, put into a phial, very thick on one side, and thin on the other; and either side turned toward the pilgrim, as the priests were satisfied with their oblations. This is only one among numerous instances of Popish priestcraft on the one hand, and ignorant credulity (which is the very basis of Popery) on the other. But we return

to the Preface, in which we are farther informed, that

The history of the county, in the three grand divisions of Cotefwold, Vale, and Forest, with the account of its trade, is new; and that part of Domesday which relates to Gloucestershire, and concludes the general history, is now first printed in the language, and after the contracted manner, of the original, so far as with common printing types could be effected. The history of the city and diocese of Gloucester, making together 129 pages, is newly drawn up from materials collected by the late Rev. Mr. Furney, archdeacon of Surrey, and communicated by Mr. Rogers of Gloucester. The parochial history follows next in order; and the Editor, to be correct, and note every thing observable, has visited the several parishes, and made diligent enquiries. He has given an account of their anriquities and natural curioficies, and has attempted also to add the etymology of the names of places, agreeing with or diffenting from Sir Robert Atkyns occasionally.

In this part of his work he describes the market towns and most remarkable places where the former history was desective; though, he observes, to descend to a minute description of every

little village would have been ridiculous.

The descent of manors is attended to with great care; to which are added, in each parish, the account of ecclesiastical benefices, names of patrons, value of livings, some monuments and inscriptions in churches, benefactions to the poor, the rate of the public taxes, and the comparative state of population in each

A

each parish, between the time when Sir Robert Atkyns made

his collections and the present.

In respect of the latter article, we find the following remarks: • The alarm lately spread of the nation's depopulating, induced the Editor to compare the average of births and burials about seventy years ago, with those of the present time, taking the authority of the registers in both instances.—The result of the comparison is, that the inhabitants of Gloucestershire are very confiderably increased during that period, but not uniformly so. In some places their numbers are more than doubled, while in others they continue nearly the same. This is owing to different causes: the growth of trade, and improvements in agriculture, encourage population, and the decline of manufactures produces a contrary effect. During the before-mentioned period, agriculture has been much improved, particularly in the Hill country; and in the clothing and manufacturing parts, trade has equally increased; but in the Vale most of those inclofures that in the former part of this period were corn-fields, have fince been laid down to pasture, which very sensibly affected population; and though even some of those places where that has happened, are more populous than they were before, yet the alteration has prevented them from increasing so much as they would have done; for dairy and grazing farms furnith less employment than tillage, and many of the younger people bave migrated to the Hill country or to market-towns."

Another impediment to population has crept in, during the latter part of this period, which is, the laying of two or three farms into one. The little parish of Aston Subedge is chiefly in tillage, and Sir Robert Atkyns reports it to have consisted of 24 houses, and 104 inhabitants. By an exact account taken in 1773, the householders were 20, and the inhabitants only 63; and on inquiry into the cause of this strange declension, it was given for a reason, that the parish had just then been inclosed, and seven farms, of which it consisted before, being laid into four, the occupiers of three little farms, with their families, had left the place. There are two or three other instances

in the county, besides this, of a like decrease."

Here some notice should be taken of a practice prevailing in some places, lest it become more general, and produce a train of evil consequences to the community. It is said, that in some parishes the lords of manors, and the principal land-holders, considering it as a piece of refined policy, have pulled down their cottage-houses, or suffered them to fall, on purpose to drive away the poor miserable inhabitants, and to prevent the younger sort from marrying and settling in their own parishes. Miserable indeed! to be deserted and abandoned by those whose

lands they have cultivated, and whose granaries they have filled. Miserable! to be expelled from the place of their nativity, as unworthy to breathe the air in common with their lords and masters; who deaf to the calls of humanity, and inattentive to their own real interest, seem not to be sensible, that without the labourer's hand their ample fields would be of no value, and that rents advance from labour and improved cultivation. If the poor are burthensome, they should be relieved, and not extirpated. The industrious part of them are the most profitable members of the community; the idle should be reclaimed; but that will never be effected by penal laws, while our towns and villages fwarm with ale-houses. It is there they fpend their time and money; there their morals are corrupted; there the fot, the poacher, the petty thief and highwayman are gradually formed; and to those seminaries of vice we chiefly owe the evils complained of among the lower class of people. Strike at the root of them; put down the ale-house, not the cottage, in your village; so shall you soon find the poor more industrious, more honest, and less burthensome.

'This is a matter highly deserving the attention of the magisfrate, on whose conduct in the execution of his office, the morals of the people, and the well-being of the state, so much depend. It is a vulgar error, that the drunkard injures nobody but himself: hundreds are connected with him; and the community suffers more from one character of that sort, than it is benefited by two sober persons.'

The Editor further observes, that 'he has been led as it were inadvertently into these reslections, though they may not be peculiarly applicable to Gloucestershire, yet as a general well-wisher to his country, he hopes they are not altogether unseasonable.' For the same reason, it may be added, we have thought it proper to insert the above extract.

The Appendix, which follows the parochial history, confists of a variety of charters, and papers of confiderable length: a copious and useful index finishes the volume.

The prints in this large volume are not numerous; we meet with a view of Barrington-park, the feat of the Countess of Talbot; Berkely castle, one of those sew ancient buildings which are suffered by their proprietors to remain much in their original form; a plan of the Home Park at Cirencester, with two small views of the house; a plan of Oakley Great-park, belonging, as well as the former, to Earl Bathurst; two small views of Alfred's-hall; a view of Fairford church; Lydney-park, the seat of Thomas Bathurst, Esq; Wallsworth-hall; belonging to Samuel Hayward, Esq; Sudley-castle, a seat of Lord Rivers; two sections of Pen-park Hole, rendered more remarkable by the most melancholy and satal accident which besel a clergyman

elergyman in the year 1775 who approached too near it. Aft advertisement at the beginning of the volume informs us, that feveral gentlemen have ordered plates of their feats to be engraved, which could not be finished in time; but the impressions as soon as procured will be delivered gratis, and guards are placed in the proper places to receive them.

Some entertaining particulars might be drawn from this volume; but it will not comport with the limits of this Review to

sclect them. We may, however, insert the following:

In the map of the county is given an engraving of the Co-tham stone, a natural production in the parish of Westbury. It lies in a detached manner, within the furface of the grounds The upper fide of it is full of nodules and bunches, and the prominencies on some of these stones resemble the interlacings of ivy, growing over each other, as it is sometimes seen against old walls. The largest of them are about two feet and a half long, and seven or eight inches thick. They are used rough in the ruftic work of gateways and other buildings, in which they have a good effect. Cut longitudinally through the thick-Hels, and polished, they exhibit a beautiful landscape, like a drawing in Indian ink, and are often used in chimney-pieces; That part which in its native bed lies undermost, has the exact appearance of a river; beyond that there is a margin of trees and shrubs; next, another river; and a fertile fancy may very well imagine a high-bank on the further fide; covered with shrubs and hanging woods. The Cotham stones that I have feen have in them all the appearance of one or more rivers; but the other objects admit of variety in form and order in different Hones.

In the description of St. George's, a newly erected parish not very distant from the city of Bristol, the Editor, among other things concerning the church, farther remarks; 'It was consecrated Sept. 6, 1756. A revel is constantly kept on the anniversary of the church's consecration, in pious commemoration of the divine goodness, in causing this fabric at a great expence, to be founded and endowed, for the accommodation of the inhabitants in their weekly attendance on divine worship: which revel is most devoutly celebrated by great numbers of the parishioners, and others, in the adjacent ale-houses, with all the solemnities of an old pagan festival; that is, drunkenness, gluttony, riot, debauchery, curfing and swearing, scolding and fighting, fiddling and dancing, Bacchanalian fongs, and midnight impurities!' Mr. Rudder also exptesses his sutprize, that the worthy persons concerned in erecting this church should have given it the name of St. George, 'a faint not to be found in the calendar of the church of England since the Reformation. He adds in a note the story of St. George, as it is related in an ancient manuscript festival, written about the time of King Henry VI. and in the possession of a particular friend, which may, he says, serve as a specimen of our language, of the credulity of the people, and of the state of religion at that time.'

We have particularly mentioned the above reflections relative to St. George's church, as manifesting, among other things, a good spirit in the Editor of this work, and also as declaring a

fact which ought to be generally known and censured.

We shall finish our account with observing, that the Editor of this volume appears to us to have been very industrious in preparing it for the public eye, and we esteem it a work in its kind which justly merits notice and approbation.

ART. III. Political Annals of the present United Colonies, from their Settlement to the Peace of 1763. Book 1. By George Chalmers, Esq. Concluded. See our last.

AFTER the free strictures which we have passed on the design and spirit of this work, it would be injustice to take leave of it without informing our Readers, that it is of great value as a collection of authentic materials, many of which had not before been brought to light. Besides the information which the Author has obtained from Acts of Assemblies, and State Papers already published, he has collected many valuable papers from the records preserved in the Plantation-office. Some of these we shall lay before our Readers.

The following deposition given to Charles II. against certain New Englanders, with their defence, are too curious, both in

matter and manner, to be omitted.

' John Crown, gentleman, maketh oath, that, while he was at Boston, in New-England, soon after his Majesty's happy Restoration, Goffe and Whaley, two of the execrable murderers of his Majesty's royal father, of blessed memory, landed there; and, at their landing, were conducted to the house of John Endicot, then Governor of the Massachusets colony, and that it was reported by all the deponent conversed with, that the said Governor embraced them, bade them welcome to New England, and wished more such good men as they would come over. That, after the faid Goffe and Whaley refided fome time at Boston, visiting and being visited by the principal persons in the town, and that, among others, they visited Mr. John Norton, the teacher of the principal independent church in the said town, and one of those who came over with the address and letter of the said colony to his Majelly: That the deponent then boarded in the house of Mr. Norton, and was present when they visited him, and that he received them with great demonstrations of tenderness; that, after this the fuid Goffe and Whaley went and resided in Cambridge, (the university of New-England, of which the deponent was a member,) and that, having acquaintance with many of that university, he inquired of them how the faid Goffe and Whaley were

received; and that it was reported to him by all persons, that they were in exceeding great efteem for their parts; that they held meetings in their house, where they preached and prayed, and gained universal applause and admiration, and were looked upon as men dropped down from heaven; that this was the phrase of all the deponent heard discourse about them, but that penitence for the horrid murder for which they fled did not appear to be any part of that piety, which sainted them in their esteem, for that Whaley said openly, almost in all places where he came, that, if what he had done against the King were to be done, he would do it again; and that it was the general report of the place, that he was frequently heard to fay these words: That in the asoresaid town Whaley and Gosse refided, until commands came from his Majesty to the Governor of . Massachusets for their apprehension; but that those commands were neither executed, nor, to the best of the deponent's remembrance, published, nor any proclamation or order, by their own authority, issued out for it; otherwise it had been almost impossible for the murderers to escape as they did, by reason of their living and conversing so publicly, and their having no places to sly to, besides there being several loyal persons in Boston, (though no members of the church or state,) who, if they might have had permission from the government, would have ventured to seize them: and the deponent doth likewise remember, that, being afterwards in company of several merchants at Boston, and discoursing of Hugh Peters and his execution, some persons did there say, that there were many godly in New-England that dared not condemn what Hugh Peters had done.

REMARK. Lord Say and Seal, when his glass was almost run out, informed the Governor of Massachusets, in July, 1661; " I must fay, for Mr. Crown, he hath appeared both here, in the " Council, and to the Lord Chamberlain and others, as really and cordially for you as any could do, and hath allayed the ill opinion " of your cruelty against the Quakers. - I must request you will accordingly requite Mr. Crown his love, care, and pains, for you." -See the letter in Hutch. Hift. 1 vol. 220.

Hutch. Hist. 1 vol. 210-11.-Candour requires, that, as all men should be allowed to speak their own justification, the people of Massachusets should be permitted to tell their own story their own way: the address of the General-court is therefore subjoined .- From

N. Eng. Papers, 4 vol. p. 490.

"Most gracious and dread Sovereign,

" May it please your Majesty (in the day wherein you happily fay, you now know, that you are again King over your British Israel) to cast a favourable eye upon your poor Mephiboseths now, and by reason of lameness, in respect of distance, not until now appearin your presence, we mean New-England, kneeling, with the rest of your subjects, before your Majesty, as her restored King. We forget not our ineptness as to these approaches. We at present own fach impotency, as renders us anable to excuse our impotency of speaking unto our Lord the King: yet, contemplating such a King, who hath also seen adversity, that he knoweth the hearts of exiles, who hath been himself an exile, the aspect of Majesty, thus extraordinarily circumstanced, influenceth and animateth examinated outcaits talks, (yet outcasts as we hope for the truth) to make this address unto their prince, hoping to find grace in his sight: we present this scrip, the transcript of our loyal hearts, into your royal hands, wherein we crave leave:

"To supplicate your Majesty for your gracious protection of us, in the continuance both of our civil privileges, according to (and of our religious liberty, the grantces known end of) the patent conferred upon the Plantation by your royal father. This, this, viz. our liberty to walk in the faith of the gospel, with all good confcience, according to the order of the gospel, (unto which the former, in these ends of the earth, are but subservient,) was the cause of our transporting ourselves, with our wives, our little ones, our substance, from that pleasant land, over the Atlantic Ocean, into this wast and waste wilderness; chusing rather the pure scripture worship, with a good conscience, in this poor remote wilderness, among the heathens, than the pleasures of England, with subjection to the then so disposed and so far prevailing hierarchy, which we could not do without an evil conscience. For this cause we are this day in a land, which lately was not fown, wherein we have conflicted with the fufferings thereof much longer than Jacob was in Syria. Our witness is in heaven, that we left not our country upon any diffatisfaction, as to the conflitution of the civil state: our lot, after the example of the good old non-conformist, hath been only to act a passive part, through these late vicissitudes and successive overturnings of state; our separation from our brethren in this desert hath been, and is, a fuffering, bringing to mind the application of Joseph; but providential exceptions of us thereby from the late wars, and temptation of either party, we account as a favour from God; the former clothes us with fackcloth, the latter with innocency.

"What reception, courtefy, and equanimity, those gentlemen and other adherers to the royal interest, who in adverse changes vifited these parts, were entertained with amongst us, according to the

meanness of our conditions, we appeal to their own reports.

"Touching complaints put in against us, our humble request only is, that, for the interim wherein we are dumb, by reason of absence, your Majesty would permit nothing to make an impression upon your royal heart against us, until we have opportunity and licence to answer for ourselves. Few will be nocent, said that impleader, if it be enough to deny; sew will be innocent, replied the then Emperor,

if it be enough to accuse.

"Concerning the Quakers, open capital blasphemers, open seducers from the glorious Trinity, the Lord's Christ, our Lord Jesus Christ, the blessed gospel, and from the holy scriptures, as the rule of life, open enemies to government itself, as established in the hands of any but men of their own principles, malignant and assistance of any but men of their own principles, malignant and assistance of doctrines directly tending to subvert both our church and state: after all other means, for a long time used in vain, we were at last constrained, for our own safety, to pass a sentence of banishment against them, upon pain of death; such was their dangerous, impetuous, and desperate turbulency to religion and to the state, civil and ecclessastical, as that, how unwilling soever, could it have been avoided, the magistrate at last, in conscience both to God Rav. July, 1780.

and man, judged himself called, for the desence of all, to keep the , passage with the point of the sword held towards them; this could do no harm to him that would be warned thereby; their willingly rushing themselves thereupon was their own all, and, we with all humility conceive, a crime, bringing their bloods upon their own heads. The Quakers died not because of their other crimes, how capital foever; but upon their superadded presumptuous and incorrigible contempt of authority, breaking in upon us notwithstanding the fentence of banishment made known to them: had they not been restrained, so far as appeared, there was too much cause to fear that we ourselves must quickly have died, or worse; and such was their infolency, that they would not be restrained but by death; nay, had they at last but promised to depart the jurisdiction, and not to return without leave from authority, we should have been glad of such an opportunity to have said they should not die.

" Let not the King hear mens words; your fervants are true men, fearers of God and the King, and not given to change, zealous of government and order, orthodox and peaceable in Israel: we are not seditious as to the interest of Cæsar; nor schismatics as to matters of religion; we distinguish between churches and their impurities; between a living man, though not without fickness and infirmities, and no man. Irregularities, either in ourselves or others, we desire may be amended; we could not live without the worship of God; we were not permitted the use of public worship without such a yoke of subscription and conformity as we could not consent unto without That we might, therefore, enjoy divine worship without human mixtures, without offence either to God or man or our consciences; we, with leave, (but not without tears,) departed from our country, kindred, and fathers houses, into this Patmos; in regard whereunto, we do not fay our garments are become old by reason of a very long journey, but that ourselves who came away in our strength, are, by reason of very long absence, many of us become grey headed, and fome of us stooping for age. The omission of the prementioned injunctions, together with the walking of our churches, as to the point of order in the congregational way, is all wherein we differ from our orthodox brethren.

" Sir, we lie not before your facred Majesty: the Lord of Gods, the Lord God of Gods, he knoweth, and Israel he shall know, if it were in rebellion or schism that we willingly lest our dwelling in our own, or continue our dwellings in a strange, land, save us not this

Royal Sir, if, according to our humble petition and good hope, the God of the spirits of all flesh, the Father of mercies, (who comforteth the abject,) shall make the punishment of the bereavement of that all, for which we do leave and do luffer the loss of all, precious, fo precious, in your fight; or that your royal heart shall be inclined to shew unto us that kindness of the Lord in your Majesty's protection of us in these liberties, for which we hither came, and which hitherto we have enjoyed. upon Hezekiah's speaking comfortably to us as to fons; this orphan shall not continue fatherless, but grow up as a revived infant under its nursing-father: these churches shall be comforted in a door of hope opened by so signal a pledge of the lengthening

lengthening of their tranquillity; these poor and naked gentiles, not a few of which through grace are come and coming in, shall still see their wonted teachers, with encouragement of a more plentiful increase of the kingdom of Christ among them; and the blessing of your poor afflicted (and yet we hope trusting in God) shall come upon the head and heart of that great King, who was sometime an exile as we are. With a religious salutation of our prayers, we (prostrate at your royal seet) beg pardon for this our boldness; craving sinally that our names may be enrolled among your Majesty's most humble subjects and suppliants.

JOHN ENDICOT, GOV.—In the name and with the confent of the General-court."

The state of Connecticut, and of Virginia, after the former had been settled 44 years, and the latter 64 years, may be learned from the following answers to the enquiries of the Lords of the Committee for the Colonies in 1680.

Of Connecticut. ' 1. We have two yearly general-courts, as they are stated in his Majesty's most gracious charter.—We have two courts of assistants, which consist of the Governor and Assistants, which are for the trial of capital ossenders, and for the hearing of all appeals with a jury.—Our colony is divided into four counties; and in each there are two county-courts annually, of magistrates and jury, to hear and determine all actions of debt, and the case, and criminal matters of a less nature.—As there is any special occasion the Governor calls his Assistants, who are of his council, and meet and consider of such matters, as fall in the interval of the general-courts, and determine the same.

' 2. The legislative power is only in the general court; the exe-

cutive is in those courts appointed, as before.

'3. We have little traffic abroad; and so, little occasion for a

Court of Admiralty, distinct from the Court of Assistants.

'4. We have sent one of our law books: wherein are what laws were of force when we printed them, since which some sew have been made which are not yet printed, and so have not sent them. Your Lordships may please to take notice, that, in our presace to our laws, we say we have been careful not to make any repugnant to the statute-laws of England, so far as we understand them: prosessing ourselves always willing to receive light for emendation; what we then said is our present purpose, and shall be our constant practice.

only one troop, which confilts of about fixty horse, but we are upon raising three more. Our forces are train-bands: in each county there is a Major, who commands its militia under the General.

In Hartford county there are 835. In Newhaven, 623.

New-London, - 500. Fairfield, 540.

The whole militia, 2507.

6. We have one small fort at the mouth of Connecticut river. Good towns we have; one especially, called New-London, formerly Pequot: near which the English obtained a memorable vistory over the Pequots; the first and most signal blow the Indians received. It greatly needs fortifications, but we want estates to raise them, and C 2

to purchase artillery: and we should thankfully acknowledge the favour of any good benefactors that would contribute to so good a work.

'7. It is rare that any privateers or pirates come on these dangerous coasts; only, two years ago, a French one wintered at New-

London, and went away in the spring.

<sup>6</sup> 8. As for our Indian neighbours; we compute them to be about 500 fighting men: we are strangers to the French, and know nothing of their strength or commerce. Our chief trade for procuring clothing is by sending what provisions we raise to Boston, where we buy goods. The trade with our Indians is worth nothing, because their frequent wars hinder their getting peltry.

o. We have neighbourly correspondence with New Plymouth, with Massachusets, since Major Andros came to New-York with him, but not like what we had with his predecessor: with Rhode Island we

have not such good correspondence as we defire.

6 10. Our boundaries are as expressed in the charter: we cannot guess the number of acres settled or manurable; the country being mountainous, sull of rocks, swamps, hills and vales; what is sit is taken up; what remains must be gained out of the fire, by hard blows, and for small recompence.

\* 11—13. Our principal towns are Hartford, New-London, New-haven, and Fairfield: our buildings are generally of wood; fome are of stone and brick; and some of them are of good strength, and comely, for a wilderness. We have twenty-six small towns already seated; and in one of them there are two churches.—Our rivers

are numerous and navigable.

\* 14—15. The commodities of the country are, provisions, lumber, and horses; but we cannot guess the yearly value: the most are transported to Boston, and bartered for clothing; some small quantity is sent to the Caribbee islands, and there bartered for products and some money: and now and then (rarely) vessels are laden and sent to Madeira and Fyal, and the cargoes bartered for wine. We have no need of Virginia trade; as most people plant so much tobacco as they need. We have good materials for ship building. The value of our annual imports probably amounts to 9000 l. We raise no salt-petre.

6 16—20. We have about twenty petty merchants; some trade to Boston, some to the Indies, and other colonies: but sew foreign merchants trade here. The number of our planters is included in our train-bands; which consist of all from 16 to 60 years of age. There are but sew servants, and sewer slaves; not above 30 in the colony. There are so sew English, Scotch, or Irish, come in, that we can give no account of them: there come sometimes three or sour blacks from Barbadoes, which are sold for 22! each. We do not know the exact number of persons born; nor of marriages; nor of burials: but the increase is as sollows: the numbers of men, in the year 1671, were 2050; in 1676, were 2303; in 1677, were 2362; in 1678, were 2490; in 1679, were 2507.

21-25. We cannot guess the estates of the merchants; but the property of the whole corporation doth not amount to 110,788 l. Rerling. Few vessels trade here but from Boston and New-York,

which

which carry off our produce. Twenty-four small vessels belong to the colony. The obstruction of trade is owing to want of estates, and to the high price of labour. Commerce would be improved, were New-London, Fairfield, and New-haven, made free ports for 15 or 20 years; this would increase the trade and wealth of this poor There are no duties on goods, exported or imported, except on wines and liquors; which, though inconfiderable, are ap-

propriated to maintain free-schools.

26-27. The people are strict Congregationalists; a few more, large congregationalists; and some, moderate Presbyterians: but the Congregationalists are the greatest number. There are about four or five Seven-day men, and about as many Quakers. Great care is taken of the infruction of the people in the Christian religion, by ministers catechizing and preaching twice every sabbath, and sometimes on lecture-days; and also by masters of families instructing their children and servants, which the law commands them to do. We have 26 towns, and there are 21 churches in them; and in every one there is a fettled minister, except in two newly planted. The stipend, which is more or less according to duty, is from 50 l. to 200 l. Every town maintains its own poor: but there is seldom any want, because labour is dear; being from 2s. to 2s. 6d. a day for a labourer; because provisions are cheap; wheat is 4s. a bushel Winchester, pease 3s. Indian corn 2s. 6d. pork 3d. a pound, beef 2 ½ d. a pound, butter 6 d. and so other matters in proportion: beggars and vagabonds are not suffered, but, when discovered, they are bound out to service; vagabonds, who pass up and down, are punished by law.

15 July, 1680.

WM. LEATE, Governor. Jnº. Allyn, Secretary.'

Of Virginia. 1-3. There are a Governor and fixteen Counfellors, who have from his facred Majesty a commission of over and terminer, and who judge all causes that are above 15 l. sterling. For what is under that value there are particular courts in every county, which are twenty in number. Every year at least the assembly is called; before whom lie appeals: and this assembly is composed of two burgesses out of every county. These lay the necessary taxes, as the necessity of the war with the Indians, or other exigencies, require. -In twenty-eight years there has not been one prize brought into this country; so that there is no need of a particular court of Admiralty.—The legislative and executive powers are seated in the governor, council, and affembly, and officers substituted by them.

4. The Secretary of this country fends every year to the Lord Chancellor, or one of the principal Secretaries of State, what laws are yearly made; which, for the most part, concern only our private exigence. For, contrary to the laws of England, we never did, nor dare, make any; only this, that no fale of land is good and legal, unless, within three months after the conveyance, it be recorded

in the general-court or county-courts.

6 5. All our freemen are bound to be trained every month in their particular county; which, we do suppose, and do not much mittake in the calculation, are near 8000. Horse we have mane; because they would be too chargeable for the poor people. . 6, 7.

C 3

6, 7. There are five forts: but, God knows, we have neither skill nor ability to make or maintain them. For there is not, nor, as far as my inquities can reach, ever was, one engineer in the country; so that we are at continual charge to repair inartificial buildings. There are not above thirty serviceable great guns; which we yearly supply with powder and shot, as our ability will permit. We have no privateers since the late Dutch war.

'8. We have no European neighbours seated nearer to us than St. Christopher's or Mexico, that we know of; except some sew French that are beyond New-England. The Indian neighbours are absolutely subjected; so that there is no sear of them. We have no correspondence with any European stranger, nor is there a possibility to have it with our own nation, farther than our traffic concerns.

one of the best guns dismounted, and fituated in a most unhealthy place, and where any enemy, if he knew the soundings, might keep out of the reach of the best guns in Europe. Before, or fince, we never had one great or small gun sent us, fince my coming hither, nor, I believe, in twenty years before: all that were sent by his sacred Majesty are still in the country, with a sew more that we bought. Besides these guns, we never had any money of his Majesty towards the buying of ammunition or building of sorts: but what can be spared out of the public revenue we yearly lay out in it.

f 11. As for the boundaries of our land: they were once great; ten degrees at least: but now it hath pleased his Majesty to confine us to half a degree; knowingly I speak this: pray God it may be

for his Majesty's service; but I much sear the contrary.

12—14. Commodities of the growth of this country, we never had any, till of late, but tobacco; which yet is confiderable, and yields his Majesty a great revenue. But of late we have begun to make silk; and so many mulberry-trees are planted, that, if we had skilful men from Naples or Sicily to teach us the art of making it, in less than half an age we should make as much silk, in a year, as England did yearly expend threescore years since; but now we hear it is grown to a greater excess, and of more common and vulgar usage.—Now, for shipping, we have admirable mass, and very good oaks; but, for iron ore, I dare not say there is sufficient to keep one iron-mill going for seven years.—Saltpetre we have none.—Rivers we have four; all able to harbour safely a thousand ships of any burden.

15, 16. We suppose, and I am very sure we do not much misseunt, that there is in Virginia above 40,000 persons, men, women, and children: of which there are 2000 black slaves; 6000 Christian servants for a short time; and the rest have been born in the country, or have come in to settle or serve, in hope of bettering their condition in a growing country. Yearly, we suppose, there comes in of servants about 1500; of which most are English, sew Scotch, and sewer Irish; and not above two or three ships of negroes in seven years.

f 17. All new plantations are, for an age or two, unhealthy till they are thoroughly cleared of wood; but unless we had a particular

register-

register-office, for the denoting all that die, I cannot give a particular answer to this query; only this I can say, that there are not ten unseasoned hands (as we term them) that die now: whereas, heretofore not one of five escaped the first year.

18. English ships, near eighty, come out of England and Ireland every year for tobacco; some few New-England kerches; but of our own we never yet had more than two at a time, and those not

more than twenty tons burden.

' 19, 20. Mighty and destructive have been the obstructions to our trade and navigation by that severe act of parliament which excludes us from having any commerce with any nation in Europe but our own; so that we cannot add to our plantation any commodity that grows out of it; as olive-trees, cotton, or vines: besides this, we cannot procure any skilful men for our now hopeful commodity of silk: and it is not lawful for us to carry a pipe stave, or a bushel of corn, to any place in Europe out of the King's dominions. If this were for his Majesty's service, or the good of the subject, we should not repine, whatever were our sufferings: but, on my soul, it is the contrary for both; and this is the cause why no small or great vessels are built here. For we are most obedient to all laws, whilst the New England men break through them, and trade to any place that their interest leads them to. I know of no improvement that can be made in trade, unless we had liberty to transport our pipe staves, timber, and corn, to other places besides the king's dominions.'

REMARK. The law did not prohibit what made Sir William fo un-

happy.

21, 22. No goods, either imported or exported, pay any duties here, only the 2s. a hoghead on tobacco exported, which is to defray all public charges: and this year we could not get an account of more than 15,000 hogheads. But of this revenue the King allows no toool. yearly; with which I must maintain the port of my place, and a hundred extraordinary charges that cannot be put into any public account: and I can knowingly assirm, that there is no government of ten years standing but is allowed thrice as much; but I am supported by my hopes that his Majesty will one day consider me.—There is no revenue arising to his Majesty, but out of the quitrents: and this he hath given away to a deserving servant, Colonel Henry Norwood.

23. The same course is taken here, for instructing the people, as there is in England: Out of towns every man instructs his own children according to his ability. We have forty-eight parishes, and our ministers are well paid, and by my consent should be better, if they would pray oftener and preach less: but, as of all other commodities, so of this, the worst are fent us, and we have sew that we can boast of, since the persecution in Cromwell's tyranny drove divers worthy men hither. Yet I thank God, there are no free schools, nor printing; and I hope we shall not have these hundred years. For learning has brought disobedience, and heresy, and seets into the world, and printing has divulged them and libels against the best government: God keep us from both?

Virginia, 20 June, 1671.

WILLIAM BERKELBY."

If there be any spirits, still remaining, congenial with that of Sir William Berkeley, who are disposed to say Amen to this wife and pious prayer; let them no longer despair of suppressing " fects, herefies, and disobedience:" they have nothing more to do, than to make fufficient interest in Parliament for passing an Act—to abolish schools, and prohibit the use of the art of printing.

This volume brings down the history of the United Colonies to the time of the Revolution: in the next, the Author proposes to continue it to the Peace in 1763.

ART. IV. Objervations made during a Tour through, Parts of England, Scotland, and Wales. In a Series of Letters. 4to. 10s. 6d. Boards. Becket. 1780.

N this tour-making age, different travellers are excited by different motives. One is prompted by curiofity; another is urged by business, or the pursuit of health; others set out in fearch of that amusement which they cannot meet with by staying at home; and there are, who industriously go forth in search of materials to make a book.

In the first of these classes we must rank the Author of the Observations now before us. We are informed that he is a man of fortune, who, very laudably, wished to see, and to know, what is worth feeing and knowing, in his own country,—a part of the globe which the young English Traveller generally over-

looks in perusing the map of the GRAND TOUR.

To go, to see, and to forget, is commonly the sum total of what is performed by those who travel for amusement; but our Observer, unwilling to lose the advantages which he might de-. rive from his excursions, resolved to treasure up whatever was worthy of remembrance: in order to which, he has thrown his remarks, as they occurred, into the form of a Series of Letters, addressed to a friend, who had enjoined him to communicate, in detail, the fruit of his researches.—" But here, then," our Readers will fay, "is a book produced, Mr. Reviewer! which may bring the Author to rank with your last mentioned classthe Tour-maker by profession, or trade."-True, this may seem to be the case; but we know that it is not so, in fact: the pablication before us owes its existence, not to lucrative views, but to a motive of pure benevolence; the profits arifing from the sale being appropriated to answer a purpose, pointed out to the generous Author by the finger of Humanity.

With regard to the literary abilities of our Observator, we have to commend his vivacity, his fentimental turn, and his good taste. He writes, as most Gentlemen-travellers will write, not having the business of publication in view,—whose end is

their

\* Written by Richard | Sullivan, Esq. ?

their own entertainment,—and who put down their observations as they flow—currente calamo, and currente vehiculo, at the inn, or on the road.

In his manner, this agreeable but not very profound writer feems akin to the Shandy-family: lively, good-humoured, and benign,—an happy mixture of mirth with the milk of human kindness.

But though the style of this sentimental describer is pleasant, he gives us, as Critics, much cause of complaint, on account sometimes of his frivolity, but much oftener of his incorrectness; in which last respect he is faulty, even to an extreme. It is, indeed, surprising, that a person of education, reading, and taste, could be so inattentive to his native language, as this gentleman appears to have been; or that, if he was himself averse to what he might deem the drudgery of filing and polishing, he did not employ some friend, or polisher by profession, to do the work for him! but more of this in the note.

As

Of the tender and pathetic take the following: "Hail gentle courtefy!—Thy dimpled smile dost beckon us as we journey it along

-Then scatterest roses to the shorn lamb."

A picture of Jane shore is "admirable not so much for its execution or design, as for its beauty, humility and resignation, which are divinely worked into the countenance."

Rembrandt's fine picture of Daniel before Nebuchadnezzar, at Lord Scarsdale's, is "a most highly sinished picture, especially the crapery, though Daniel's hair and the apparel in general is preposterous."

A catalogue of the bastos, &c. at Wilton takes up eleven pages;

A catalogue of the buftos, &c. at Wilton takes up eleven pages; the journey from Belford (or Belfort as he calls it) in Northumberland to Edinburgh is described in eight lines.

Lumley Castle, the venerable seat of Lord Scarborough, is converted into Ludlew Castle, and is said to contain nothing worthy ob-

A Correspondent, who seems, indeed, to have too seriously taken offence at our Author's inadvertencies and slips of expression, has noted some desects in the following terms:——'It is surprising, says he, that his [the Author's] own ear should not be hurt by such expressions as, every here and there;—from here; or by the continual repetition of the word bewever, which occurs in almost every page, sometimes four times in twenty lines. We next came to—we next arrived at—next ascended, are savourite expressions. Having concluded—baving arrived—being arrived—follow one another in quick succession. Wardour is nist magnificent, then too low, then beauty, and at last, void of elegance. Groves ereal themselves. A little building is afterwards said to be a pump. i. e. A pump is placed round the head of the Stour. Stourton is a lordship of very old creation. They advanced upon a bridge of one arch, wonderfully easy of ascent. Salisbury cathedral is in form of a lanthorn, Southampton is a village, Longleat and Haddon are castles.

As a specimen of this performance, we shall give the ingenious though careless Author's account of his adventure in exploring a vast cavern in Derbyshire, seldom mentioned by those who have described "the wonders of the Peake."—After relating what he saw in Poole's Hole, and in the cavern vulgarly called "the D—I's A—e in the Peake," but here styled Peake's Hole, our Author and Co. were tempted to visit The three Mile Cavern, which is supposed to communicate, at least by the stream of water, with Peake's Hole; this we gather from the description before us,—if we have not mistaken it. We shall here give the 18th letter entire.

August 1778. "The last place I parted with you from was Peake's Hole, and there you will naturally have concluded that our underground workings had been at an end. But alas! my friend, fate had otherwise ordained it; the spirit of curiosity had warped our rational faculties; danger had become familiar to us, and we therefore determined upon a plan that wifer men would have shuddered at the idea of. was no less than the exploring the three-mile cavern which I have already mentioned. Summoning therefore a posse-comitatus of all she miners of the place, we in brief told them our intention. Aftomithment at first prevented them from answering us; none but two or three had ever ventured upon a trial; custom even had not reconciled the others to fo hazardous an enterprize. A promise of reward, however, prevailed upon the whole, and they accordingly agreed to attend us in the morning. In the mean time a messenger being dispatched to Sheffield for torches, we began feriously to prepare for our descent; this was soon accomplished. A paper of memorandums was lest in our escrutores, and a card, in case of an accident, telling who our friends were, and where they were to be found, was left upon our table in the inn. Thus guarding against the worst that could befal us, at least so far as it respected matters

fervation excepting a painting of Sir Thomas More. The judicious, the informing, Mr. Pennant fays, "it is a noble repository of portraits."

which

<sup>\*</sup> Netherby, changed into Leatherby, was not visited (by travellers of curiosity too who were so near as Carl.sle), and the owner is dignified with a peerage. Would this summons intitle him to take his seat in the House of Peers, there is no doubt he would receive the travellers in their next tour, with the dimpled smiles of gentle courtes.

Mr. Duncomb's collection of pictures is known to be a fine one; this gentleman fays, the pistures are in general good. The terrace at Duncomb Park is flightly mentioned, but Rivers Abbey totally omitted.

So far our Correspondent, who, unluckily for this performance, does not seem to have perused it when he was in the humour to be eafily pleased. We have not printed the whole of his letter: not chusing to give too much "way and room," as Shakespear says, to any man's assertites but our own.

which we might leave behind, we early the next morning, accompanied by a chosen set of our new guides, repaired to the top of the mountain, where the fiffure opened itself about three feet in diameter. Provided by the miners with proper dresses, we then stripped ourselves of our own outward apparel, and putting on each a pair of canvas trowfers, a flannel jacket, and over that a canvas frock, with a handkerchief round our heads, and a miner's cap, we all proceeded one by one down this dread abys, for the distance of about tour hundred and twenty feet perpendicular. Imagination can fcarcely form a descent more perilous than this was. The only steps to tread on, or things to hold by, were bits of oak fluck into the fides, inhabitants of that place fince it was first discovered, and which from want of nie, it was natural to suppose might have either rosted or loosened themselves in the earth; moreover, a salse step hurled one inevitably to destruction: fortunately all was firm, and we arrived at the bottom unhurt. From hence, ranging ourselves in order, with a large bundle of candles and torches, independent of the candles we each of us carried, we proceeded on with tolerable facility through two or three lofty and most beautifully enamelled caverns of spar. This we conceived an earnest of future delight, and the tablets were accordingly fet at work; but, alas! how great was our mistake! Here our difficulties were to commence. Following the guide, who besides another who was with us, were the only two of the party who had ever penetrated before, we forced our way with infinite struggles, through a narrow space, between two rocks, and thence getting on our hands and knees, were, for the full distance of a mile, obliged to crawl without ever daring to lift up our heads, the passage being too low. Filled with mud, dirt, and a multitude of bits of rocks, our progress was painful indeed: we still, however, hoped for something better. On we accordingly proceeded, till a dreadful noise, rumbling along the horrible crevices of the cave, gave us to underfland that we were near a river: to this then we accordingly hurried. But description is inadequate to any thing like a representation of this scene. A vast ocean seemed roaring in upon us; in some places buriting with inconceivable impetuofity, and at others falling through dreadful chasms, naturally formed to give it vent : through this our journey was to continue. A cry of light, however, alarmed us: the confinement of the air, and the narrowness of our track, had extinguished all our torches; the candles too, all but one small end, were totally expended. We knew not what to do. In vain the miners hallooed for the supply which was to have come behind; no answer was to be heard. Our fate teemed now inevitable; but we who were the principals, fortunately expressed no fear. In this extremity a gallant fellow, who yet was ignorant of the place, but from experience knew the danger we were in, suddenly disappeared, and after groping for a considerable time in the dismal norrors of the place, at length returned to us with a supply of candles, having discovered his companions unto whom they were given in charge, almost petrified with fear, and unable to continue after us from their apprehensior. Reprieved in this manner from a death which seemed to await us, in its most horrid form, we onward proceeded with a fresh recruit of spirits; and plunging into the river above our waists, scarce tenable from the impetuofity of the torrent, we cautiously picked our fleps, and, at length, after a four hours most unspeakable fatigue, arrived at about three hundred yards beyond the spot, where the subterranean passage we had the day before explored, was expected to find an en-

trance into this dreadful place.

" Here then we were obliged to stop, a fall into a yawning gulph, in which I was providentially faved by a corner of a rock catching me by the knee, had hitherto given me an inconceivable degree of pain; but I had not spoke; it now became scarce bearable; out however I was to crawl, and that too upon this tortured limb. retreat accordingly began; but no anguish could surpass the excess of torment I was in. Often did I wish to remain where I was; no succour or assistance could be given me: every man was painfully busied in the charge of his own safety. At length, having almost worn out the other knee, and torn both my fides and back by forcing myfelf in those positions, I was compelled to call out for help, as we happily came to the first opening where I could be raised. Languor and faintness from what I had suffered, had totally deprived me of my strength: I was accordingly seated on a rock, but in a few minutes, having collected myself as much as possible, I tottered through the rest of the cavern, helped where assistance could be given me, and in that manner got to the bleffed funshine of the day. All the reft, however, were tolerably well, excepting two of our guides, one of whom had received a violent contusion on his head from a rock; and another several bruises from a fall, in his climbing up the last aperture. Altogether, the depth we had descended was about one hundred and forty fathom, or nine hundred and eighty feet, and the length about three miles, according to the miners calculation. Neither at this distance were we at the end; a passage still continued, but so filled with water, and so full of peril, that the miners themselves were averse to further trial. And here, my friend, I will take my leave of you for the present. The pains in my limbs are still excruciating, but a little time will set all to rights again; all I have to say is, that I never wish even the greatest enemy I have in the world to be so unpardonably led by curiosity as to tempt destruction, where, independent of the dangers of the place, the falling of a fingle stone might bury him in eternity for ever.

We have copied this under-ground excursion at length, because we look upon it as a curiosity; no description of this three-mile cavern having, that we recollect, been given by pre-

ceding writers.

Many other entertaining extracts might be made, from various parts of this itinerary; but we have not room to enlarge.

We must not, however, bid adieu to this agreeable road-companion, without hinting to him a particular correction or two, beside those which are pointed out by our Correspondent, in the note. These may prove to be of some use to him, in case of a second edition; and should a new impression be called for, the name of the Author affixed would certainly be of advantage, with regard to the reception which the Public might then give

to the work. Anonymous productions have feldom an equal chance of fuccess: they have nothing to depend on, but real intrinsic merit; and even that may chance to be over-looked, in the crowd of unowned publications.

The passages we have marked for the Author's reconsidera-

tion, in the work before us, are the following:

P. 11, line 4. 'She, loved girl, was almost equally as sensekes.'-P. 21, l. 14. 'His incitements to virtue are equally as strong.' P. 23. Speaking of Cliefden House, and Buckingham House in St. James's Park, our Author mistakenly says, they were both built by George Villiers, Duke of Buckingham. We believe, that the first mentioned structure was raised by the celebrated Villiers, but the latter, now called the Queen's Palace, was undoubtedly built by John Sheffield, Duke of Bucks. P. 30, 1. 10. Within a small distance are some tolerable coalpits: we are at a loss to guess in what respects a coal-pit can be deemed tolerable or intolerable. P. 33. The windows of the chapel in Wells Cathedral are faid to be too much darkened by the profusion of glass: this is an effect which we apprehend sew readers of these Observations will be able to conceive, without some explanation. P. 36, l. 21, 'hung pendant': here is an explanation of one word by another, which was not wanted. P. 40, 1. 12, 'the number of travellers have [for bath] of late years decreased.' P. 42. Speaking of the Glastonbury thorn, we are told, that this tree ' is of a remarkable species in this country; but that it is common to a degree in the Levant and Asia Minor. This cant phrase gives us no idea to what degree the tree in question is common in the Levant, &c. P. 91, 'The counties of Somerset and Gloucestershire. P. 93, The prospect from Clifton-hill 'romantic and delightful to a degree.' We recollect no instance of fmall talk looking well in print, but in the volume of Swift's Polite Conversation. P. 101, we read of a small room erected by itself. By this, no doubt, we are only to understand that no other buildings were very near.

P. 118, The infide of Gloucester cathedral is 'clumsy to a degree. P. 125, l. 18, for pairing, should we not read pareing? P. 140, Birmingham, it is said, was, a few years ago, 'but an inconsiderable dirty village.' Camden would have told our Author, that, two hundred years ago, "Bremicham was swarming with inhabitants, and echoing with anvils, &c." Our Author adds, that 'its situation in Warwickshire, and on the borders of Staffordshire, gives it considerable advantages; but of what kind those advantages are, we are left to guess, without the smallest clue to guide us. P. 149, for Akover, read Okeover: by the country people pronounced Oker. P. 152, 'Proceeded on to Buxton, through a country as barren and desolate as one can well be conceived.'—Perhaps some of the above are mere

Aips of the press.

ART. V. An Fsfay on History; in Three Episses to Edward Gibbon, Esq. By William Hayley, Esq. With Notes. 4to. 7s. 6d. Dodsley. 1780.

TE are happy to find this new star in the poetical hemisphere, whose appearance we noted with so much pleafure, continues to shine, if possible, with increasing splendor. The province of literature affords hardly any subject of critical discussion that is of higher dignity and importance than that to which Mr. Hayley has now directed his attention. Simple and obvious as the rules of history may appear to a superficial obferver, there are difficulties in the application of them that are in a great measure insurmountable; otherwise a persect historian would not have been so long considered as a literary prodigy. It will be found, however, if the matter be minutely examined into, that to be qualified for the composition of history will require talents and accomplishments that rarely are united: there is scarcely, indeed, any quality by which the human mind can be dignified or adorned, any excellence intellectual or moral, but will in some degree, either immediately or remotely, be requisite in the man who shall aspire to the title of a complete historian. To delineate this character, and to point out the rules and precepts of his art, is the business of this admirable didactic Essay.

The first Epistle opens, after a sew introductory lines applicable to the gentleman to whom it is addressed, with the connection between history and poetry. The subject of the present poem, he observes, has been but slightly touched by the ancients; Dionysius of Halicarnassus and the inimitable Lucian being the only writers who have professedly treated of it. Having remarked the importance and advantage of history, he then traces its origin and progress from Ægypt into Greece. In his account of the Pyramids he has adopted, as he acknowledges in a note, the idea of Mr. Bryant; but the sublime and magnificent imagery, in which he has clothed it, is his own.

But in the center of those vast abodes, Whose mighty mass the land of Egypt loads; Where, in rude triumph over years unknown, Gigantic Grandeur, from his spiry throne, Seems to look down disdainful, and deride The poor, the pigmy toils of modern Pride; In the close covert of those gloomy cells, Where early Magic fram dher venal spells, Combining priests, from many an ancient tale, Wove for their hallow'd use Religion's veil; A wondrous texture! supple, rich, and broad, To dazzle Folly, and to shelter Fraud! This, as her cæstus, Superstition wore; And saw th' enchanted world its powers adore:

For in the myslic web was every charm To luce the timid, and the bold disarm; To win from easy Faith a blind esteem, And lull Devotion in a lasting dream. The Sorceress, to spread her empire, drest History's young form in this illusive vest, Whose infant voice repeated, as she taught, The motley fables on her mantle wrought; Till Attic Freedom brought the Foundling home From the dark cells of her Egyptian dome; Drew by degrees th' oppressive veil aude, And, shewing the fair Nymph in nature's pride, Taught her to speak, with all the fire of youth, The words of Wisdom in the tone of Truth; To catch the palling shew of public life, And paint immortal scenes of Grecian strife.'

t the close of this Epistle, the historians of Italy and Greece tharacterized with singular spirit and discernment. Of these, last whom he mentions is Anna Comnena, eldest daughter he Emperor Alexius Comnenus and the Empress Irene, sourished at the latter end of the eleventh century. She the History of her Father in 15 books, first published in 2, and afterwards reprinted in the collection of the Byzanhistorians. As this fair historian, who, Mr. Hayley observe may justly be regarded as a singular phenomenon in the 15 world, is not generally known, we shall subjoin the

pliment which he has here paid to her memory.

But while Monastic Night, with gathering shades. The ruin'd realm of Hittory invades; While, pent in Constanting's ill-fated walls, The mangled form of Roman Grandeur falls; And, like a Gladiator on the fand, Props his faint body with a dying hand; While savage Turks, or the fierce sons of Thor, Wage on the Arts a wild Titanian war; While manly Knowledge hides his radiant head, As Jove in terror from the Titans fled; See! in the lovely charms of female youth, A second Pallas guards the throne of Truth! And, with Comnena's royal name imprest, The zone of Beauty binds her Attic vett! Fair star of Wisdom! whose unrival'd light Breaks thro' the stormy cloud of thickest night; Tho' in the purple of proud misery nursl, From those oppressive bands thy spirit burft; Pleas'd in thy public labours, to forget The keen domettic pangs of fond regret! Pleas'd to preserve from Time's destructive rage, A Father's virtues in thy faithful page! Too pure of foul to violate or hide Th' Hittorian's duty in the Daughter's pride!

Tho' base Oblivion long with envious hand Hid the fair volume which thy virtue plann'd, It shines, redeem'd from Ruin's darkest hour, A wond'rons monument of semale power; While conscious Hist'ry, careful of thy same, Ranks in her Attic band thy silial name, And sees, on Glory's stage, thy graceful mien Close the long triumph of her ancient scene!

The Preface to her History, in which "she feelingly displays the misfortunes of her life, and the character of her mind," is truly curious and valuable. Of this Mr. Hayley has given a

granslation in his Notes.

The second Epistle is chiefly appropriated to the moderns. After considering our obligations to the more rational of the Monkish historians, and the indulgence due to writers of the dark ages, he contemplates the twilight of knowledge during the period of chivalry and romance, of which the principal luminary was Froissart. He then adverts to the revival \* of ancient learning, the day-break of literature, under Leo X. The characters that now come in review are Machiavel, Guiccardin, Davila, Father Paul, the classical Portuguese Bishop Clorius, the Spanish historian Mariana, the President De Thou, and Voltaire, whose portrait we shall exhibit.

Delighted Nature saw, with partial care,
The lively vigour of the gay VOLTAIRE;
And fondly gave him, with ANACREON's fire,
To throw the hand of Age across the lyre:
But mute that vary'd voice, which pleas'd so long;
Th' Historian's tale is clos'd, the Poet's song!
Within the narrow tomb behold him lie,
Who fill'd so large a space in Learning's eye!
Thou Mind unweary'd! thy long toils are o'er;
Censure and Praise can touch thy ear no more:
Still let me breathe with just regret thy name,
Lament thy soibles, and thy powers proclaim!
On the wide sea of letters 'twas thy boast

On the wide sea of letters twas thy boast
To croud each sail, and touch at every coast:
From that rich deep how often hast thou brought
The pure and precious pearls of splendid Thought I
How didst thou triumph on that subject tide,
Till Vanity's wild gust, and stormy Pride,
Drove thy strong bark, in evil hour, to split
Upon the satal rock of impious Wit!
But be thy failings cover'd by thy tomb!
And guardian laurels o'er thy asses bloom!
From the long annals of the world thy art,
With chemic process, drew the richer part;

It may not be foreign to remark, that a copious and well-written history of the Revival of Letters would be a valuable acquifition to English literature.

To Hist'ry gave a philosophic air, And made the interest of mankind her care; Pleas'd her grave brow with garlands to adorn, And from the rose of Knowledge strip the thorn.

The English historians are next introduced.

" Hail to thee, Britain! hail! delightful land! I spring with filial joy to reach thy strand: And thou! blest nourisher of Souls, sublime As e'er immortaliz'd their native clime, Rich in Poetic treasures, yet excuse The trivial offering of an humble Muse, Who pants to add, with fears by love o'ercome, Her mite of Glory to thy countless sum! With vary'd colours, of the richest die, Fame's brilliant banners o'er thy Offspring fly: In native Vigour bold, by Freedom led, No path of Honour have they fail'd to tread: But while they wifely plan, and bravely dare, Their own atchievements are their latest care. Tho' CAMDEN, rich in Learning's various store, Sought in Tradition's mine Truth's genuine ore, The waste of Hist'ry lay in lifeless shade, Tho' RAWLEIGH's piercing eye that world survey'd. Tho' mightier Names there cast a casual glance, They seem'd to saunter round the field by chance, Till CLARENDON arose, and in the hour When civil Discord wak'd each mental Power, With brave desire to reach this distant Goal, Strain'd all the vigour of his manly foul. Nor Truth, nor Freedom's injur'd Powers, allow A wreath unspotted to his haughty brow: Friendship's sirm spirit still his same exalts, With sweet atonement for his lesser faults. His Pomp of Phrase, his Period of a mile, And all the maze of his bewilder'd Style, Illum'd by Warmth of Heart, no more offend: What cannot Taste forgive, in FALKLAND's friend? Nor-flow his praises from this single source; One province of his art displays his force: His Portraits boast, with features strongly like, The fost precision of the clear VANDYKE: Tho', like the Painter, his faint talents yield, And fink embarrass'd in the Epic field, Yet shall his labours long adorn our Isle, Like the proud glories of some Gothic pile: They, tho' constructed by a Bigot's hand, Nor nicely finish'd, nor correctly plan'd, With solemn Majesty, and pious Gloom, An awful influence o'er the mind assume; And from the alien eyes of every Sect Attract observance, and command respect.

Rav. July, 1780.

In following years, when thy great name, Nassau! Stampt the bleft deed of Liberty and Law; When clear, and guiltless of Oppression's rage, There rose in Britain an Augustan age, And cluster'd Wits by emulation bright, Diffus'd o'er Anna's reign their mental light; That Constellation seem'd, tho' strong its stame, To want the splendor of Historic same: Yet Burnet's page may lasting glory hope, Howe'er insulted by the spleen of Pore. Though his rough Language haste and warmth denote, With ardent Honesty of Soul he wrote; Tho' critic censures on his work may shower, Like Faith, his Freedom has a saving power.

Nor shalt thou want, RAPIN! thy well-earn'd praise; The fage PolyBius thou of modern days! Thy Sword, thy Pen, have both thy name endear'd; This join'd our Arms, and that our Story clear'd: Thy foreign hand discharg'd th' Historian's trutt, Unsway'd by Party, and to Freedom just. To letter'd Fame we own thy fair pretence, From patient Labour, and from candid Sense. Yet Public Favour, ever hard to fix, Flow from thy page, as heavy and prolix. For foon, emerging from the Sophists' school, With Spirit eager, yet with Judgment cool, With subtle skill to steal upon applause, And give false vigour to the weaker cause; To paint a specious scene with nicest art, Retouch the whole, and varnish every part; Graceful in Style, in Argument acute; Maller of every trick in keen Dispute! With these strong powers to form a winning tale, And hide Deceit in Moderation's veil, High on the pinnacle of Fashion plac'd, HUME shone the idol of Historic Taste. Already, pierc'd by Freedom's fearching rays, The waxen fabric of his fame decays.-Think not, keen Spirit! that these hands presume To tear each leaf of laurel from thy tomb! These hands! which, if a heart of human frame Could stoop to harbour that ungenerous aim, Would shield thy Grave, and give, with guardian care, Each type of Eloquence to flourish there! But Public Love commands the painful task, From the pretended Sage to strip the mask, When his false tongue, averse to Freedom's cause, Profanes the spirit of her ancient laws. As Asia's soothing opiate Drugs, by stealth, Shake every flacken'd nerve, and sap the health; Thy Writings thus, with noxious charms refin'd, Seeming to soothe its ills, unnerve the Mind.

While

While the keen cunning of thy hand pretends To strike alone at Party's abject ends, Our hearts more free from haction's Weeds we feel, But they have lost the Flower of Patriot Zeal. Wild as thy feeble Metaphysic page, Thy Hist'ry rambles into Sceptic rage; Whose giddy and fantastic dreams abuse A HAMPDEN'S Virtue, and a SHAKESPEAR'S Mule. With purer Spirit, free from Party ftrife, To foothe his evening hour of honour'd life, See candid Lyttelton at length unfold The deeds of Liberty in days of old! Fond of the theme, and narrative with age, He winds the lengthen'd tale thro' many a page; But there the beams of Patriot Virtue shine; There Truth and Freedom sanctify the line, And laurels, due to Civil Wisdom, shield This noble Neftor of th' Historic field.'

To point out, to Readers of taste, the masterly touches of the pencil and the strength of colouring that are observable in these, and indeed all his portraits, would be needless. The characters of Hume and Clarendon are of peculiar excellence. The comparison between the labours of the latter historian and

—The proud glories of some Gothic pile is singularly happy. He avoids entering into the merits of any living historian, for reasons that are obvious.

In the last Epistle, the Author, confining himself more closely to his subject, considers the source from whence are derived the chief defects of history. These are vanity, national and private stattery, party spirit, superstition and salse philosophy. The influence of national vanity is exemplified in the application of prodigies and portents to the purposes of history.

' To seize this soible, daring Hist'ry threw Illusive terrors o'er each scene she drew; Nor would her spirit, in the heat of youth, Watch, with a Vestal's care, the lamp of Truth; But, wildly mounting in a Witch's form, Her voice delighted to condense the storm; With showers of blood th' astonish'd earth to drench, The frame of Nature from its base to wrench; In horror's veil involve her plain events, And shake th' affrighted world with dire portents. Still softer arts her subtle spirit try'd, To win the easy faith of Public Pride: She told what Powers, in times of early date, Gave consecration to the infant State; Mark'd the blest spot by sacred Founders trod, And all th' atchievements of the guardian God. Thus while, like Fame, the rests upon the land, Her figure grows; her magic limbs expand;

Her tow'ring head, towards Olympus tost, Pierces the sky, and in that blaze is lost.

In a note on this passage, Mr. Hayley observes, there is 2 curious treatise of Dr. Warburton's on this subject, which is become very scarce; it is entitled, "A critical and philosophical " Enquiry into the causes of prodigies and miracles, as related by "Historians, with an Essay towards restoring a method and purity in History." It contains, like most of the compositions of this dogmatical Writer, a strange mixture of judicious criticism and entertaining absurdity, in a style so extraordinary, that I think the following specimens of it may amuse a Reader who has not happened to meet with this fingular book —Having celebrated Raleigh and Hyde, as writers of true historic genius, he adds: "Almost all the rest of our Histories want Lise, Soul, Shape, and Body: a mere hodge-podge of abortive embryos and rotten carcales, kept in an unnatural ferment . (which the vulgar mistake for real life) by the rank leven of prodigies and portents. Which can't but afford good diversion to the Critic, while he observes how naturally one of their own fables is here mythologized and explained, of a church-yard carcase, raised and set a strutting by the instation of some hellish succu-bus within." He then passes a heavy censure on the antiquarian publications of Thomas Hearne; in the close of which he exclaims—" Wonder not, Reader, at the view of these extrava-gancies. The Historic Muse, after much vain longing for a vigorous adorer, is now fallen under that indisposition of her fex, so well known by a depraved appetite for trash and cinders." -Having quoted two passages from this singular Critic, in which his metaphorical language is exceedingly gross, candour ob-

And blazons virtue in her bright record. E. I. 1. 95. The tuneful record of her oral praise. E. I. 1. 117. Has drawn distinctly in her clear record E. II. 1. 67.

We apprehend the emphasis is improperly thrown upon the last syllable: analogical propriety, as well as general custom, pointing out a different mode of pronunciation than that which is here adopted. In all prepositions, compounded as this is, the emphasis is universally laid on the first syllable; and the reason seems to be, that the word, when thus compounded, takes its peculiar and determinate meaning from that syllable. Forward, onward, upward, downward, backward, &c. or, as they are also written, forwards, enwards, &c.; to these may be added also, froward and toward, in their moral acceptation. A liberty of the same kind has been taken with another word, about which, indeed, writers are more divided.

Would thus pollute the records of our ifle. E. III. 1. 328. Analogy and custom in this instance seem to be at variance. Whichever authority is preserved, we think it should be adhered to; for a writer to use different modes of pronunciation promiscuously, adds much to the consuston and uncertainty of language.

liges me to transcribe another, which is no less remarkable for elegance and beauty of expression. In describing Sallust, at one time the loud advocate of public spirit, and afterwards sharing in the robberies of Cæsar, he expresses this variation of character by the following imagery:—" No sooner did the warm aspect of good fortune shine out again, but all those exalted ideas of virtue and honour, raised like a beautiful kind of frost-work, in the cold season of adversity, dissolved and disappeared."

The manly strain of virtuous indignation which breaks out in the following passage merits at this time particular attention: it is such as every one must join in, who is not actuated by the same mean and contemptible servility which it is intended to

reprobate.

But arts of deeper guile, and baser wrong,
To Adulation's subtle Scribes belong:
They oft, their present idols to exalt,
Profanely burst the consecrated vault;
Steal from the buried Chief bright Honour's plume,
Or stain with Slander's gall the Statesman's tomb:
Stay, sacrilegious slaves! with reverence tread
O'er the blest ashes of the worthy dead!
See! where, uninjur'd by the charnel's damp,
The Vestal, Virtue, with undying tamp,
Fond of her toil, and jealous of her truit,
Sits the keen Guardian of their sacred dust,
And thus indignant, from the depth of earth,
Checks your vile aim, and vindicates their worth:
"Hence ye! who buried excellence belied,
"To sooth the fordid spleen of living Pride;

"Go! gild with Adulation's feeble ray
"Th' imperial pageant of your passing day!

"Nor hope to flain, on base Detraction's scroll,
"A Tully's morals, or a Sidney's soul!"— "

Towards the conclusion, he pays a very just and elegant compliment to Mr. Gibbon, not without a severe censure on his polemical opponents. The irreligious spirit, however, of his friend's writings he by no means defends or approves: he has hinted at it with a delicacy of reproof that is likely to ope-

<sup>·</sup> Nor hope to stain, on baje Detraction's scroll,

A Tully's morals, or a Sidney's foul!] Dion Cassius, the fordid advocate of despotism, endeavoured to depreciate the character of Cicero, by inserting in his History the most indecent Oration that ever disgraced the page of an Historian. In the opening of his 46th book, he introduces Q. Fusius Galenus haranguing the Roman senate against the great ornament of that assembly, calling Cicero a magician, and accusing him of prostituting his wife, and committing incest with his daughter. Some late historical attempts to fink the reputation of the great Algernon Sidney, are so recent, that they will occur to the remembrance of almost every Reader.

rate upon an ingenuous mind much more than the rusty cudgels of a thousand sturdy Polemics.

But O! what foes beset each honour'd Name, Advancing in the path of letter'd same! To stop thy progress, and insult thy pen, The sierce Polemic issues from his den.

Think not my Verse means blindly to engage In rash desence of thy prosaner page! Tho' keen her spirit, her attachment sond, Base service cannot suit with Friendship's bond; Too sim from Duty's sacred path to turn, She breathes an honest sigh of deep concern, And pities Genius, when his wild career Gives Faith a wound, or Innocence a fear. Humility herself, divinely mild, Sublime Religion's meek and modest child,

Sublime Religion's meek and modest child,
Like the dumb Son of Croesus, in the strife,
Where Force assail'd his Fa her's facred life,
Breaks silence, and, with fillal duty warm,
Bids thee revere her Parent's hallow'd form!'

After the very ample specimens that have been given of this excellent performance, it seems in a great measure superstuous to say what are our sentiments of it. In the disposition and conduct of his poem, Mr. Hayley has shewn consummate knowledge of his subject; and his language, though not only figurative and glowing, but oftentimes daringly metaphorical, has all the ease and elegant familiarity of epistolary composition. The choice and application of similes has ever been considered as one great test of the poet's art: if by this criterion we examine the poem before us, it will be sound to possess almost unrivaled excellence; and the sentiments and imagery are such as could only be expected from an imagination truly creative, regulated by a judgment critically exact.

The notes, with which this poem is enriched, are learned and valuable.

HETHER we consider the volumes that Mr. Young has written, or the miles that he has travelled, we shall find no Author whose labours can any way come in competition with those of this indefatigable Compiler; and if, as he himself acknowledges, he has been reproached for being tedious,

ART. VI. A Tour in Ireland; with general Observations on the present State of that Kingdom: made in the Years 1776, 1777, and 1778. And brought down to the end of 1779. By Arthur Young, Eq.; F.R.S. Honorary Member of the Societies of Dublin, York and Manchester; the Occonomical Society of Berne; the Palatine Academy of Agriculture at Manheim, and the Physical Society at Zurich. 4to. 11.1s. Boards. Cadell. 1780.

it must at the same time be consessed, that had he treated his subject less circumstantially, and in detail, 'his works would but indifferently answer the end, to accomplish which, he has

travelled, practised, and written.

There is no doubt but in his Tours (certainly his most valuable publications) many things appear which might have been omitted, and others are related in such terms as, in the cooler moments of enquiry, are found to have been exaggerated; there is, nevertheless, more information to be collected from them than from any other books on the subject that are extant; nor can there be the least doubt but they have already proved of very considerable benefit, in introducing many improvements into general use, which were before confined to a particular province, or individual.

Though the country through which we are now attending this intelligent and communicative traveller be some centuries behind us in agricultural improvement, we shall, no doubt, meet with many things worth observation, there being, as he justly remarks, no people existing so backward but have some

good practices to copy, as well as errors to avoid.

Mr. Young's narrative commences at Dublin; which city having been frequently described, our attention will be more particularly directed to that part of his itinerary which speaks of

places and customs not so generally known.

Not only as a matter of curiofity, but also to shew what those gentlemen have to contend with who attempt to introduce more improved systems of farming, we shall insert the following picture of Irish agriculture, which though possibly not general, does not at the same time appear, as we learn from different

parts of this work, to be fingular.

The farms around Westport, the seat of Lord Altamont, are in general large, from 400 acres to 4 or 5000, all which are stock farms; and the occupiers re-let the cultivated lands, with the cabb us, at a very increased rent, to the oppression of the poor, who have a strong eversion to renting these tierney begs. The soil in general is a cold, spewy, stonev clay and loam; the best lands in the country are the improved moors. Rents rife from 2 s. for heath, to 10 s. for good land. Average 8's, about three-fifths of the country unimproved mountains, bug and lake. Great tracts of mountain, but bogs not very extensive. Clara island 2,400 acres, at 300 l. a year; Achill 24,000 acres, at 200 l. a year; Bofin 100 l. a year, and is above 1200 acres. It belongs to Lord Clanrickard. The course of this country, 1. Potatoes, manured with sea-weed; this is so strong that they depend entirely on it, and will not be at the trouble to carry out their own dunghills. On the shore, towards Joyce's country, they actually let their dungbills accumulate, till they become fuch a missance, that they move their cabbins in order to get from them. A load of wrack is worth, at least, fix loads of dung. They do not take half what is thrown in. On the shore, open to the Atlantic, there is a D 4 leather

leather fort of Alga, which comes in in the spring. The kelp weed grows only where it is sheltered. The coast of Lord Altamont's domain and islands let for 100 l. a year for making kelp.

1. Potatoes. 2. Barley. 3. Oats. 4. Oats. 1. Potatoes. 2. Barley. 3. Oats. 4. Flax.

3. Oats. 1. Potatoes. 2. Barley.

Potatoes they measure by the barrel of 12 cwt. and in each barrel 16 pecks of three quarters each. They plant 10 bushels, of 3 cwt. each, at the average price of 12 s. a barrel, or 1 s. per cwt.

A man, his wife, and four children, will eat a bushel of 3 cwt. every week: in 39 weeks, therefore, they eat 117 cwt. or 5 ton 17 cwt. this is just half an acre for the family. Of oatmeal, the common allowance is a quart of oatmeal a day for a labourer. A mower that is fed is allowed that quantity, and 6 quarts of butter milk a day, or as much bonny clobber. To explain what this is, I must obferve, that they fet the milk three days for the cream to rife, and having then skimmed it, the milk that remains is as thick as blamange, and as four as vinegar, and this is bonny clobber.

'Of barley they fow 6 pecks, each 21 quarts, and the crop ia generally from 20 to 30 fold, or at 25 it is 150 pecks. Of oats they fow a barrel of 24 stone per acre, and they get 6 such barrels. Of flax they fow 40 gallons, and it will fell in common on the foot at 8 l. they find that it enriches the land. No wheat fown but by gentle-men for their own confumption. They burn their corn, inflead of threshing it. The grazing system is generally the succession, buying in at year olds, or if the lands are very bad, two year olds; keep them till four year olds, and then fell them lean at Ballinassoe. They give 10 s. 6 d. to 3 l. 10 s. for yearlings; average 40 s. For two-year olds, they give 3 l. They fell for 6 l. what they gave 2 l. and for those they gave 3 l. they will fell at four-year olds for 6 l. They keep but few sheep, but generally buy year-old wethers; beggerills in May, 8 s. to 10 s. each, shear them and turn to the mountains; bring them on to their arable lands in Winter, shear them again the following year, and send them to the mountain again; and in the following bummer shear again, putting them on their best passures, and selling fat at Ballinassoe, at 15 s. or 16 s. their sleeces 5 lb. at 1 s. a pound. There are some dairies, as far as ten or twelve cows, which are employed for butter. Twenty years ago cows were lett for 1 cwt. of butter for the year, and rearing the calf. Very sew swine kept, and of a bad kind. They plough all with horses, sour in a plough, directed by a man, walking backwards, who, to make them move forward, strikes the beasts in the face. Young colts they harrow with by the tail. Twelve horses are necessary for one handred acres in tillage. They winnow their corn in the road, and let the wind blow away the chaff.

Lord Altamont mentioned descriptive of Mayo husbandry, Acts of Parliament to prevent their pulling the wool off their sheep by

hand; burning their corn; ploughing by the tail, &c.'

In another place, says he, they have three customs which I must begin with; first, They harrow by the tail. Item, The sellow who leads the horses of the plough, walks backwards before them the whole day long, and, in order to make them advance, strikes them in the sace: their heads, I trow, are not apt to turn. Item, They burn the corn in the straw, instead of threshing it.

Poor Mr. Young! what must you have selt in contemplating such management as this! You, who was more delighted in seeing two large compost dunghills turning over and mixing, than if they had been palaces! You, who, when saluted by sour turnep-hoers at Shanes Castle, was more transported than if

you had been received by four Emperors!

It is no wonder that in a country in which the general state of agriculture is so wretched, gentlemen of fortune and enterprize should attempt a reform. Mr. Young has been very careful to note whatever of this kind has fallen within his knowledge. Many are the gentlemen to whom their country is indebted for very great and valuable improvements, both in agriculture and manufactures; and that too upon a scale which, from less respectable authority, might seem incredible. Among these, are Mr. Baron Forster, Lord Shannon, Mr. French, Mr. Jessries, Lord Altamont, Mr. Fitzmaurice, Lord Kingsborough,

We shall conclude this Article for the present with Mr. Young's account of the place and improvements of the last of

these liberal benefactors to their country.

It is not to be expected that so young a man as Lord Kings-borough, just come from the various gaiety of Italy, Paris, and London, should, in so short a space as two years, do much in a region so wild as Mitchelstown; a very short narrative, however, will convisce the Reader, that the time he has spent here, has not been

thrown away. He found his immense property in the hands of that species of tenant which we know so little of in England, but which in Ireland have flourished almost to the destruction of the kingdom, the middle man, whose business and whose industry consists in hiring great tracts of land as cheap as he can, and re-letting them to others as dear as he can, by which means that beautiful gradation of the pyramid, which connects the broad base of the poor people with the great nobleman they support, is broken; he deals only with his own tenant, the multitude is abandoned to the humanity and feelings of others, which to be fure may prompt a just and tender conduct; whether it does or not, let the misery and poverty of the lower classes speak, who are thus affigned over. This was the situation of nine-tenths of his property. Many leases being out, he rejected the trading tenant, and let every man's land to him, who occupied it at the rent he had himself received before. During a year that I was employed in letting his farms, I never omitted any opportunity of confirming him in this fystem, as far as was in my power, from a conviction that he was equally serving himself and the Public in it; he will never quit it without having reason afterwards for regret.

The reflection with which he then introduces Lord K.'s embellishments of Mitchelstown deserves to be particularly re-

marked; it is truely philosophical and just.

In a country changing from licentious barbarity into civilized order, building is an object of perhaps greater consequence than may at first be apparent. In a wild, or but half cultivated tract, with no better edifice than a mud cabbin, what are the objects that can impress a love of order on the mind of man? He must be wild as the roaming herds; savage as his rocky mountains; confusion, disorder, riot, have nothing better than himself to damage or destroy: but when edifices of a different folidity and character arise; when great fums are expended, and numbers employed to rear more expressive monuments of industry and order, it is impossible but new ideas must arise, even in the uncultivated mind; it must feel something, first to respect, and afterwards to love; gradually seeing, that in proportion as the country becomes more decorated and valuable, licentiousness will be less profitable, and more odious. Mitchelstown, till his Lordship made it the place of his residence, was a den of vagabonds, thieves, rioters, and white boys; but I can witness to its being now as orderly and peaceable as any other Irish town, much owing to this circumstance of building, and thereby employing such numbers of the people. Lord Kingsborough, in a short space of time, has raised considerable edifices; a large mansion for himself, beautifully situated on a bold rock, the edge of a declivity, at the bottom of which is a river, and commanding a large tract of country, with as fine a boundary of mountain as I have seen; a quadrangle of offices; a garden of five English acres, surrounded with a wall, hot houses, &c. Besides this, three good stone and slate houses upon three farms, and engaged for three others, more confiderable, which are begun; others repaired, and several cabbins built substantially.

'So naked a country as he found his estate, called for other exertions. To invoke the Dryades, it was necessary to plant; and they must be coy nymphs indeed, if they are not in a few years propitious

to him. He brought a skilful nurseryman from England, and formed twelves acres of nursery. It begins to shew itself. Above ten thousand perch of hedges are made, planted with quick and trees; and several acres, securely inclosed on advantageous spots, and filled with young and thriving plantations. Trees were given, gratis, to the tenantry, and premiums begun for those who plant most, and preserve them best, besides fourscore pounds a year offered for a variety of improvements in agriculture the most wanted upon the estate.

- "Men, who from long possession of landed property, become gradually convinced of the importance of attending to it, may a last work some improvements without meriting any considerable portion of praise; but that a young man, warm from pleasure, should do it, has a much superior claim. Lord Kingsborough has, in this respect, a great deal of merit; and for the sake both of himself and his country, I heartily wish he may seadily persevere in that line of conduct which his understanding has once told him, and must continue to tell him, is so greatly for the advantage of himself, his samily and the Public.
- It is not uncommon, especially in mountainous countries, to and objects that much deserve the attention of travellers intirely negleded by them. There are a few inflances of this upon Lord Kingfborough's estate, in the neighbourhood of Mitchelstown; the first I shall mention, is a cave at Skeheenrinky, on the road between Cahir and that place: the opening to it is a cleft of rock in a lime-stone hill, so narrow as to be difficult to get into it. I descended by a ladder of about twenty steps, and then found myself in a vault of a hundred feet long, and fifty or fixty high: a small hole, on the left, leads from this a winding course of I believe not less than half an Irith mile, exhibiting a variety that struck me much. In some places the cavity in the rock is so large, that when well lighted up by candles (not flambeaux, Lord Kingsborough once shewed it me with them, and we found their smoke troub'esome), it takes the appearance of a vaulted cathedral, supported by massy columns. The walls, cieling, floor, and pillars, are by turns composed of every fantastie form: and often of very beautiful incrustations of spar, some of which glitters so much, that it seems powdered with diamonds, and in others the cieling is formed of that fort which has so near a refemblance to a cauliflower. The spar formed into columns by the dropping of water has taken some very regular forms; but others are different, folded in plaits of light drapery, which hang from their support in a very pleasing manner. The angles of the walls seem fringed with icicles. One very long branch of the cave, which turns to the North, is in some places so narrow and low, that one crawls into it, when it suddenly breaks into large vaulted spaces, in a thou-The spar in all this cave is very brilliant, and almost equal to Bristol stone. For several hundred yards in the larger branch, there is a deep water at the bottom of the declivity to the right, which the common people call the river. A part of the way is over a fort of potter's clay, which moulds into any form, and is of a brown colour: a very different foil from any in the neighbouring country. I have seen the samous cave in the Peak, but think it very

much inferior to this: and Lord Kingsborough, who has viewed the Grot d'Aucel in Burgundy, say, that it is not to be compared with it.

But the commanding region of the Galties deserves more attention. Those who are fond of scenes in which nature reigns in all her wild magnificence, should visit this stupendous chain. It consists of many valt mountains, thrown together in an affemblage of the most interesting seatures, from boldness and height of the declivities, freedom of outline, and variety of parts; filling a space of about fix miles by three or four. Galtymore is the highest point, and rifes like the lord and father of the furrounding progeny. From the top you look down upon a great extent of mountain, which shelves away from him to the South, East, and West; but to the North, the ridge is almost a perpendicular declivity. On that side the famous golden vale of Limerick and Tipperary spreads a rich level to the eye, bounded by the mountains of Clare, King's and Queen's counties, with the course of the Shannon, for many miles below Limerick. To the South you look over alternate ridges of mountains, which rife one beyond another, till in a clear day the eye meets the ocean near The mountains of Waterford and Knockmaldown fill Dungarvon. The Western is the most extensive up the space to the South-rail. view; for nothing stops the eye till Mangerton and Macgilly Cuddy's Reeks point out the spot where Killarney's lake calls for a farther excursion. The prospect extends into eight counties, Corke, Kerry, Waterford, Limerick, Clare, Queen's. Tipperary, King's.

A little to the West of this proud summit, below it in a very extraordinary hollow, is a circular lake of two acres, reported to be musathomable. The descriptions which I have read of the craters of exhausted volcanoes, leave very little doubt of this being one; and the conical regularity of the summit of Galtymore, speaks the same language. East of this respectable hill, to use Sir William Hamilton's language, is a declivity of about one quarter of a mile, and there Galtybeg rifes in a yet more regular cone, and between the two hills is another lake, which from polition seems to have been once the crater which threw up Galtybeg, as the first mentioned was the origin of Galtymore. Beyond the former hill is a third lake, and east of that another hill; I was told of a fourth, with another corre-Sponding mountain. It is only the mere summit of these mountains which rife above the lakes. Speaking of them below, they may be said to be on the tops of the hills; they are all of them at the bottom of an almost regularly circular hollow. On the fide, next the mountain top, are walls of perpendicular rocks, in regular strata, and some of them piled on each other, with an appearance of art rather than nature. In these rocks the eagles, which are seen in numbers on the Galties, have their nells. Supposing the mountains to be of volcanic origin, and these lakes the craters, of which I have not a doubt, they are objects of the greatest curiosity, for there is an unusual regularity in every confiderable summit, having its corresponding crater; but without this circumstance the scenery is interesting in a very great degree. The mountain summits, which are often wrapped in the clouds, at other times exhibit the freest outline; the immehie scooped hollows which fink at your feet, declivities of so

wast a depth as to give one terror to look down; with the unusual forms of the lower region of hills, particularly Bull hill and Round hill, each a mile over, yet rising out of circular vales, with the regularity of semi-globes, unite upon the whole, to exhibit a scenery to the eye, in which the parts are of a magnitude so commanding, a character so interesting, and a variety so striking, that they well deserve to be examined by every curious traveller.

Nor are these immense outlines the whole of what is to be seen in this great range of mountains. Every Glen has its beauties; there is a confiderable mountain river, or rather corrent, in every one of them; but the greatest are the Funcheon, between Sefang and Galtymore; the Limestone river, between Galtymore and Round hill; and the Grouse river, between Coolegarranroe, and Mr. O'Callaghan's mountain; these present to the eye, for a tract of about three miles, every variety that rock, water, and mountain can give, thrown into all the fantastic forms which art may attempt in ornamented grounds, but always fails in. Nothing can exceed the beauty of the water, when not discoloured by rain, its lucid transparency shews, at considerable depths, every pebble no bigger than a pin, every rocky bason alive with trout and eels, that play and dash among the rocks, as if endowed with that native vigour which animate in a superior degree, every inhabitant of the mountains, from the bounding red deer, and the foaring eagle, down even to the fishes of the brook. Every five minutes you have a waterfall in these glens, which in any other region, would slop every traveller to admire it. Sometimes the vale takes a gentler declivity, and presents to the eye, at one stroke, twenty or thirty falls, which render the kenery all alive with the motion; the rocks are toffed about in the wildest confusion, and the torrent bursts'by turns from above, beneath, and under them; while the back ground is always filled up with the mountains which stretch around.

In the western Glen is the finest cascade in all the Galties; there are two falls, with a bason in the rock between, but from some points of view they appear one; the rock over which the water tumbles is about fixty feet high. A good line in which to view these objects is either to take the Killarney and Mallow road, to Mitchelftown, and from thence, by Lord Kingsborough's new one, to Skeheenrinky, there to take one of the Glens, to Galtybeg and Galtymore, and return to Mitchelstown by the Wolf's track, Temple hill, and the Waterfall: or, if the Corke road is travelling, to make Dobbin's inn, at Ballyporeen, the head quarters, and view them from thence.

[To be continued.]

Art. VII. Letters from an English Traveller, Martin Sherlock, Eig. Translated from the French Original printed at Geneva. With Notes. 4to. 3 s. sewed. Cadell, &c. 1780.

7 E have already delivered our opinion of these letters, on their publication in the original French, at Geneva \*;

<sup>•</sup> See our preceding vol. p. 562.

and this our English Readers have now the opportunity of applying to the translation, which appears to be well executed. Our former account has left us very little to add on the present occasion; the letters, as we before hinted, are but scanty morfels, and are proportionally slight and desultory in the descriptions and remarks: though what they want in length seems to be somewhat compensated by a studied sententiousness in the language. If the whole collection, from whence these letters are selected, amount, as we are informed, to two hundred; we apprehend the present number, by a little composition, might have been rendered more satisfactory and amusing than they now appear. But from an advertisement, at the end, we suspect these detached specimens may have been sent out to prepare the way for more elaborate performances of an itinerary nature.

Among the letters that we apprehend might have been enriched from Mr. Sherlock's reserved stores, is the ensuing one dated from Vienna.

There are here a German theatre and an Italian one, both bad. There is only one woman who has merit. Though the has neither beauty nor air, the plays with fuch judgment, and has fuch an expression in her looks, her actions, and her cadence, that she even

interests those who are unacquainted with the language.

You will here see some singular sights; the procession of the knights of the Golden Fleece is superb; the Hungarian guards, who come to court on New-year's day, are the most brilliant troop in Europe; but the most striking sight, and which is really beautiful, is the course of sledges. The Archduches of Milan, the Archduches Mary-Elizabeth, and the Princes Schwarzenberg, were led by the Archduke of Milan, the Archduke Maximilian, and Prince Albert of Saxony: they were sollowed by twenty-five ladies, all in crimson velvet with a very broad gold lace; the dresses of the knights were of a sky-blue velvet, laced like those of the ladies. There were some equipages that cost soop louis. On each side of the horse were two running-sootmen, dressed with an elegance suitable to the equipage.

'This is one of the happy moments in the life of a Viennese lady; it is the moment in which she makes the most pompous display of her riches and of her charms. Embellished with all her graces, her head studded with diamonds, her bosom open, she seems a Venus in her car; and knowing that she is the object of the admiration of some thousands of persons, she shows her heart's content by a perpetual smile. In every country the sair go dressed out to public places to be seen; but here the women make the show, and the pleasure with which this idea inspires them is so lively, that it makes them entirely forget the rigours of the season. It is not so with the poor knight; having no enjoyment, but that of admiring the nape of his fair one's neck, he perishes with cold: in fact, some men have been frequently obliged to retire before the expiration of these two hours,

on account of the severity of the cold; but no woman was ever

known to complain of it.

The course begins in the great square before the Imperial palace; they take several turns there, and after traversing the principal fireets of the city, they return thither to finish it by other turns. The ground of snow, on which this moving picture winds, relieves its splendor extremely, and makes the fight the richest and most dazzling that can be conceived.

But the fight that gives a foreigner the most pleasure at Vienna. is that which he sees in the anti-chamber of Prince Kaunitz, once a week after dinner: it is a concourse of all the indigent who are in need of protection, and who come thither affured of finding it: the ear of that Prince is never thut to the complaints of the poor, and his

hand is always ready to give them affiftance.

If our memory does not missead us, this German diversion on the snow in sledges of various fanciful designs is the subject of one of Hollar's prints: and the engraver is rather more explanatory than the relator.

The following character of Rome and its inhabitants, is

firongly marked.

Rome, October 1, 1778.

'Magnificence, hypocrify, and sadness, reign here; the number of fine palaces, of beautiful churches, of superb sountains, of treafures of art, and venerable remains of antiquity, give an air of gran-

deur to Rome which is not found in any other country.

The want of public entertainments, the little population in proportion to the extent of the city, and its situation, surrounded by hills which prevent a free circulation of air, added to the oppressive weight of the Scirocco wind, seem to me the chief causes of its real sadness; but what increases this apparent gloom, is the air of sanctity which the Romans affect, and the general dress of the country, which is black. The habit of an Abbe is the court dress; and as it is also the cheapest, every one wears it.

Every court is the abode of diffimulation; at Rome there are as many courts as Cardinals; every Cardinal is a kind of Prince, and may become a fovereign; this reason alone may convince you that

this country must have more men in masks than any other.

Of all the fovereigns whom I have feen, the Pope acts majesty the best; the Cardinals are like Martial's epigrams; there are some good, some bad, and many indifferent. Almost all of them derive honour from their rank; the Cardinal de Bernis is an exception; he does honour to the purple by his virtues and his talents.

The women are referred in public, and wanton in private; the

prelates, effeminate; the nobility, illiterate; and the people, wicked.

The studies generally pursued are, the laws, antiquities, and divinity, because these are the three principal roads that here lead to fortune. A poet is confidered as a dangerous, or at least an useless, being, and for this reason a poetical talent is rather oppressed than encouraged. Metallasio could not there find bread.

'You would often have occasion to admire the genius of Corneille for the truth with which he has drawn the Roman women.

<sup>•</sup> Mr. Sherlock thinks this is the Plumbeus Auster of Horace.

The affurance of their eye, the firmness of their step, every turn of their form, and every motion of their body, declare the courage of their souls. They have a very noble look, which is heightened by trailing robes, which they all wear, down to the women of the third

degree.

The nation has something like pride, which does not displease me; it is the haughtiness of a man of an ancient family sallen to decay. But it has a desire of concealing itself, which pleases no one. The first proverb of the country is, He who knows not how to dissemble, knows not how to live; and they all know how to live. They love obscurity in every thing, and though this idea may seem to you trifling, it is not so: Rome is the worst lighted city in Europe; the servants do not carry slambeaux, and the first princes of the country, in other respects extremely luxurious, only carry a small dark lanthorn behind their coaches.

"The Roman has naturally a profound genius and a strongly marked character; he is easily moved, and when he is moved, he is violent to an extreme. If the dress of the country were military, as you walk the streets you would think yourself in ancient Rome; the faces that you meet so much resemble the characters that history has transmitted to us. This idea has often struck me among the men, and it is still more striking in the women. You will often say, "There is a woman who might well be the mother of a Gracchus, and there is another who might produce a Sylla!" The number of Messalinas is small, that of Lucretias less, and of Sempronias you will find some rather at Naples than at Rome.

The following is a mark of national distinction between a Roman and a Neapolitan woman: a woman of Naples is less modest than one of Rome, and more bashful; Neapolitan women have been often seen to blush, but it is not possible to put a Roman woman

out of countenance.'

Having already expatiated so freely on the merits of this Author, in the *foreign* article above referred to, and the Appendix to our last volume, we have left ourselves nothing to add on the present occasion.

S the numerous discoveries of Dr. Priestley have induced us, for some years past, to pay a very particular attention to the subject of Air, the title-page of this performance, of which however two chapters only have yet been published, excited our curiosity in a high degree; as we there found 'Philosophical Inquiries' announced, 'supported by experiments,' and produced 'with a view to shew the probability of air being the first cause of motion in animal life.'—We had long known, as

ART. VIII. Philosophical Inquiries into the Laws of Animal Life. In Six Chapters. By Hugh Smith, M. D. of Hatton Street. With a View to show the Probability of Air being the first Cause of Motion in Animal Life; to point out the mechanical Causes that concur in producing the Circulation of the Blood; and to explain the Laws of Respiration, &c. &c. 4to. Chap. I. and II. 1 s. each. Davis. 1780.

well as our forefathers, in the earliest ages, that air was a necessary ingredient in the compound called life; and that men and animals, for some reason or other, never did, or could long, subsist without it \*. We accordingly expected to find that reason here assigned; and that the Author, availing himself of the lights thrown on the philosophy of the air by modern inquirers, had experimentally discovered some new affections or properties of that fluid, and the particular manner in which it

acts, in supporting the life of animals.

Our curiofity was no less excited by the term, vital air, which, in the contents of the Author's first chapter, is particularly announced as ' the first material cause of motion in animal life.' Though, thanks to Dr. Priestley and Co., our acquaintance with the airs was pretty extensive, we knew not what idea to form of this supposed new branch of the family: and we fully expected that our experimental inquirer would give us a satisfactory definition, or a chemical analysis of this sluid; or at least, give us some assurance that he had caught and exhibited it in an inverted jar; as other air-mongers have always thought themselves bound to do, whenever they have had occasion to introduce a new individual into the tribe of airs.

We have fometimes thought, that by this appellation, the Author intended to design dephlogisticated air, discovered, and thus named, by Dr. Priestley; - but neither do we find in this performance, any criterion by which this vital air is to be distinguished, nor any process described by which it is produced, or may be obtained: nor does the term dephlogisticated air, (either used as a synonym or otherwise) or the name of its inventor, or that of any one of the many excellent philosophers who have cultivated the aërial branch of philosophy, even once occur in the course of this performance. No species of air is there mentioned, except atmospherical air, and this same vital

<sup>\*</sup> That neither sparrows nor men can subsist without air, is well known: but this old truth was never perhaps so pompously declared to the world, as in the following quotation; which will serve as a specimen of the style that our experimental Inquirer has chosen to adopt throughout the greatest part of this treatise.— The little sparrow on the house-top,' says he, ' has a natural common right to the atmospheric air equally with the great lord that inhabits the stately mansion: place this small bird under a receiver, and exhaust the atmospheric air, then vital air will soon lose its spring and power, the blood will cease to circulate, and death follows.—Exclude the external atmosphere, and thereby cut off the common tenure of life from man, and, like the diminutive sparrow, he too must fall to the ground.'

air +; which, though the first cause of animal motion, is sometimes classed by the Author, among the excrementitious sluids that are continually passing off through the skin. But that our readers may have their share of the darkness in which we find ourselves involved, with respect to this sluid, which appears to be common air, and yet seems greatly to differ from it; let them hear the Author speak for himself.

In the course of lectures, delivered the beginning of the year 1778, on the philosophy of physic, which may justly be called the study of nature, this was laid down as the leading aphorism: in all living animals, life, heat, and motion, are infeparable. To prove this point, I began with considering air as matter, and by progressive steps advanced to the thirty-sourth and last principle, which runs thus—VITAL AIR, heat, and motion, appear to be inseparable in animal life. It is therefore meant to be insisted on, that air is the first material cause of

every motion proper to life.'

Vital air is accordingly exhibited as the first material cause of the circulation of the blood, and of the other motions in living animals.—' Its proper standard was fixed,' says our Inquirer, by the Author of Nature, when he first created man; and we hope to shew that standard is regularly and uniformly maintained by means of the atmospheric air.'—' We endeavoured to shew,' says he afterwards, ' that the nerves themselves were primarily indebted to vital air for their power.'—' By the propelling power of vital air, we presume all glandular secretions to be performed, for the purpose of nutrition; and the lymphatic circulations to be supported by the same power: and also, by means of the glands, we presume the laws of generation to be maintained.'

Amidst all this darkness and declamation, a ray of light seemed to dart in upon us, when we saw the Author formally preparing to give us what he calls a definition of his vital air.— It is endowed, says he, with power sufficient to produce a circulating motion in the sluids contained in an animal body. On this basis our desimition is established. Air rarefied, in motion, detained in animal bodies by glandular secretions, or circulating with the sluids in the vascular system, permit us to call VITAL AIR."

Any further quotations on this dark subject, or even a tranfeript of all that the Author has said with respect to the nature

e de la companya de l

<sup>†</sup> The only difference announced between these two airs, that can strike an experimental philosopher, is, that common or atmospheric air is here repeatedly said to be somewhat colder and heavier than vital air: but whether, and in what manner, our Inquirer ascertained their respective temperatures and weights, is not declared.

of this vital air, would not, in our opinion, furnish the reader with the least additional information on the nature of it, or on the manner in which it is manufactured in the bodies of living animals. We never more fully experienced the truth of what a poet has said—that

"True, no meaning puzzles more than wit."

Whether our present puzzle proceeds from the want of discernment in us, or the lack of meaning in the Author, we may safely leave to the decision of his and our readers. To them, likewise, we must refer the expression so frequently occurring throughout this performance, of fatmospheric air being the

means of supporting the flandard of vital air.'

We have framed to ourselves, however, some kind of an idea, or rather something approaching towards one, with respect to the Author's notions of the manner in which he supposes that his vital air puts the animal sluids in motion. It is well known that, in many hydraulic machines, air rarefied by heat gives motion to fluids contained in tubes. The Author instances in the pump, ventilator, fire engine, and pulse-glass.' In like manner, it seems, the colder and heavier external air, entering through the lungs, passes to the heart, and into the vascular system; where, being rarefied by heat, it gives motion to the blood, in some manner or other, not here described.

Without condescending to bestow even an epithet on this reverie, we shall only observe, that our experimental Inquirer is peculiarly unfortunate in pitching on the instrument called the pulse-glass, to illustrate his doctrine, that the blood is kept in motion, in the animal tubes, by means of the propelling force of vital, or any other air .- ' By the pulse-glass,' he says, 'it is clearly proved, that air, rarefied by heat, is capable of giving motion to fluids confined in tubes.'-On the contrary, such is the nature of that instrument, and so far is the fluid contained in it from owing its motion to air; that, in the very act of constructing it, air is necessarily excluded: nor will it exhibit the usual phenomena, if the operator has not been adroit enough so feal it at the time when the air has been expelled from it, by the elaftic vapour of the included liquor; which he has kept in a boiling state for some time, for that very purpose. On turning to our forty-second volume [March, 1770, p. 207, &c.] the Author will find one of Dr. Franklin's conjectures, concerning the immediate cause of the phenomena presented by this instrument, confirmed by us: and having failed in an attempt to account for the motions exhibited in so simple an instrument, consisting only of a glass tube with a little liquor included in it; he may begin to entertain some modest doubts of his powers to ascertain the cause of motion in that complicated E 2 machine, 32 Smith's Philosophical Inquiries into the Laws of Animal Life.

machine, the heart; and may be induced, in future, to present

his notions on this subject

The Author's reasonings are said, in the title-page, to be supported by experiments. We here meet with only one regular set, produced with a view to strengthen his opinion, that air is the first cause of motion in animal life; and that it possibly may supply the place of antagonist muscles, in the heart, and other parts of the animal economy. These notable experiments relate to the motion of the heart only.—Here follows all that the most inquisitive reader need to know concerning these experiments, in number seven.

The heart of an eel or tench, separated from the body, beats a certain number of strokes in a minute. Being put under a receiver, from which the air is afterwards exhausted, its pulsations diminish in number and strength. On admitting the air, the motion of the heart returns, with equal vigor as at first; and on exhausting the receiver, its pulsations are again

diminished, &c.

with a like more precision, a lefo Volemnity

In like manner, were we disposed to misspend our time, in drawing such inferences from such premises, might we conclude that VITAL FIRE is the first cause of motion in animal life; and ascertain the truth of our proposition, by shewing that the pulsations of the heart of an eel or a tench are slackened, and grow weaker, on its being laid upon snow, or plunged in a frigoristic mixture; and become stronger and quicker on its being afterwards dipped into warm water: the absence of vital fire diminishing the moving power in the first case, and its presence restoring it in the second. Instead of appealing to a dead tench, in confirmation of our hypothesis, we might strengthen it with the living and respectable testimony of Dr. Solander, the motions of whose heart and vascular system had once been well nigh irrecoverably stopped, by the gradual slight of his vital fire; while he was herborising with Mr. Banks, on the frozen coasts of Terra del Fuego\*.

We have already said perhaps more than is necessary of this performance: it may be deemed unfair, however, not to acknowledge, that we have not had the advantage of seeing a certain fyllabut to which the Author frequently refers. We ought likewise to add a declaration of his, where he says,—

We wish it, therefore, to be fully understood, it is not any experiment, fingly, nor any number of such experiments, however they may appear to strengthen our opinions, on which we mean to build our new doctrine concerning the circulation of the blood.—To comprehend the full sorce of our arguments,

the

<sup>•</sup> See Hawkesworth's Voyages.

the reader must condescend to examine the chain of principles fet forth in the syllabus, together with the experimental proofs; otherwise he cannot, however learned, enter with us philosophically into this subject.'-How far the obscurities of which we complain may be cleared up by the Author's syllabus, and the experimental proofs to which he here alludes, we can only

conjecture.

Before we take our leave of the Author, we would advise him to lay down, in his four succeeding chapters, the plural character, and the dignified style, which he has thought proper to assume in the two first: unless, indeed, his remaining discoveries and reasonings should, by their importance, justify the solemn and magnificent diction he has employed in this first part of his performance. WE Reviewers, it is true, constantly promulgate our high judgments and opinions in the plural number, and that too very properly—for Nos NUMERUS sumus: and we can plead, besides, the authority derived from long prescription: but we cannot perceive on what grounds the present Author can found his assumption of this style; in a work, especially, where the utmost humility of language would scarce be sufficient to preferve him from censure.

ART. IX. The People's Barrier against Undue Instuence and Corruptien: or, The Commons House of Parliament according to the Conflitution, in which the Objections to an Equal Representation and new Parliaments once in every Year at least are answered, and a digested Plan for the whole is submitted to the Public. By John Cartwright. 8vo. 2 s. 6 d. Almon.

N equal representation, and annual elections, are in this publication, with great boldness of language, and with much strength of argument, maintained to be agreeable to the English constitution, and the most effectual securities against the undue influence of the crown. After recommending these objects to the attention of the aflociators, the Author proceeds to prove, that annual parliaments have the authority of ancient and general custom in this country; that prorogation was a thing not known in the original constitution of parliaments; and that they were affembled at certain fixed times (not to be dispensed with at the pleasure of the crown, at least once ayear, besides being liable to be occasionally summoned by the King for extraordinary business. He next establishes the natural right of the people to a voice in the election of their representatives, and traces the progress of the innovations which have, from time to time, arisen, to infringe the right of perfect representation, and protract the duration of parliaments. After this, he shews, that those acts which introduced first triennial and afterwards septennial parliaments, were sundamen-E 3

Jee p. 3/8.

tal violations of the conflitution, and invalions of the effential rights of Englishmen, and that they have been attended with consequences exceedingly destructive to the interests of this

country.

Having thus prepared the way for his main design, Major Cartwright urges, with great warmth and energy, an immediate reformation in the two great articles which are the subject of his very elaborate work; and offers to the attention of the public a draught of two acts, which, he says, would doubtless reconcile the present jarrings between the crown and the people, terminate every jealousy, and produce a thorough reconciliation, The object of the first bill, which he calls declar ratory, is to annul those acts of parliament which prescribe qualifications both to electors and representatives, and abolish all borough elections. The fecond bill appoints the number of representatives to be elected in each county and great city; and proposes, that the places of election shall be fixed by a grand inquest of the sheriffs and magistrates of the county; that each county shall be divided into as many districts of election as it fends members to parliament, each to elect one, and no note; that the act shall be sufficient authority for electing representatives annually, on one certain day, without issuing writs of election; that the poll be taken in each parish separately, by the parish officers, after public proclamation; that an exact roll be kept in every parish of the competent men; that the report of the parish-officers shall be delivered to the sheriff, and from him to the clerk of the crown, and the names of the elected persons to be published in the Gazette; that every candidate shall declare upon oath, that he neither holds, nor will hold during his continuance in parliament, any place or pension from the crown, that he will in no form whatever bribe the electors, and that he will not vote for or confent to the prolongation of parliament beyond the annual term; that the poll shall be taken by ballot; that not more than five candidates shall be admitted; that where no candidate offers, three perfons shall be nominated by the electors of the district, summoned by the sheriff, and the person returned shall be obliged to ferve, and be intitled to one guinea a-day, and travelling expences, to be paid by the district; that all members shall be intitled to the like falary, in aid of which the fees for private acts shall be paid as usual; and that the parliament thus elected shall meet at certain stated times, without summons, and be liable to be called together, but not diffolved, by the crown. -These, with several other particulars, form the complicated bill which Major Cartwright submits to the public attention. Whether this plan be on the whole a good one, may be questioned; but it is a still more difficult question, how this, or

any

any other scheme of reformation can be carried into execu-

However constitutional the idea of annual parliaments may be, and however partial we are to that scheme, it must be acknowledged, that the execution, in the present times, would probably be attended with inconveniences. There might tit may be objected) be some danger, lest this important trust should fall into the hands of men of low education, and inferior abilities; fince it is not to be expected, that a sufficient number of gentlemen of independent fortunes, and adequate accomplishments, would think a feat in parliament for a fingle fession an object worthy of their attention. If on an annual election there were frequent changes, the nation would perhaps be kept in a state of continual ferment, and the greater part of the House of Commons might be at all times unexperienced in parliamentary business. If changes were not frequent, - if public tranquillity, and a general spirit of inattention to national concerns, should give the same persons a seat in parliament for several successive fessions, they would soon become liable to all that undue in-Auence at present so justly complained of:—and the same objections would perhaps, in some degree, lie against triennial parliaments; with this additional circumstance, that a seat for three years being of more value than for one, contests would be carried on with greater warmth, and probably with more corruption. One of our ablest and most independent senators has faid, That in triennial parliaments the first session would be spent in settling disputes about contested elections, and the third in canvassing; so that only one year in three would remain for the undisturbed transaction of public business. —— These are objections which we have frequently heard suggested; and they certainly merit confideration.

E may apply to this Writer what Anthonio, in the Merchant of Venice, fays of Gratiano,—"He speaks an infinite deal of nothing, more than any man;"—at least more than any man who ever professed, in the sulness of self-consequence, to talk and reason, forsooth, like a philosopher.—A philosopher!—Yes, indeed, this "pert Templar" lays claim to the

ART. X. An Fsfay on Intellectual Liberty, addressed to the Rev. Mr. David Williams, occasioned by his Charges in a Letter to Sir George Saville, Bart. \* submitted to the Consideration of the Legislature, and to all free Inquirers into Philosophical, Political and Moral Truths, particularly among the Dissenters and Papills, respecting an universal Toleration. By M. Dawes, of the Inner Temple, Esq; 8vo. 2s. 6d. Cadell. 1780.

<sup>\*</sup> See Rev. for May 1779, p. 492.

character, with all the freedom of a Bacon or a Locke; and not suspecting the validity of his claim, he appeals to his philosophic character, as a matter absolutely determined by indisputable authority, in order to excuse the very free manner in which he hath thought proper to treat religion. 'You will be sensible (says he to Mr. W.) that I have written my sentiments (if I should be so fortunate as to be clearly understood), as one philosopher writing to another.' PAR NOBILE FRATRUM!

Now, if we clearly understand this philosopher, all his reafonings (such as they are!) amount to these very important and
precious conclusions. First, That he himself also, like some
other wise folks, is just wise enough to be a Deist! and moreover, that 'he feels himself such (to use his own language)
in spite of prejudice; —that 'he is, furthermore, of the opinion of Lord Shastesbury, that the Christian doctrine and protestantism are capable of doing great good or harm.' And what
then? If—(to use an admirable argument in behalf of Providence, against the objections of captious and half-witted infidels,
which Shakespear puts into the mouth of Hamlet) if the sun
breed maggets in a dead dog, is any man so weak, or so ungrateful, as to deny its usefulness, or degrade its influence? We leave
it to the candid and ingenious Reader to extend the argument
farther, and draw from it the conclusion we wish.

But to proceed with this Letter-Writer. He is, with Mr. Williams, an enemy to martyrdom in every sense in which it hath been heretosore extolled by its ardent votaries. He assure us—and we believe him—that 'he will not suffer at the stake for any opinions;' for, according to his system of ethics, it is the chief part of wisdom to consult interest in all its determinations, professions, and pursuits; so that in consequence of this noble and generous maxim, 'a wise man, says he, is a Turk in Turkey, a Jew in Jerusalem, a Mahometan \* in Mecca, a Papist in Portugal, and a Protestant in England; and ALL and any of these as regards his public welfare as a citizen of all or either of these places, or of the world at large.'

This philosopher is angry because all have not the same verfatile and commodious conscience with himself. Mr. Williams, with whatever savourable eye he may regard this Writer's acconomical theology, yet differs from him in some points of polity. Mr. Williams wishes to see the state accommodate itself, universally and without reserve, to the scruples of conscience; he would even extend toleration so far, so very far, as to give full indulgence to principles and declarations that have no

pretentions

Is not a Turk a Mahometan as well as the Arabian? If a Jew polited his interest, more than his conscience, he would not be a fine but a Mahometan, at Jerusalem. Rev.

pretentions to the most distant alliance with conscience. Mr. Dawes, on the contrary (scouting the last idea as absurd and intolerable in every view), opposes what we think persectly just in the former, and wishes to see the scruples of conscience accommodated to the pleasure of the state. Hence his scheme of toleration, founded on the worst part of Hobbism, partakes in its consequences of all the illiberal prejudices of the hierarchy. He hath no religion, and therefore would, for interest's sake, conform to any. The bigot hath no charity for any religion but his own, and therefore would force the consciences of all to submit to one. Thus the insidel-statesman and the bigotted ecclesiastic, though they differ in principle, agree in the conclusion, while the views of each are alike unstriendly to the great interests of truth and freedom.

This performance is, as the Author himself justly consesset, a defultory thing. There is somewhat of an appearance of a first of philosophizing in it; but it is a mere shadow—an unreal mockery of logic, philosophy, and politics. In some places it is unintelligible; in many ambiguous; and in all superficial.

ART. XI. The Messiah. Being the Prophecies concerning him methodized, with their Accomplishments. By Thomas Barker. 8vo. 2 s. 6 d. sewed. White. 1780.

E cannot more properly give our Readers a view of this worthy Author's design and method, than by inferting the following quotation from his Preface:

The prophecies here attempted to be explained are those concerning the Messiah, as proper in this age of infidelity: for if it appears that Jesus was the Messiah, it follows, that what he commands must be obeyed, and consequently the vices of the world avoided. My defign in drawing up this at first, was to confirm myself and family in the true, firm, and rational belief of Christianity; and with a like intention it is now published. And if by methodizing the prophecies in a new manner, by fetting things in a fresh light, or by giving men's minds another call to attend to the subject, any unbelievers shall be convinced, or any who are miliaken about any circumstance be set right, my design will be answered. The method here taken, is to begin with the first general prophecy, that there should be a Saviour; and proceed, by his nature, relation to us, the expectation of him, his offices, qualities, prophecies, sufferings, death, resurrection, exaltation, and the spreading of his gospel, to his final kingdom and judgment. The several texts relating to each particular are fet together in such order as seemed to convey the clearest idea of the subject; and I have then extracted what seems to be the full and clear meaning of what is quoted under each head ; and in the last chapter, I have summed up the substance of what is contained in all the former.'

This little Volume is divided into fifteen chapters, and each of these into several sections. The Author's sentiments on some occasions are not congruous to what may be commonly deemed orthodox or Calvinistical; but the firmness of his faith, the integrity of his heart, and his honest desire to promote the interests of genuine Christianity, are very apparent. We shall only add a few extracts from the Work itself as a specimen.

Chap. II. His nature, and his coming into the world. § 6. What he is in himself, before and above all things.' After presenting a number of texts from the Old and New Testament, Mr. Barker adds the following remarks. 'The Son of God was before all things in glery with God, so as to be himself talled God, superior to all angels. who are to worship him; and the wisdom which Solomon and the son of yrach speak so exaltedly of, seems to be the divine wisdom in the person of the Messah, who was as one brought up with God, and by him when he made the heavens. He was the likeness of the invisible God, the express representation of his person and glory, and like him has the power of upholding all things, and his power is said to be for ever. His being is derived from God, for he is the first born of every creature, the beginning of the creation of God, yet in the before all, and in nature superior to all.'

4 § 7.—The Son and Word of God.' After enumerating the proper

'§ 7.—The Son and Word of God.' After enumerating the proper texts, our Author proceeds. 'The Messiah being the next in nature and dignity to the supreme God, is called the Son of God, his only begotten and beloved Son. And his glory, grace, and truth was above all others; by which he spake as never man spake, did such works as were never seen in Israel, and was tempted, yet without sin. And this testimony God bare to him by a voice from heaven at his baptism and transfiguration; John the Baptist was witness of the one, and the three apostles of the other. His words, by which he taught as one having authority, his works, which were beneficial miracles, and his virtues, by which he went about doing good, convinced his apostles and others that he was indeed the Messiah. He is also called the Word of God, because it was by him God spake and revealed his will to mankind.'

"Chap. XII. § 94. Benefit of his death. A facrifice for fina". The texts being produced as usual, it is added, "From the time of Adam sacrifices had been appointed, as the means of forgiveness of fins, and of reconcilement with God: so under the gospel, God required, before he would pardon sin, a solemn sacrifice, to testify his hatred against it, and warn men of the danger of repeating it; and the offering he appointed was that of the Son of God on the cross, which was the most precious that can be."

" § 97.—Paraon of fin." The texts of scripture are exhibited as usual, and it is then observed, "By this sacrifice once offered, of Jesus Christ, who died for us, is obtained the forgiveness of fins that are past, more generally and effectually than by the sacrifices under the law of Moses, and for those of all ages and all parts of the world. He is the Lamb of God, and by his blood men are cleansed from sin, and encouraged to repentance."

· \$ 97.

5 97. He died for us. Mankind having finned were liable to punishment; and by the rule of the law, " without shedding of blood there is no remission." The Son of God, therefore, gave himself as a sacrifice for men, and laid down his life a ransom for all who would become his disciples. He was cut off, not for his own fins, for he had none, but for our transgressions, that by his temporary sufferings he might deliver man from utter destruction. This was the means God thought fit to appoint for delivering men

from the punishment of their offences.'

The above quotations give a brief view of this Author's manner, and his fentiments on particular points. It would be easy to collect just and sensible remarks on other subjects; but we shall only farther take notice of the 14th Chapter, intitled, "His future kingdom and judgment? A number of scriptures are here, as at other times, collected: Mr. Barker obierves concerning them, 'Towards the end of the world, the kingdom of the Meffiah is to be more fully established in the earth. It is a kingdom exceeding all others in extent, power, excellence, peace, and duration: it is to be the kingdom of the Messiah, for he is the righteous branch of David; the extent of it is over all people, nations, and languages; the power of it is higher than the kings of the earth; its excellence, that he shall execute judgment and justice; its peace, that they shall dwell safely; and its duration, that it shall never be destroyed. In the New Testament it is called, giving Christ the throne of his father David; he is Lord of lords and King of kings; it is a kingdom in this world, and before the general returrection. It is called a reign of a thousand years, whether that be meant to express the real term, or as a general description of an indefinitely long time.'

After other remarks on this part of the subject, it is added. . The kingdoms of this world rise and fall; many great monarchies who have desolated and oppressed, rather than governed the earth, have been destroyed and broken to pieces, and become as though they had never been: but the kingdom of the Messiah is not like them; it is a kingdom of God; when once it is established, it will not be governed by worldly policy, but by the eternal laws of justice; nor supported by the uncertain strength of man, but the power of God; and the event will be accordingly, that it will never be destroyed by any outward power, but continue to the end of the

I have here laid together what the prophets fay of the Messiah's future kingdom; of which, however, as it is not yet come, we should speak with caution. The general fact, That toward the cad of the world the Metfiah shall rule; that all the twelve tribes of Ifrael in their own land will be fubject to him; that all the other nedoms of the world will also obey his laws; that it is a kingdom phreoutness, both in the justice and mercy of the ruler, and the obedience of the governed; that it is a at it will last to the end of the world; ic prophets : but as to the particular cirm, I would not be positive about them.

Many of the descriptions of it in the prophets seem to be highly figurative; and perhaps we cannot always know certainly which are so, and which are literal. The worldsy prosperity and grandeur, the exaltation of Israel, and their superiority to other nations, is chiefly enlarged on in the Old Testament, in compliance with the Jewish desires, and conformity to their law, wherein present prosperity is proposed as their reward. On this the New Testament lays little stress, as appears by the extracts (in the present work) being much larger from the prophets than from the apostles. The New Testament chickly enlarges on the power being in the Messiah, and his communicating a part of it to his disciples; and we find added, that he is to reign over the house of Jacob, the twelve tribes of Israel; that the kingdoms of this world, before the general resurrection, are to become subject to him; and that he will be a good ruler over an obe-dient people.

Such are our Author's reflections on this difficult part of facred writ. Some of our Readers will, no doubt, attend to them with pleasure. However, the whole of this performance has an evident tendency to convince men of the truth of the Christian revelation, and confirm them in the faith and practice which it teaches.

ART. XII. Some Observations on the Origin, Progress, and Method of treating the Atrabilious Temperament and Gout. By William Grant, M. D. 8vo. 1s. 6 d. Cadell. 1779.

E have perused this sensible, lively, practical treatise, with much more satisfaction than all the fine-spun speculative stuff, on the same subject, which the press has of late so abundantly yielded. After giving an anatomical and physiological account of the gradual changes induced in the human body by indolence and high-living, Dr. Grant lays sown the following as a true idea of the gout: ' People living in a thick, heavy air, eating the flesh of stall-sed and diseafed animals, drinking spirituous and sermented liquors, indulging in ease, luxury, and excess, exhausted by heavy mental concerns, and enervated by the debilitating passions of grief, fear, lust, &c. are found liable to such an alteration in the fize, shape, texture, and folidity of their organs, as to render them senfec for the natural functions. Hence a particular relaxation of all the folids; hence a peculiar morbid matter is engendered, producing a fever fui generis, which terminates by a fingular fort of crisis, called a fit of the gout, i. e. a critical deposit on the ligaments of the joints, refembling a true phlegmon in the beginning, but issuing differently, and always returning

The temperament thus formed, he calls the atrabiliary; and the disease being constitutional, he does not doubt that it is also hereditary. Indeed, it is surprising, that any physician can be so biassed by system, as to deny so evident a sact, as the

hereditary transmission of the gout.

Dr. Grant's second chapter treats on 6 the proper means of rearing children, so as to prevent the atrabilious temperament. Here is a curious and instructive parallel between the form and constitution of the country girl and the young lady of sashions much, as may be supposed, to the disadvantage of the latter. We should be tempted to insert this passage, did we not think it better to apprise our fair readers where they may meet with such a picture, than to expose it to the common gaze, by hanging it up in our shop-window. Under this head, the Author candidly retracts an opinion he had once advanced, 6 that every woman qualified to be a mother was also qualified to suckle her own child; being now convinced, that the milk of a healthy wet-nurse, from the labouring class, will lay a better foundation for strength of constitution than that of a lady in fashionable life.

The third chapter contains 'the simple method of curing the atrabilious temperament when recent.' From this, which is interspersed with many useful remarks, and apposite well-told cases, we shall quote the conclusion, which he calls The special Method of Cure abridged.

'He that means to cure the gout radically, and what I call

secundum artem, must strictly observe the following rules:

6 1. He must quit the stat, fertile, cultivated plains, during the summer season, every year, and remove to the highest parts of the country, where the air is thin, pure, and piercing.

• 2. Learn to amuse himself with country diversions, so as to satisfied himself every day. Of these, sisting and wading in the clear stream is the best, walking is next, riding is only a succedaneum, and a carriage is not equal to the intention.

4 3. Avoid populous towns and great cities, shun all occasions of anxiety, debilitating passions, noxious dissipations, exhausting pleasures, and heavy mental concerns, or intense thinking, even on agreeable subjects.

4. Keep to regular hours of exercise, eating, and sleeping; thort sleep is best, on hard beds, in the early part of the night.

5. Let his apartments be large, lofty, ill-finished, and well warmed by strong fires.

6. He will foon feel the advantage of frequent bathing,

much friction, and warm clothing.

of 7. His diet must be in proportion to his exercise, both in quality and quantity; but he must never quite satisfy his hunger at any time. In general, it is proper to abstain from butter, sat, high-seasoned, salted, and smoked meats. Some forbid black sless and pork; but I do not find much difference, so that the sat and skin are taken away. Wild sowl, and game of

all kinds, are proper; and so is fish without butter-sauce. Animal sood must not be used above once in the day; four days in the week he may cat meat, but never mix fish and sless in the same day, far less in the same meal. Butter-milk, whey, fruit, greens, roots, seeds, bread, and dishes prepared from them, ought to constitute the greater part of his nourishment, especially during the summer and harvest. Tea and costee, thin chocolate, and cocoa, agree with most people, mixed with milk, provided they cat no butter along with them.

6 8. The best common drink is cold water; but when he takes animal food, he may drink small beer, cyder, wine, or soirits

very much diluted.

6 9. When he eats heartily at dinner, he ought to eat no supper, but suffer the stomach to be quite empty once in twenty-four hours.

6 10. He must be well rubbed all over every night and morning; and although I wish him to be warmly clothed, yet I think he ought to walk out in the open air as much as may be.

or even cold bathing, will agree with most people, to restore

the strength.

12. But in all fituations he must take care to keep his body regular, by taking sulphur at night when he is costive; and if he should be tormented with wandering pains, the arum-root

and scurvy-grass will be of service to him.'

The propriety of all the rules and precepts here suggested will probably be generally admitted; except perhaps that concerning fishing and paddling in cold water, which is more than ence repeated in this pamphlet, and may be thought to savour too much of Highland origin. To this source likewise may be imputed the Writer's unreasonable prejudice against breeches, which he will not allow to his nurselings till they are twelve years old. A smile may perhaps be excited by the Doctor's description of the stout, healthy rustic, undebauched by luxury and full living, whose "lean lank face, hollow belly, harsh, hairy skin, high cheek-bones, and hard prominent muscles," seem very graphically to depicture the bonny northern swain, when just arrived on a visit to his southern neighbours.

On the whole, we candidly recommend this entertaining and instructive piece to those persons for whose use it is professedly written; and who, if possessed of sufficient firmness and self-command, may receive great benefit from the precepts it incul-

cates.

POLITICAL.

Art. 13. Conflitationalis's Letters to the Electors and People of England, preparatory to the approaching General Election. 8vo. 6d. Almon. 1750.

HIS apparently well meaning writer, with but humble pretentions to authorship, repeats much of what has been said upon the milmanagement of public affairs for some years past. He lays particular thress upon the Butkan plan of tyranny, which he sopposes to have been adopted at the commencement of the present reign; but we believe, he assigns a more certain cause of public calamity, when he speaks of the corruption of Parliament, as arising from the inequality of representation, and the too long continuance of parliamentary authority in the same hands. The remedies, he proposes, do not seem to be of so radical a nature as those which have been suggested by others; and lately, in particular, by an able member of the upper house. He recommends triennial elections, and that the representation of small boroughs be reduced from two members to one. The difference he would have to go in favour of the counties at large. In this particular, his plan is, in our opinion, to be preferred to that of adding an hundred members to the counties, without reducing the number for the boroughs; fince such an addition would augment the House of Commons to 658 members, which is already, perhaps, too numerous an affembly for uleful debate.

In p. 10. he fays, 'From the time of passing that [the triennial] act, which then became a fundamental part of the constitution, no Parliaments could legally be continued for longer than three years; the people, from that time, elected their representatives for three years only, and every parliament that fat for a longer time were self-

elected, and not the true representatives of the people."

And again, p. 12. in speaking of those who passed the septennial law, he says, 'They were not, I am bold to say, any longer the delegates and elected of the people, but became from that period self-elected, and sat and acted under an assumed, illegal, unauthorised power, little better than an usurpation. I am bold to say, they sat by an arbitrary power of their own creating; there was no free affent of the people at large to elect for four years longer; they sat without the consent or authority of the people, and the people were not, as I contend, bound by it. It was a gross violation of a sundamental law, which the makers of that act of innovation had no power or authority to make; and the act was in itself, in my poor opinion, a nullity and an illegal act; and by the very same rule and principle that they enlarged their term of sitting sour years beyond the time for which they were elected by the people, they might, with equal justice, at the end of those sour years, have again enlarged it for their own lives, or for the life of the sovereign.'

We are not, however, with this Author, convinced that a triennial parliament ever ' became a fundamental part of the conflitution, because, we apprehend, that parliament is limited by the constitu-

tion, and not the constitution by parliament. Every argument brought to prove, that the parliament of 1716 could not extend the period of its own existence, equally applies against any parliament. It therefore follows, that those whom this writer calls ' the greatest, the wifest, and most venerable set of patriots, that ever adorned a senate,' and who passed the triennial bill in 1694, ' became from that period felf-elected, and fat and acted under an affumed, illegal, unauthorised power, by which the people, so betrayed, were not bound. It has even been very justly observed of late, that they who passed the triennial bill, were even more criminal than they who introduced the septennial law; because, at the very time, they were mere usurpers of legislative authority, and no parliament: for it is certain that, before that time, the people must needs have elected their representatives for one session only, according to the laws then in being. Those who, in 1691, occupied the House of Commons, had sat there against law, for above three years before they passed that bill, by the arbitrary authority of which they continued themselves in power for three years longer. What they overturned, was indeed a fundamental part of the constitution, and had been fo declared in the written law of the land for more than a The laws of Edward III. confirming those of thousand years. Alfred the Great, so far as to ordain one new parliament at least in every year, were then unrepealed and in full force. It is a mistake in our Author, in representing (p. 15) the triennial bill of 1194, as a 'renewal and new declaration of the ancient law,' and in that refoect. comparing it with the statute of 16 Charles I. That statute respect, comparing it with the statute of 16 Charles I. acknowledged, confirmed, and celebrated the ancient law, as a law of wisdom; and although it fell short of renewing it, by only inforcing the holding one new parliament in three years, whereas the ancient law required three at least, yet different indeed was its complexion from that of the triennial bill of 1694. The direct aim and operation of that fatal act, was to abolift the ancient law, whereby a new election was required for every new fession; and, instead of parliaments of a duration limited by the occasion for which they were called, to give them a continuance, or a lease of the seats of legislation, for a term of years at the discretion of the legislature. Thus the inherent rights of the people were violated, and they were not even consulted upon a measure of such importance.

By giving the same appellation to three several statutes, we seem desirous of consounding them together as laws of the same tendency; whereas they essentially differ from each other. The two sirst trienmial bills of Charles I. and Charles II. materially as they disagreed in some particulars, were alike in this, that they both prevented the crown from dispensing with the laws of Edward III. for more than two years at a time, and inforced the holding of one parliament every third year; whereas the latter, of William and Nary, in order to answer the purposes of the crown and great samilies (for to the people it could answer no good purpose), did violence to the constitution another way still more dangerous, by giving a three years continuance to one and the same parliament. Kings who governed without parliaments, manifested their designs so plainly that they were seen by the people; and when once a parliament was obtained, redress

was looked for, and in the common course of things would naturally follow; but, as preregative, after the Revolution, did not dare to shew any of its ugly seatures, it contrived to lengthen parliaments, in order that its defigns might be compassed by influence. As names are found upon most occasions to impose upon the multitude; so a triemnial parliament, as being the same in found with what the patriots in the reign of Charles 1. had contended for, was artfully introduced.

Thus was a precedent established for parliament to extend its own power, and to circumscribe the liberties of the people at its discretion. The ministry of 1716 saw clearly enough, that if the people might legally be debarred the exercise of their election-privileges for three years at a time, by parity of reason, this disfranchisement might be extended to seven, or indeed to any term whatever which parliament should declare to be expedient.

In p. 28. our Writer introduces a long note against annual parliaments, and calls the proposers of them ' snakes in the grass, who mean to deceive, or are themselves deceived. He then expects of his reader to swallow a very firange paradox,—that annual parliamenta would add to the ftrength of ministers, and the influence of the crown; but the reasons adduced are extremely puerile, and have, in our opinion, been fully refuted by late writer. Among other arguments, it has been remarked with some shrewdness, That if such would have been the consequences, annual parliaments would have been long fince established. If the advocates for triennial parliaments deny this conclusion, they must necessarily acknowledge another, which, perhaps, they will be as little inclined to adopt, viz. That the Crown has no inclination to increase its influence. We should, however, advise those who wish to recommend triennial parliaments, to compare them with Septennial parliaments only; for when put in competition with annual parliaments, either for equity, facility, or found policy, they appear but as drofs in comparison of pure ore.

We have bestowed the more attention on this Article, as a parliamentary reformation seems to be the only event which can avert the impending ruin of our country: and too much pains cannot be taken to conduct it according to the genuine principles of the constitution, without regard to the prejudices or favourite schemes of any party. The well-directed efforts of wise and honest men to that end, will probably succeed far sooner than desponding politicians expect, or sactious ones desire. Truth, justice, and the happiest policy ever known in civil society, when properly held forth to the public, will sooner or later be embraced. Apprehension is awake; inquiry is gone forth; and truth has made no small progress in explaining to us our deviations from constitutional rectitude, and directing us in the right and only road for regaining it.

Art. 14. Three Letters to Lord Viscount Howe. To which are added, Remarks on the Attack at Bunker's Hill. 8vo. 18. Wilkie. 1780.

These Letters, which (if our recollection does not deceive us) originally appeared in the London Chronicle, contain many strong articles of impeachment of the conduct of Lord and Sir William Flowe during their command in America. The particulars are too well Rev. July, 1780.

**C**-2----

known; and the filence of the noble brothers is, by many, confidered as a strong presumption, that the charge implied in them is not

to be answered.

Art. 15. An Address to the Gentlemen, Clergy, and Freeholders of Lancashire, on the Choice of their Representatives at the approaching Election for the County; wherein the Merits and Pretensions of Sir T- Eg-n, Mr. St-y, and Mr. L-r, the several Candidates for this great Trust of Representation, are fully examined and confidered. 8 vo. 1 s. 6 d. Kearsley. 1780.

This election-trumpeter is very affiduous in proclaiming his favourite candidate; at the same time that he bestows no small pains in displaying the faults, both real and imaginary we suppose, of the opposite party. There is no doubt but the trumpeters of Mest. St--y and L-r can be as loud in their praises as this gentleman is in the praises of Sir T. Eg-n. To do him justice, however, he has ablities that might qualify him for a more honourable post.

Plain Truth: or, A Letter to the Author of " Dif-Art. 16. passionate Thoughts on the American War." In which the Principles and Arguments of that Author are refuted, and the Necesfity of carrying on that War clearly demonstrated. By the Author of LETTERS TO A NOBLEMAN on the Conduct of the American War; and of Cool Thoughts on the Consequences of American

Independence. 8vo. 1 s. 6 d. Wilkie. 1780.

Of the Cool Thoughts we gave some account in our Review for January last, p. 88. and the answer to that piece; intitled, Dispasfionate Thoughts, was mentioned in our Number for February, p. 166. In the present tract, the Writer undertakes to refute all the arguments brought by the Dispassionate Thinker in savour of the opimion, that we ought to acquiesce in the American claim of Independence. Our Cool Thinker contends, that the gendeman on the other side of the question, though a sensible writer, is mistaken in all his ideas on this subject; and he candidly supposes, that his mistakes arife wholly from mifrepresentation. Plain Truth, accordingly, endeavours to fet his antagonist right with respect to the policy of giving independence to America. He shews, that Great Britain cannot, considertly with her own safety, yield up North America, while the other powers of Europe shall retain their colonies. He Arongly recommends a spirited prosecution of the war, in which he has not the least doubt of our complete success; and he points out the policy by which America may be perfectly and firmly united with us. This debate is carried on with calmness, decency, and good humour. It gives us real pleasure to see so liberal a spirit pre-vailing in controversy, wherein THE PASSIONS have hitherto taken the lead. It looks as though the present disputants had nothing in view but the laudable elucidation and establishment of those truths and facts in which the honest and dispassionate of both parties are equally interested.

Art. 17. A Letter from the Right Honourable Lord Carysfort to the Huntingdonshire Committee. 8vo. 6d. Almon. 1780. The chief purport of this Letter is, to shew the legality, as well

as necessity, of extending the right of election to the whole body of the people, and of abridging the duration of parliament. Noble Author examines the origin of parliament, the principles on which it was framed, and the causes of the changes which it has undergone; considers the danger which arises to the constitution from the influence of the crown in the election of representatives; and arges the most vigorous exertions, on the part of the people, for the zenovation of the constitution. On these topics he writes with eru-dition, ability, and spirit. The Letter merits the attentive perusal of all who wish to reform or improve the state.

Art. 18. A Short Sketch of the Conduct of Administration towards the Borough of Portsmouth. 4to. 1 s. Kearby, in Stafford

Street. 1780.

Relates to a contested election for mayor of Portsmouth; and complains of the influence of Lord Sandwich and his party, as a

gross instance of the abuse of power.

Art. 19. The Phænomenon; or Northern Comet: Proving that all the Evils and Misfortunes which have befallen this Kingdom, from the Close of the last glorious War to the present ruinous and difgraceful Period, originated in One sole Individual and IDENTICAL PERSON, and tracing the Gradations of his Scheme for introducing Popery into the British Dominions. 8vo. 2s. Richardson.

The general spirit of this publication is sufficiently apparent in its title. Whatever ground there may be for censuring the conduct of individuals, or of administration, it is not to be expected that

virulent abuse will produce reformation.

Art. 20. An Argument on the Nature of Party and Faction, in which is confidered, the Duty of a good and peaceable Citi-

zen at the present Crisis. 8vo. 1s. Dilly. 1780.

This argument turns on the following question, "Is it not a criminal indifference to be of no party in the present alarming and divided state of the nation?" The Writer resolves this question in the affirmative; though we cannot help thinking he evades rather than answers it in telling us, that " there is always a party to be formed for the general good; the party of truth, freedom, virtue. This is a party which it would be criminal indeed not to adopt." It is the undoubted and unalienable privilege of rhetoricians to be indulged in the utmost latitude of expression; and this passage might well pass as a rhetorical flourish of no mean estimation; but when he expressly declares against "inlisting under the standard of any particular fet of men, whether in ministry or in opposition," because men are fallible, and may be improperly interested, and when he confiders this as factions, we are rather surprised, that the ingemious gentleman should imagine he was answering the question in the affirmative, viz. "That it is criminal to be of so party;" especially when he approves of the county affociations on the score of their being " national, not party meetings." However, if the Reader can get over these inconfistencies, he will find in this little tract very liberal and manly sentiments respecting the constitution, and an honourable enthusiasm for the rights of the people; not without some indignation at the principles and practices of the present

ninistry.

We are given to understand from a note the Author has subjoined, that the substance of this argument was spoken in one of those debating societies which were so much in vogue last winter; those grand reservoirs of sound some and finished oratory, which so plentifully watered this metropolis with their resreshing streams. It was natural to expect, that some of them would eversion upon the press, and that a rage for speaking would be converted into a rage for writing. Upon the whole, this is by much the most respectable performance that hath issue from this source.

MISCELLANEOUS.

Art. 21. An Address to the People of England on the Increase of their Poor Raiss. Dedicated to the Earl of Shelburne. By John

Burnby. 8vo. 1 s. Dodsley.

To redress grievances which immediately oppress us, seems not to be the disposition of the present times. The careless method of maintaining our poor; the ill management of the revenue raised for that good end; and the partial mode of affessing it, have been subjects of appeal to those men in authority, whom the constitution has delegated to watch over our concerns, to listen to our complaints, and to remove our distresses. Yet, notwithstanding these grievances have been repeatedly urged, not one of our national guardians has attempted to besten the growing evil. Mr. Burnby, the Author of the pamphlet before us, from seeling the abuses, has renewed the complaint, and addressed his book of Lamentations to the Earl of Shelburne, a nobleman of great understanding, and of an active spirit, who wants nothing but inclination to bring forward an inquiry so important to the relief of the people in general.

Mr. Burnby has exhibited some frightful charges against the wicked policy of certain parish-officers. There is a horrid practice used in too many parishes, to disencember themselves of an idle dissolute semale pauper, by giving 51. or 101. to some worthless object of another parish to marry her; the union of corruption produces a mutual life of infamy, &c.—The servants of a parish seem as wicked as the servants of the Crown! Mr. Burnby knows no dis-

ference!

Our Author mentions another infamous perversion, which ought to be inquired into, and those magistrates who connive at it punished. By the militia-act, "no poor man who has three children born in wedlock, shall be compelled to serve personally, or to provide a substitute." And yet I find, says our Author, 'it is a very common thing for such persons, when drawn for militia-men, to claim this benefit, and immediately afterwards, through the connivance of the deputy lieutenants and justices, suffered to receive a considerable bounty as a substitute, and thereby six his samily upon the oppressed parish!

Every publication directed to a good purpose has its use; and though Mr. Burnby, from not being intimately acquainted with the subject, has not entered largely into the causes of the evil he remondrates against, he has nevertheless contributed his mite sowards the

accomplishing a very defirable end.

A --- .

Art. 22. Some Memoirs of the Life of Dr. Nathan Alcock, lately deceased. 8vo. 1 s. Buckland. 1780.

Dr. Alcock was a physician of confiderable ingenuity and eminence. His life, however, does not feem to have been sufficiently diversified, by remarkable incidents, to make it any way an object of public curiofity. Some indulgence may nevertheless be allowed for the partiality of friendship. Upon this principle, we presume, the Writer of these Memoirs means to rest his apology for commuinicating to the world a narrative which can be very little interesting to those who were not personally acquainted with the subject of

Art. 23. An Historical Account of the Virgin Islands in the West Indies, from their being settled by the English near a Century past, to their obtaining a Legislature of their own in the Year 1773; and the lawless State in which his Majesty's Subjects in those Islands have remained fince that Time to the present. By

George Suckling, Esq. 8vo. 2s. White. 2780.

The Virgin Islands, confisting of upwards of thirty islands and heyr, are fituated in about 18 degrees of north latitude, and 63 of west longitude from London, lying between Saint John de Porto Rico and the Leeward Caribbee Islands, and are possessed by the English and Danes. Sir Francis Drake sailed through them in the year 1580, and, it may be prefumed, in honour of Queen Elizabeth, named them The Virgin Islands. In the first division of those possessed by the English, is Tortols, the principal, formerly inha-bited by the Dutch, who built a strong fort in the bay of that island; but the English expelled them from thence in the year 1666.'

The descriptive part of this performance is very brief; the historical detail is more ample; but the main design of the publication bears reserence immediately to the affairs of the Author. Great inconveniences having been experienced by the inhabitants of these islands, for want of a regular establishment of civil government under conflicutional courts of justice, some endeavours were used, in the year 1773, to remedy the evils complained of; and Mr. Suckling was appointed chief justice. It has been, however, this gentleman's misfortune to suffer a diminution of his interest with the secretary of state for the American department; and much cause of complaint has ensued on the part of this mortified and disappointed officer, who appears to have been injured in his fortune, rather than benefited, by his appointment.-Mean time, from the causes here fet forth, ' his Majesty's orders for establishing constitutional courts of justice in the Virgin Islands have been rendered of no manner of nse or benefit to the people, who are likely to continue in the same lawless state they have been reduced to for several years past, although they still continue to pay the four and a half per cest, duty towards the increase of his Majesty's revenue; and those merchants, by whose means and credit the Planters have been enabled to raise those duties, must give up all hopes of obtaining the means of enforcing payment of their long out-flanding debts, unless from what may happily be effected by a public and lawful inquiry into the rievances and lawless state of his Majesty's subjects in the Virgin Islands,'

F 3

#### Novel.

Art. 24. The Parsonage House. By a young Lady. In 2 Series of Letters. 3 Vols. 12mo. 7 s. 6 d. Macgowan. 1780. This small Novel (for so it must be called, though by the aid of the printer's art it is drawn out into three volumes) contains several distinct narratives, chiefly to shew the hazard of semale credulity, written on the whole in an agreeable manner, and adapted to afford entertainment, without leaving any improper impression.

AGRICULTURE.

Art. 25. Rules and Orders of the Society instituted at Bath, for the Encouragement of Agriculture, Arts, Manufactures, and Commerce, in the Counties of Somerset, Wilts, Glosester, and Dorset, and the City and County of Bristol. To which is added, A List of the Society's Premiums for the Year 1780. 8vo. Cruttwell. 1780. The Rules and Orders of the Bath Society may serve as an excellent model for similar Societies in other parts of the kingdom. The premiums are divided into three classes: the sirk is appropriated to agriculture, planting, the increase of live stock, and industry in servants; the second to manufactures; and the third to arts and mechanics. They are judiciously adapted to the insancy of the society and the present state of the counties for whose benefit they are intended. We are particularly pleased with the following:

To the person who, in the summer of 1780, shall gather and present to the Society the largest quantity of the following grasses in the blade, (when the seed is ripe) or any eight of them, sive

guineas.

Vernal Grass, Fine Bent, Meadow Fox-tail, Common Poa, Great Poa, Annual Poa. Sheep's Fescue, Meadow Fescue, Flote Fescue, Yellow Oat Grass, Crested Dog's tail.

Each species of grass to be kept separate, and sent in the blade; as soon as gathered, to the secretary, who will give specimens of each kind to any person that will undertake to gather them. The quantity gathered of each species to contain not less than four ounces of seed.'

It is much to be regretted, that the several grasses here enumerated have never (that we know of) been cultivated separately. It certainly would be much for the benefit of both pasture and meadow ground, if the herbage could be suited to the soil, and weeds, and grasses of an inferior kind, could be excluded. How many acres of very valuable land have been materially damaged by the admission of rubbish that has come in the hay seeds with which the land has been laid down for grass!

TRADE and MECHANICS.

Art. 26. Thoughts on the Use of Machines in the Cotton Manufacture. Addressed to the Working People in that Manufacture, and to the Poor in general. 8vo. 2 d. or 15 s. per 100 to those who are disposed to give them away. Manchester. 1780.

In our Review for March, we gave an account of a very sensible and ingenious pamphlet "on the utility and policy of employing

machines

machines for shortening labour." The present performance is of a more limited nature, and entirely confined to the cotton manufacture. It contains, however, nearly the same arguments and observations. expressed in a plain perspicuous style, well adapted to the capacities of the poor, to whom it is addressed, and to whom the Author subscribes himself a friend. The whole strain of his reasoning sceme: justly to intitle him to this most honourable appellation; and he has fufficiently proved to the meanest understandings, that the employing of machines to facilitate the production of our cotton manufactures, whatever temporary inconvenience it may occasion to a few individuals, must yet increase the demand for our goods in foreign markets, open new sources of trade and industry, and thereby promote the interest of the poor at large, as well as the general advantage of the community.

Poetical.

Art. 27. Heroic Epifle from Hamet the Moor, Slipper Maker in London, to the Emperor of Morocco, &c. 4to. 2s. Cadell.

It is not every man-it is not every Author, that can happily: convey his meaning to others: Hamet the Moor is of the number of these. There may be meaning—there may be wit, in his poem a but we have not "fense enough to find it out."

Art. 28. Poems on various Subjects. By Eliza Reeves. Dedicated (by Permission) to his Grace the Duke of Manchester.

4to. 10 s. 6 d. fewed. Dilly. 1780. These poems, no doubt, may give much pleasure within the circle of the Authoress's private acquaintance; but to the public, who are unbiassed by personal attachments, they will perhaps appear less interesting.

Art. 29. Eugmio; or, The Man of Sorrow. A Legendary Tale. By a young Gentleman of seventeen. 4to, 18. Wilkie. Erraium. For seventeen read seven.

Ast. 30. An Heroic Epistle to the Rev. Richard Watson, D. D. F. R. S. Archdeacon of Ely, late Professor of Chemistry, now Regius Professor of Divinity, in the University of Cambridge. Enriched with elaborate Notes, and very learned References. 4to. 1 s. 6d. Becket.

This Writer endeavours to make himself, and his readers, merry at the expence of a very worthy and respectable character. - With regard to ourselves, we cannot say that he has succeeded.

Ast. 31. Catiline's Conspiracy: A Mirror of the Times. Part the First. Recommended to the Consideration of the Freeholders

of Great Britain. 4to. 2 s. 6d. Faulder. 1780.

Salluft's elegant profe put into inelegant verse, and adapted to the malevolent purpoles of party. Art. 32. La Belle Affemblee: or, The Female Praters. A Satire.

4to. 1 s. Flexney. 1780.

Illiterate and vulger, written in valiant defiance of grammar and good manners.

Art. 33. The Triumph of Affectation. A Poem. 4to. 19. Bew. 1780. This Writer, in attempting satire, seems to have mistaken his talent. As a verifier, he is tolerably torsed and harmonious; but when F 4

Gott. E.

when folly is to be laughed at, and exposed, he should have recollected that sprightliness and wit are as requisite as correctness and

These indeed are not the only points in which he betrays a desiciency. In the characters he has introduced there is, in general,

nothing peculiarly appropriate or firiking: for inflance;

But, oh! what glittering forms of heroes bold The plains of Essex and of Kent unfold! With air terrific, but in vestments fine, Like blazing stars, they threaten and they shine : The fmart cockade, the hat en militaire, The epaulet, and gorget's fiercer glare; The martial queue that's negligently ty'd, The sword that carelessly adorns the fide; In ilrong mark'd characters at once express

A thirst of glory, and a taste for dress. A young officer may furely have a tafte for dress without incurring the charge of affectation. There is nothing more natural in early life, than the wish to engage attention by personal embellishments.

Art. 34. The Britoniad. A Poem. 4to. 1s, 6d. Kearsley. America, stand forth, to thee I speak-

Exalted nonsense in a Bourbon trap, Led on to rue thy glittering mishap, Thou hadst true friends while argument sedate Pronounced thee kindred to a British State, Pleading thy citizonian rights in vain, While all thy cries feem'd buried in mortmain.

of this exalted nonsense the above will be specimen enough.

Art. 35. An Ode to the Memory of the late Captain James Cooks By W. Fitzgerald, of Gray's Inn. 4to. 1 s. Robinson, &c. This little poem, though far from being a first-rate performance, Is not without its merit. Its merit, however, is of that kind which is derived from the fensibility of a benevolent mind, rather than the vigour of a poetical imagination.

Art, 36. The Maid of Orleans. Translated from the French Kearsly. 1780.

of Voltaire. Canto I. 4to. 1 s. A licentious poem, licentiously translated.

Art. 37. An Epistle to the Right Honourable John Earl of Sandwich; or, The British Hero displayed. A Poem. 4to. 1 s. 6 d. Rivington. 1780.

This Writer, in point of poetical merit, may rank with that long-

forgotten bard of whom Dryden fays,

He faggotted his notions as they fell,

And if they rhym'd, and rattled, all was well.

The poem is a panegyric on Lord Sandwich, and on our naval commanders, &c. &c.

Art. 38, Hobby-Horses, Read [rede] at Bath-Easton, I s. 4to. Dodfley.

These Hobby-horses do not seem calculated to make any great figure upon the Parnassian turf. There does not appear to be the most distant cress of Pegalus in the breed, as they do not frew the

kaft bleed. And though they go fair upon their legs, they have neither speed nor action.

Art. 39. Heroic Epistle from Serjeant Bradsbaw, in the Shades,

to John Dunning, Esq; 4to. 1 s. Wilkie.
The artifice of representing all those who profess themselves advocates for the people, as enemies to Majesty, has been played off by ministerial advocates time immemorial. These disingenuous politicians chuse not to see that, constituted as our government is, no man, who means to bestriend the people, can possibly do otherwise than consult the real interests of the Crown. Stale, however, and futile as this artifice is well known to be, by all the dispassionate part of mankind, it is upon this ground the present writer makes his attack. He endeavours to draw a comparison between the memorable Bradshaw, who presided at the trial of the unfortunate Charles (truly, indeed, unfortunate in bringing on his fate by his own criminal misconduct), and the celebrated Mr. Dunning.

This Writer, though not a mean verifier, is as deficient in argument as in his affertions he is bold and confident. His poverty of argument may be easily guessed at, when, by way of holding up one of the most respectable characters in the kingdom to ridicule, he mentions as a circumftance of infinite reproach, that his grandfather was a footman. How far there may be truth or falsehood in this affertion, is with us, and we should suppose with every one else, a matter of perfect indifference. Our opinion, however, of this Writer's veracity is not so established, that we should, in this case, implicitly rely upon his word. Nothing, furely, can be more foolish or illiberal, than to stigmatise a man for what he has it not in his own power to avoid, and what, at the same time, is not in its own nature disgraceful. That meanness and servility which can prompt a man to make court to power, by descending to the base arts of calumny and detraction, are infinitely more degrading to the dignity of human nature than any defect in the pedigree of his ancestors. There are many, even in elevated stations, whose merits would never Pave intitled them to have been footmen, had they possessed no other recommendation than their integrity.

Art. 40. The Ascension. A Poem. By the Rev. James Atkins, M. A. Fellow of St. Mary Magdalen College, Cambridge. 4to. 6d. Rivington. 1780.

· Prefixed to this Poem, is the following Advertisement:

The following Poem was made as a trial for Mr. Seaton's prize in the University of Cambridge .- But " . There were feveral se reasons, which concurred to determine the judges not to give the pre-4 mium last year to any of the candidates."

What these reasons were, Mr. Atkins seems to have been at a loss to comprehend. And we do not wonder at it. Whoever could write a goem so truly original as the present, must have a mode of thinking (if, peradventure, he can think) peculiar to himself. The critical art has no terms by which this lufus moriae (for it is no regular

production

Extract of a Letter to the Author from Dr. Colman, Vice-chancellor at the time, and one of the judges.

production of folly) can be defined; therefore, gentle Reader, make Lyour own comments upon it:

' The Son I fing returning From earth to heaven, after The vengeance bearing, doom'd to Mankind, till God recall'd him.'

What the Author aimed at in writing this curious piece is best known to himself. He could hardly print it for any other obvious reason, than as a lampoon upon the Fellows of his College, for admitting such a brainless bard into their fociety.

We are truly glad, that the stewards of the Kislingsbury estate have at length given it a fallow. Verinciples of the Virgilian husbandry: We hope it will be upon the

Illa segis demum votis respondet avari Agricolæ, bis quæ solem, bis frigora senset.

The two last words, how applicable to the general mode of cultivation on this unfortunate farm!

Art. 41. The Deferted City. A Poem. 4to. 1 s. 6 d. at No. 3. Chapter Court, St. Paul's.

With what peculiar pathos and sublimity does this bard describe

the downfall of London!

" Where shall we now descry the churches' spire Rifing their varied forms around their fire? Paul's son'rous bell the deaf'ning peal now rings, As warning of the fate which time thus brings. Now th' instant come! bell, steeple see! they fall, Dome, cross, and even the capacions ball Come tumbling down, with a mountain's weight The graves dug, fill'd at once-fo vait the height, Of falling shafts, capitals, and base, With all those effigies of holy race. Paul now is buried in his own church-yard-His ruins for his tomb, see how they're rear'd!

Alas! he is not the Amphion that will rebuild it. Art. 42. The Comforts of Matrimony; or, Love's Last Shift; confisting of Matrimonial Dialogues between People of all Ranks and Degrees, from the Peer to the Peafant. By Ned Ward, jun. 3s. Fielding and Co 1-80.

As this bard has the honesty to avow his poetic lineage, and the modesty to aim at nothing higher than the Moorsields † rank of such bards as hones, merry Ned Ward, we can have no fault to find with his funny Dialogues; which, in point of merit, may fairly vie with the best productions of his predecessor, the author of the pieces' mentioned in the mote.

Art,

<sup>†</sup> Ned, as Cibber informs us, in his Lives of the Poets, kept a public house in Moorfields. ' He was thought to be a man of strong matural parts, and possessed of a very agreeable pleasantry.' His most celebrated productions are his Nuptial Dialogues, and his Leaden but he wrote many other things of the burlefque kind.

Art. 43. The Poetical and Dramatic Works of Oliver Goldsmith, M. B. Now first collected. With an Account of the Life and Writing of the Author. 12mo. 2 Vols. 6s. sewed. Rivington &c. 178c.

Of the pieces here collected, all except the smaller poems have been separately mentioned in our Review, as they first appeared in print. An elegant engraving of Dr. Goldsmith is prefixed; which very much resembles him.

L A w.

Art. 44. The Law and Modern Practice of Ejestiments; with the latest Determinations both in King's Bench and Common Pleas; select Precedents; and three distinct Tables to the whole. By a Gentleman of the Inner Temple. 8vo. 5 s. Brooke.

This Work cannot claim any superiority over those which the public is already in possession of upon the same subject, but on the ground of its containing the later determinations of the courts. In justice to the Author or Compiler, we must say, he has given many cases which are not to be sound in other treatises on the law of ejectments; and in justice to our Readers we must add, that these cases are so loosely cited (most of them being without the names of the parties), that as authorities they cannot be relied on; according to the legal scale of credit, very little attention being due to the anonymous cases of an anonymous writer.

MEDICAL.

Art. 45. A Differtation on the Bark, wherein a new Preparation is recommended to the Public, called Hunt's Tindure. By a Friend of the Proprietor's. 8vo. 6 d. Macgowan. 17-9.

The proprietor here has been lucky enough to light on a friend, who fpeaks as handsomely for him as he could have done for himself.

PAMPHLET relating to the late Riots in LONDON.

Art. 46. The History of the Roman Catholics, &c. With an Account of Lord George Gordon, his Associators, and the Rioters, &c. By a Gentleman of the Law. 8vo. 1s. 6d. Bull.

This gentleman of the law is a miserable scribbler. His pamphlet is so full of Scoticisms, and vulgarisms, that his readers will be at no loss to guess what rank of lawyers the Gentleman belongs to. If you ask a bailist's deputy what is his profession, he will say, 'Sir, I sollow the law.'

RELIGIOUS and CONTROVERSIAL.

Art. 47. A Short Reply to the Kentish Curate's Letter to Archdeacon Law. 8vo. 6 d. Rochester, Fisher; London, Crowder.

The Kentish Curate here meets with the castigation which his unprovoked and wanton attack on a good man, for modestly expressing judicious opinions and liberal sentiments, merited. The Archdeacon's able advocate has so fully resuted the accusations, and exposed the unfairness of his adversary, that he has some reason to

<sup>\*</sup> See Review for April, p. 326.

triumph over him, and to bring against him the heavy charge which concludes his letter:— 'As a man, you have struck at a worthy character in the dark; as a christian, you have violated that charity, without which your religion is nothing; as a protestant, you have pleaded for persecution; and as a clergyman, you have set an example of bitterness and rancour. The transient laugh you may raise, will not compensate for your seelings under such ressections as these. That we give to every bussion. We smile at his mimicries; despise his prostituted talents; and detest his mercenary malignity.'

Art. 48. Resections on the Opposition made by certain Protestants

to an Act lately passed in favour of the Roman Catholics. By a Christian. 8vo. 1s. Payne, at the Mews-gate, &c. 1780.

These restections are just, pious, and candid; they are conceived in the true spirit of Christian and Protestant moderation. The Author tells us, that when the petition against the late Act abovementioned, was brought to him, with an invitation to sign it, he with-held his consent,—at the same time, giving reasons for his resusal. But, says he, as I could do it then only in a cursory and consused manner, I shall now attempt it more distinctly, and more at large; contenting myself, however, with those reasons which I think myself best acquainted with, and which I have now more present to my mind.

As this very feasonable pamphlet is written in a plain and convincing manner, we think it well calculated to produce a good effect, by shewing the narrow-minded zealot, who has either promoted or approved the violent opposition that hath been made to the late act in favour of our fellow-subjects of the Roman Catholic persuasion, how far he has departed from the genuine spirit and temper of that religion which professes to promote on EARTH PEACE—GOOD-WILL TOWARDS MEN, &C.

## ERMON.

Preached at the Ordination held at Chrit's Church, Nov. 21, 1779. by John Lord Bishop of Oxon. Published by his Lordship's Request. By John Randolph, M. A. Student of C. C. 410. 15. Rivington.

This fermon treats of the importance of human learning, and its fubserviency to the study of the Holy Scriptures. The Author obferves, that 'the modern enthusiasts are usually those who have come to the study of sacred learning with minds ill prepared for its reception: and have built their errors upon misinterpretation, or upon that common mistake of arguing from detached passages, separated from the context.' The want of solid learning is also considered by the Author, to be as much the cause of modern insidelity as of modern enshusiasm. 'However,' says he, 'it may plume itself on its superior talents, still it hath its soundation in gross ignorance, and often in an ignorance of plain elementary principles.' All this is very easily said: and in spite of a hundred ordination sermons, silled with common-place remarks on general and worn-out topics of declamation, the world will consider Mr. Gibbon as possessed of more knowledge, and more learning, than ten heads of houses. We are forry for it!

#### CORRESPONDENCE.

To the AUTHORS of the MONTHLY REVIEW.

GENTLEMEN.

As the Leicestershire Memoirs have had neither their requiem fung, or their oblivion publicly announced, by you fage and venerable critics, it gives their Author, Editor, or what you please to call him, some consolation that, amidst the almost general wreck of books consigned to the peaceful shades, by the learned judges of literary merit, his Observations or Hints may live to be serviceable to

fome future topographer.

But to be serious. Being surprised to find an account of the Memoirs of Leicestershire, in your Review for June 1780, three years after their publication; I am solicitous to be informed in what manner you came by a copy, as I purposely withheld them from the Reviewers, for reasons best known to a distinct man. Had I taken the advice of some people, I might, by eagerly aiming at approbation, have seen an early display of your wit at my expence; but as you have spoken with tenderness of the publication, in language unlike what the vain deserve, and often meet with, I feel my situation easy under rather forbidding circumstances.

The professions of candour, which generally accompany your arichares, give me reason to expect that you will condescend to answer my request, in your next Review. If it be only a line in the remotest corner of your work, it will be considered of mighty

import to the Tiney Author of the Leicestershire Memoirs.

Leicester, July 6, 1780.

† We can affure this 'Tiney Author,' as he is pleased to style himself, that we obtained a sight of his 'Leicestershire Memoirs' by beneft means. For a farther explanation, we refer him to the bookseller t, who, in the spring of the present year, advertised the said Memoirs: which being the sirst time, as we apprehend, that the publication was announced in the London News-papers, we deemed ourselves obliged, in coarse, to take some notice of the work; and sorry we are, that we could not say so much in its praise, as the natural partiality of an Author might lead our Correspondent to think was due to its merit.

GENTLEMEN,
July 20, 1780.

I HAD not an opportunity, till within thefe few days, of seeing your Review of April last, but was then much surprised at meeting with a very severe criticism (in page 317.) upon the speech of Leonard Smelt, Esq; published at York; as till that time I had looked upon it as drawn up with remarkable accuracy, particularly if the affertion in the presace might be depended upon, "That it was tare" hen from notes only; but I was still more surprised at sinding the only apparent grounds for this severity proceeded from your high opinion of Mr. S.'s account of some particulars that passed at the meeting. I was present at the meeting at York when the speech was delivered, which has so often called forth the attention of the pub-

lic; and so advantageously situated in the room, that I believe I may

<sup>1</sup> Mr. Lowndes, in Fleet-street.

truly say, I scarce missed hearing a syllable of it; so that I was end abled to take down, with the greatest accuracy, notes of the most firiking passages of the different arguments made use of that day; some sew of which, as delivered by Mr. S. I will send you exactly as they stand on my paper; they may perhaps enable you to judge which publication corresponds most with truth. As it is impossible, for want of space, to send the whole of his arguments, I will send you the notes of such parts only as have been the principal cause of public animadversion; premising, at the same time, that they are such as are of obvious meaning, and which were nowise lowered or qualified in the delivery, nor taken as inferences from the general tenor of his argument. "His (the King's) influence is not exorbitant-his hands ought to be strengthened-instances his inability "to prevent being irreverently spoken of in every company and eveer ry street-not able to prevent being in the public news-papers-" the proceedings of this day introductive of confusion, as they aim at putting the King under the guardianship of parliament, as " they call upon it illegally to interfere with his prerogative, and " inquire into the expenditure of money granted him for his pri-" vate use-want to withdraw the sacred veil that hides from the people the splendors of majesty—Royalty without influence no 66 better than a lifeless skeleton-insists much on the immortality se and impeccability of the King-declares the last is the only safety of the people—defines liberty to be no more than protection and " fecurity—the protection of the King is the liberty of the subject -the Whigs actuated by selfishness-Sir R. Walpole, a leader of that party, of opinion, that every man bad bis price-I fear, alas! "I must subscribe to his opinion—they usurped the gower, but left the name only to the King-made themselves a fourth part of the es constitution-were bold enough to declare the necessity for for doing—have always, till this very time, conducted themselves that a little, illiberal, selfish policy—they are the cause of the " war in America, and fomented the disturbances in Ireland-the " greatest missortune to this country is, that no minister has hitherto been bold enough to keep up the taxes in the time of peace 66 to the highest pitch of a war-establishment, not even Lord Chat-46 ham, who, though he glared a meteor in a storm, had not the es qualifications proper for a minister in times of peace-a violent es opposition to all public measures has strengthened and supported " the rebellion in America—the same opposition have solicited Ire-" land to violence—the calamities of the country do not originate "from the influence of the King, but from his not possessing in-" fluence enough-do not proceed from the influence of the King, " but from the selfishness of the people-I know no man that is free " from the influence of selfishness and party-I do not believe there 46 is at this time a fingle patrio: in Britain—if there is one, he now " fits on the throne-I fear I must say the King is the only patriot 46 this country produces—on what false principle do we call on the es parliament to interfere with the prerogative of the crown-on 46 the false idea, that the King is the servant of the people—it is a mean idea, he is not their servant, but their soul; he is the life, " the foul, the very existence of the constitution."

Till I saw the Review, I had not heard of the publication by Mr. Smelt; but how great was my amazement, on a careful perufal, to find fo much in some parts added, so much lest out in others, and where I discovered something of the original sentiment, it was so much lowered and qualified from the very pointed and decided terms in which it was actually delivered, as scarce to be known again. All those passages in his publication which refer to the subsequent resolutions of the meeting, to the forming a committee, &c. are added; it being impossible that Mr. S. who spoke early in the debates of the day, could refer to them, because it is impossible that a committee to support the petition could be moved for, or resolved upon, till the petition itself had met with the approbation of the meeting. But Mr. S. forgets this, and is guilty of a very unfortunate inaccuracy, by introducing as part of his speech, an account of the haste with which the resolutions were passed; whereas, as I observed before, the refolutions were not noticed till fome hours after he spoke, and when proposed, were neither introduced in haste, nor with an appearance of not being meant to be deliberately confidered; as at least two gentlemen spoke concerning them, and that too for some time, though not for an hour and five minutes each, as Mr. S. did, through all which time he was heard with the most silent attention, fave only in one instance, when he well knows the members of that committee, who, according to his account, speak in thunder, raised their voices, to suppress the indignation of some of his hearers, which was shewn at a time highly improper. - Under the same predicament, likewise, are those two parts of his publication, in which he affores us, that a real great plan of national acconomy will andoubtedly come forward as foon as there is temper and leisure for it; -and that at this time the true principles of trade are beginning to be understood; that the navigation-act in America, and the restraints in Ireland, will be judged as prejudicial to the whole empire, as if they existed in London. I am certain, had these two points made a part of the actual speech, they would have had the greatest weight with an auditory consisting entirely of country-gentlemen and merchants, especially knowing whose authority the speaker had; but unfortunately they never were touched upon.

The same impartiality and regard for truth which compelled me to make these observations on Mr. S.'s publication, induce me likewise to do him justice in saying, that I have always heard he bore an amiable character in every instance of private life; but I must leave you and the world to judge, how far in his public character be is, or is not, the abject tool of despoiss he has been represented by his violent commentators.—As no ill-will to Mr. S. but a real regard for truth, and a wish that the public may not be misled by a publication which appears to me, and all I have conversed with, to be far from accurate, or by an undeserved severity upon the speech published at York, is the sole cause of my troubling you with this, I hope it will find room in the conclusion of your next Review. If you have any doubts of the accuracy of these observations, I will, with the same regard to the intestigation of truth, answer any queries you may choole to put to me, in the most explicit manner I am able.

I am yours,

A YORKSHIREMAN;

Monthly Review for May, which, in his opinion, were defigned to throw a ridicule, or fix a firong mark of censure, on the puritans and old non-conformists. We meant no offence to the liberal Diffenters of the present day: and we think fuch Diffenters will not be offended either at our ridicule or our censure. Slaves to no sect,' we can see the follies and vices of all: and when we see them we

will not fail to expose and chastise them.

Mr. C. notwithstanding his warm attachment to the cause of nonconformity, pretends not to undertake the defence of that spiritual committee which acted under Oliver Cromwell's authority, in the trial of fouls, and were deputed to give in their verdict-grace or no grace! I have nothing to fay with respect to Stephen Marshall, Philip Nye, Joseph Caryl, and Hugh Peters,-excepting, that even the last never appeared more ridiculous during the whole course of his life than Archbishop Laud did, when consecrating the St. Catherine Cree's church: nor could the tyrant Cromwell himself, ever look more odious to the eye of humanity than that same Archbishop did, at the time when fentence was passed upon Dr. Leighton! The farce of confectation at St. Catherine Cree's church (which is a precious subject of ridicule to the Dissenters, and is generally made the most of) exhibited the Archbishop in a light that did little honour to his understanding: and the affair of the Star-Chamber still less credited his heart than the former his head.

Mr. C. entirely mistakes our design, if he imagines that we attempt to depreciate one class of tyrants in order to exalt another:—and we will farther add, that Mr. C. mistakes his own abilities, if he imagines that by attempting to make the bishops appear odious, he can

make the nonconformits appear lovely.

To convince our Correspondent of our impartiality, we will gratify him by publishing his counterpart to what he calls, our 'fevere

censure on the puritanical divines.'

" And we trust also, that not many in these more liberal days, will be found among the members of the Church of England, who can, on ferious conviction, and without a blush, vindicate that farce of mockery to God, and infult and tyranny to man, exhibited by a fet of proud, injelent ecclefiastics, and dark designing politicians, who were deputed by Charles I. to sit in judgment on those ministers of the Church of England, who refused to submit to their illegal impositions, and who infolently assumed to themselves the name of jucceffors of the Apostles. The grand object of their enquiry was, whether ministers submitted to every thing which they on their own authority surv fit to appoint? The names which thone most illustriously in this spiritual committee, were those of Wren, Pearce, Manwaring, and above all Archoistop Land-their very names carrying tyranny with them: for, at that time of day, they were regarded with an abhorrence bordering on deteflation, by all the true lovers of their country, though these mock successors of the Apostles were exalted to the very highest rank among st the great ones of the earth.

### THE

# MONTHLY REVIEW,

For AUGUST, 1780.

# 

ART. I. Biographia Britannica: or, the Lives of the most eminent Persons who have sourished in Great Britain and Ireland, from the earliest Ages to the present Times, collected from the best Authorities, printed and manuscript, and digested in the Manner of Mr. Bayle's Historical and Critical Dictionary. The Second Edition, with Corrections, Enlargements, and the Addition of new Lives. By Andrew Kippis, D.D. F.R.S. and S.A. With the Assistance of the Rev. Joseph Towers, LL.D. and other Gentlemen. Volume the Second. Folio. 11. 113. 6d. Sheets. Bathurst, &c. 1780.

HE particular improvements which the Public is to expect in this edition of the Biographia Britannica, having been already enumerated in our account of the first volume (See Rev. for Oct. 1778), it is at present necessary only to observe, in general, that the Editors appear to prosecute their defign with all the judgment, assiduity, and sidelity, which are requisite to entitle the work to a favourable reception. The new lives in this volume are considerably more numerous, and the additions to the old articles more copious, than in the former. Above a third part of the volume consists of entirely fresh matter.

The additions to many of the lives are exceedingly valuable; and in some inflances are intended to correct the mistakes or partialities which had crept into the original work, and to remove every ground for the charge which has sometimes been brought against it, as consisting of apologies and panegyries rather than impartial narrations; on which account Mr. Walpole said, he could not help calling the work Vindicatio Britannica. The Editors have particularly taken pains to set the characters of the Earl of Arlington and the Earl of Portland in their true light.—We must, however, restrain ourselves from giving any Vol. LXIII.

extracts from these incidental additions to the former articles, in order to make room for some interesting particulars which we shall select from the new lives inserted in this volume.

The following short account of a most ingenious and much lamented youth will be so interesting to those who are engaged in the pursuit of natural knowledge, that we shall make no

apology for laying it before our Readers entire.

fohn Bradby Blake a, a young person who was cut off early in life, but whose improvements in natural knowledge were so great, and his defire to promote it so zealous and successful, that he is justly entitled to an honourable place in this work, was the son of John Blake, Esq; of Parliament-street, Westminster, and was born in Great Marlborough street, London, on the 4th of November, in the year 1745. His grammatical education he received at Wellminster School, then under the care of Dr. Markham, the present Archbishop of York; and Dr. Cooper was his private tutor. In mathematical learning he was instructed by Mr. John Canton of Spittal-square, M. A. a distinguished member of the Royal Society; and he acquired an acquaintance with chemistry from Mr. Read, Mr. More, hereaster mentioned, and the late ingenious Mr. Henry Baker, To render him complete in drawing, he was put under the belt masters; and his progress, in every respect, was equal to the hopes and wishes of his father and his friends. In botany, which was his favourite sludy, he obtained no small degree of skill before he went With all these advantages of education, Mr. Blake struck at once into life, being fent out, in the latter end of the year 1766, when he was something more than twenty-one years of age, as one of the East India Company's Supercargoes at Canton in China. No sooner was he fixed in this place, than he resolved to employ every moment of his time, which could be spared from the immediate duties of his station, to the advancement of natural science, and the benefit of his country. His plan was to procure the seeds of all the vegetables found in China, which are used in medicine, manusactures, or food; or are in any shape serviceable to mankind; and to send into Europe not only such seeds, but the plants by which they were produced. His view in this was, that they might be propagated either in Great Britain and Ireland, or in those colonies of America, the foil and climate of which might best suit them. As these colonies on the Continent, as well as the West-India islands, lie in similar latitudes with the respective provinces of China, &c. Mr. Blake had reason to hope, that the feeds and plants he sent over would all fucceed in one or other of them, if conveyed thither in a vegetable state. Nor did he confine himself solely to the produce of the Chinese Empire. He established, likewise, (by means of the Junks) an intercourse with Japan and Cochin China; and his endeavours were attended with success. The seeds sent by him to John Ellis, Esq; of

<sup>\*</sup> For the materials of this Article, we are indebted to John Blake, Efq; of Parliament-fireet, Westminster, and to the Annual Register for 1776, Vol. xviii. p. 30-35. Part. ii. The authenticity of the account in the Annual Register is confirmed by Mr. Blakes.

Gray's-Inn, of the fine Cochin China rice, which in that country grows on the hills and uplands, have been propagated in Jamaica, by Henry Ellis, Biq; of that island, and on General Melvill's estate in Dominica. The same hath been done by Dr. Garden, of Charles Town, South Carolina who informed his correspondent in London, that the Cochin China rice not only sourished in his own garden, but in those of many gentlemen besides, to whom he distributed some of the seeds which were sent him; and that, by getting into fresh seeds, it promised to be a valuable grain in the hilly parts of that province. The tallow-tree also, the seeds of which Mr. Blake transmitted to England, wath prospered in Carolina, in Jamaica, and in several other of the American colonies. In short, both these articles bid fair to be of much utility to the Colonists; and may, in time, become considerable objects of commerce. All the plants mentioned in the note, with a variety of others from seeds sent by Mr.

<sup>\*</sup> Pecome confiderable objects of commerce.] In the South Carolina and American General Gazette, No. 743, from Monday, Dec. 21, to Monday, Dec. 28, 1772, mention is made of both these articles in the following words. After taking notice of a treatife on the culture of different kinds of rice, entitled, Travels of a Philosopher, by Mons. le Poivre: " We have the pleasure to inform the Public, that, by the indefatigable industry of a very curious gentleman at Canton, a sufficient quantity for experiment of the upland rice from Cochin China, mentioned above, so long wished for, has been seat by the Thames Indiaman, to his friend in Gray s-Inn, who will take proper care that it is distributed to such persons in our southern Colonies as will make a fair trial of this most useful grain. We are further indebted to this curious gentleman for a parcel of the feeds of the croton sehiserum of Linnzus, or the tallow-tree of China, preserved in a most excellent manner. This tree seems to afford a substance between wax and tallow, and which bids fair to be of as great use to our southern American Colonies, as it is in China." Dr. Garden, in a letter to his correspondent, written in the year 1773, acquaints him of his having received from Mr. Blake, sen. seeds of two forts of China indigo, the one of a deep, and the other of a sky blue; the lacquer-tree; the oil-tree, used to mix up the lacquer for cabinets; the alcea, described in Kempser's History of Japan, which in China is an article of vegetable food; and many feeds besides, from Pekin, and the more northerly provinces of China; particularly feveral from Corea, a country between China and Tartary, above three hundred leagues from Canton. The Doctor farther observes. that himself and others were sensible, how highly beneficial such an intercourse between the East Indies and America, as had for its object the propagation of the trees and plants which are uleful either in medicine or commerce, would be to the colonies. His words are these: " When gentlemen of such benevolent dispositions, and public spirit, as Mr. Blake and his father, engage in such attempts, much advantage mult foon flow from a plan of this kind; at leak ought to flow from it, if as well seconded on this side the Atlantic b."

b Annual Register, for 1775, Vol. xvili. Part ii. p. 32.

Blake to England, and distributed with a liberal and impartial hand, are, likewise, in a flourishing state, in his Majesty's garden at Kew; in Chelsea, at the garden of the Apothecaries Company; as also at Dr. Fothergill's, near Stratford; Dr. Pitcairn's, near Islington; Mr. Malcombe's, at Kennington Common; Mr. Bassington's, at Hoxton, and particularly at Mile-end, in the garden of that well-known practical botanist, Mr. Gordon. Moreover, Mr. Gordon took the care of the various plants which Mr. Blake transmitted, in pots, from China, to his father, and to his friend Mr. John Ellis of Gray's-Inn, to whose botanic knowledge and correspondence he was, in some degree, indebted for his own ardour in the same pursuit. Among these plants are the lichees, a very fine fruit of China, of several sorts; as also the gardenia, of a beautiful yellow dye. Not to mention every vegetable production sent over by Mr. Blake, two plants of the teatree, given by him to his father, and Mr. Ellis, were propagated and multiplied by Mr. Gordon, and stood the open air all the Winter of the latter end of 1773, and the beginning of 1774. The last circumstance was owing to the advice of our ingenious young gentleman; who wrote, from Canton, that this valuable shrub was under fnow in some of the northern provinces of China, for many weeks together in the Winter season; on which account he recommended it to be no longer treated in England as entirely a hot-house plant. It would extend this article too much to particularize the various feeds which Mr. Blake, from time to time, took care to get conveyed to England, during his refidence in China; or to enumerate the plants transmitted by him that have flourished in several botanic gardens near London, as also, in some of the most southerly counties in the western parts of the kingdom. There is among them a variety of new species, the seeds of which were put up, by Mr. Blake's own hand, in so peculiar a manner, as to bring with them their vegetative qualities, not only to England, but likewife, for the fecond fea-fon of fowing, to America. His contrivances for this purpose were fingularly ingenious. He also sent home, at various times, above one hundred drawings of choice plants, curiously delineated from nature, with all their parts of fructification, diffected by himself and coloured. These drawings, which are in the possession of his father, have been declared by Dr. Solander to be exquisite performances; and that eminent botanist has classed and arranged some of the plants they represent, according to the Linnzan system, from their parts of fructification: so accurately were these parts described in the drawings. Had Mr. Blake's life been continued, he had intended, in the fame manner, to have gone through all the botanic productions of China. For this purpose, and to facilitate his undertaking, he had engaged to his assistance one of the most ingenious draughtsmen of China, who, under the direction of his able employer, followed nature as closely as pencil and paint could attain. This person, who was retained at no small expence, was in Mr. Blake's apartments in the factory every day, from nine in the morning till fix in the evening, for the three or four years previous to that gentleman's lamented death. During the leisure time afforded by the hipping's being dispatched for Europe, Mr. Blake himself sat at the same table with this and another affiftant, laying out the several vegetable specimens that had

been gathered; dissecting the parts of fructification, with which the Chinese are not acquainted; and drawing the outlines for his assistants to colour and finish. Indeed, they are all so elegantly and scientifically disposed, as to appear to every one who has viewed them,

like the natural plants themselves.

It was not to botanic subjects alone, that Mr. Blake's genius was confined. He had begun to collect fossis and ores, or rather to procure them; for the narrow limits within which the Europeans are, at Canton, confined, could not afford much scope for personal collection \*. Indeed, when they retire to the island of Macao, during the absence of the shipping, they have a range of larger extent. Though this country recess is very desirable, especially in the greatest heat of the weather, Mr. Blake, nevertheless, denied himself the satisfaction of it for one whole year, in order to view the progress of some particular plants through the various seasons. In consequence of his attention to mineralogy, he sent to Mr. Ellis, a specimen of lead ore, from a mine which the Chinese had lately discovered in the interior parts of China. He transmitted likewise, at another time, a specimen of the ore paaktong, or white copper, from the mines in the province of Yunnan, together with zink, or spelter, and other materials; as also the processes by which this beautiful metal is made in China into various utenfils, both for use and ornament. From these materials and processes, his friend Mr. Samuel More c, to whom they were conveyed, has produced a metal equally white and pure, but more ductile, than that which the Chinese themselves make; his specimen having been flatted, in a mill, to the thinnels of common There is, moreover, reason to hope, from the appearances of the Chinese copper ore, that a similar one may be found in the mines of our own country; and that this ore, taken in its proper flate, may, by such processes as are used in China, whiten with zink, and the other materials which are obtainable in England. Blake sent likewise to Mr. More, specimens of the earths, clays, fands, stones, and the rest of the materials employed in making the true Nankin porcelaine; all of which were put by Mr. More into the hands of Mr. Wedgewood, the most celebrated potter in England +. Nay, fo zealous was Mr. Blake that his native country might

<sup>•</sup> Much scope for personal collection.] One can scarcely help reflecting, on this occasion, how mortifying it must have been, to a person of Mr. Blake's active genius, to be precluded, by the policy of China, from exploring, at large, an empire, which presents so many objects of curiofity and observation.'

<sup>+ &#</sup>x27;The most celebrat d potter in England.] This ingenious artist hath produced, from these materials, some pieces of excellent porcelaine; and has declared that the earths, &c. were so complete, and yet so simple a set of specimens, as beyond doubt to be the true porcelaine materials. He defired nothing more than a larger quantity, to distribute it among the different counties of England, that a search

e Secretary to the Society for the encouragement of Arts, Manufactures, and Com- $G_3$ might

might reap the benefit of the ingenuity and invention of the Chinefe, that he was endeavouring to collect models of the machines used in every art practifed, and every manufacture carried on by that industrious people. The specimens of wrought gold, filver, enamel, and ivory; the colours, paintings in glass, insects, and moths, several of them non descript, which he forwarded to his father, are too numerous to be enlarged upon in this place. In fact, he facrificed his life to the industry and ardour of his pursuits. By denying himself the needful recreations, and by fitting too closely to his drawing and studies, he brought on a gravelly complaint; and this was followed by the stone, and a stone fever, which carried him off, at Canton, on the 16th of November, 1773, when he had but just entered the twenty-ninth year of his age. His death was fincerely and deeply lamented, not only by the gentlemen of our Factory, and the other Europeans in Canton, but by the Chinese themselves; who, as we are well informed, held him in the highest esteem. He was buried with much ceremony at Uampo, and the Europeans of all nations united in accompanying his funeral, with every mark they could shew of their concern for so unhappy an event. The principal Chinese merchants also, and others of that nation, testified the same concern, by attending the corpse from the Factory to the water-fide.

' So sensible were Mr. Blake's friends in England of his ingenuity and merit, that they wished to have him enrolled among the members of the Royal Society: accordingly, they had prepared a proper certificate for the purpose, at the very time when his father had but just received the distressing news of his son's decease. This they were ignorant of, when the certificate was presented; and they were filled with grief and surprise, when they were informed by the President, that the object of their kind offices was no more. It was, however, no small consolation to them, that Sir John Pringle seized this occasion of lamenting in the most pathetic terms, the death of Mr. Blake, as a public misfortune. The President insisted on the many marks of attention which this young gentleman had already shewn to the sciences in general, and to natural history in particular; and he declared, that, in the opinion of the best naturalists, there had never been, in that part of the world, where Mr. Blake had spent the last years of his life, a person of more real knowledge. Sir John concluded with observing, that he did not doubt but that every member of the Society would sympathize with him in regretting so great and extensive a loss.

"Mr. Blake's plan was so noble, his head and his heart were so deeply engaged in it, and the pains and expence he went through to carry it into execution were so extraordinary, that his decease may be confidered as an irreparable calamity; unless some other gentleman, who may hereafter reside in China, that great Empire of the Arts,

might be made for the like materials. He wished, too, to be farther favoured, by Mr. Blake, with a description of the nature of the land on which these materials were found in China, or what mines and minerals accompanied them; with plans and sections of the kilns used by the Chinese. All these Mr. Blake would undoubtedly have procured, had he not been prevented by his death.

should have sufficient abilities and courage to tread in his sleps, and to continue what he had thus successfully begun. But, perhaps, it may be a long time before a person be sent into that part of the world, who shall have had an education equally complete, who shall possess the same qualifications, and be animated with as warm a zeal for the advancement of knowledge, and the benefit of his country.'

We shall now introduce to the acquaintance of our Readers, a man who possessed an uncommon genius for mechanical inventions, and employed it in the useful work of planning and

executing navigable canals:

" James Brendley", a man of a most uncommon genius for mechanical inventions, and who particularly excelled in planning and conducting inland navigations, was born at Tunsted, in the parish of Wormhill, and county of Derby, in the year 1716. His parents were possessed of a little freehold, the small income of which his father dissipated by a fondness for thooting and other field-diversions, and by keeping company with people above his rank. The confequence of this was, that his son was so totally neglected, that he did not receive the ordinary rudiments of education. The necessities of the family were so pressing, that young Brindley was obliged, as early as possible, to contribute towards its support; and, till he was nearly seventeen years of age, he was employed in those kinds of light labour which are usually assigned, in country places, to the children of the poor. At this period of his life, he bound himself apprentice to one Bennet, a mill-wright, near Macclesfield, in Cheshire, and soon became expert in the business; besides which, he quickly discovered a strong attachment to the mechanic arts in general, and a genius for extending them much farther than they had hitherto been carried. In the early part of his apprenticeship, he was frequently left by himself, for whole weeks together, to execute works concerning which his master had given him no previous in-Aructions. These works, therefore, he finished in his own way; and Mr. Bennet was often aftonished at the improvements his apprentice, from time to time, introduced into the mill-wright bufiness, and earnestly questioned him from whence he had gained his knowledge. He had not been long at the trade, before the millers, wherever he had been employed, always chose him again, in preserence to the master, or any other workman; and, before the expiration of his servitude, at which time Mr. Bennet, who was advanced in years, grew unable to work, Mr. Brindley, by his ingenuity and application, kept up the bufiness with credit, and supported the old man and his family in a comfortable manner.

It may not be amiss to mention a singular instance of our young mechanic's active and earnest attention to the improvement of mill-work. His master, having been employed to build an engine papermill, which was the first of the kind that had been attempted in those parts, went to see one of them at work, as a model to copy after.

d The materials of this article have been obligingly obtained for us from Mr. Heafhall, Mr. Brindley's brother-in-law, by Mess. Wedgewood and Bentley. To Mr. Bentley we are farther indebted in several respects; and particularly for the short, but masterly seeth of Mr. Brindley's character, at the conclusion.

But, notwithstanding this, when he had begun to build the mill, and prepare the wheels, the people of the neighbourhood were informed by a mill-wright, who happened to travel that road, that Mr. Bennet was throwing his employers money away, and would never be able to complete, to any effectual purpose, the work he had undertaken. Mr. Brindley, hearing of the report, and being sensible that he could not depend upon his master for proper instructions, determined to see, with his own eyes, the mill intended to be copied. Accordingly, without mentioning his design to a single person, he set out, on a Saturday evening, after he had sinished the business of the day; travelled sifty miles on foot; took a view of the mill; returned back, in time for his work, on Monday morning; informed Mr. Bennet wherein he had been descient; and completed the engine, to the entire satisfaction of the proprietors. Besides this, he made a considerable improvement in the pres-paper.

Mr. Brindlev afterwards engaged in the mill-wright bufiness on his own account, and, by many useful inventions and contrivances, advanced it to a higher degree of perfection than it had formerly attained; so that he rendered himself greatly valued in his neighbourhood, as a most ingenious mechanic. By degrees, his fame began to spread itself wider in the country, and his genius was no longer confined to the particular branch in which he had hitherto been employed. In the year 1752, he erected a very extraordinary waterengine at Clifton, in Lancashire, for the purpose of draining some coal-mines, which before were worked at an enormous expence. The water for the use of this engine was brought out of the river Irwell, by a subterraneous tunnel, nearly fix hundred yards in length, carried through a rock; and the wheel was fixed thirty feet below the furface of the ground. Mr. Brindley's superiority to the mechanics in that part of the kingdom where he refided, being now well accertained, and his reputation having reached the metropolis, he was employed by N. Pattison, Esq; of London, and some other gentlemen, in the year 1755, to execute the larger wheels for a new filk-mill, at Congleton, in Cheshire. The execution of the smaller wheels, and of the more complex part of the machinery, was committed to another person, and that person had the superintendency of. the whole. He was not, however, equal to the undertaking; for he was obliged, after various efforts, to confess his inability to complete it. The proprietors, upon this, being greatly alarmed, thought fit to call in the affiftance of Mr. Brindley; but fill left the general management of the construction of the filk-mill to the former engineer, who refused to let him see the whole model, and, by giving him his work to perform in detached pieces, without acquainting him with the result which was wanted, affected to treat him as a common mechanic. Mr. Brindley, who, in the consciousness of genius, felt his own superiority to the man who thus assumed an ascendency over him, would not submit to such unworthy treatment. He told the proprietors, that if they would let him know what was the effect they wished to have produced, and would permit him to perform the business in his own way, he would finish the mill to their fatisfaction. This affurance, joined with the knowledge they had of his ability and integrity, induced them to trust the completion of the

mill folely to his care; and he accomplished that very curious and complex piece of machinery in a manner far superior to the expectations of his employers. They had not folely the pleasure of seeing it established, with a most masterly skill, according to the plan originally proposed, but of having it constructed with the addition of many new and useful improvements. There was one contrivance, in particular, for winding the filk upon the bobbins equally, and not in wreaths; and another for stopping, in an instant, not only the whole of this extensive system throughout its various and numerous apartments, but any part of it individually. He invented, likewise, machines for making all the tooth and pinion wheels of the different engines. These wheels had hitherto been cut by hand, with great labour. But, by means of Mr. Brindley's machines, as much work could be performed in one day as had herecofore required fourteen. The potteries of Staffordshire were also, about this time, indebted to him for several valuable additions in the mills used by them for grinding flint stones, by which that process was greatly facilitated.

In : he year 1756, Mr. Brindley undertook to erect a learn engine, near Newcastle-under-Line, upon a new plan. The boiler of it was made with brick and stone, instead of iron plates; and the water was heated by fire-flews of a peculiar construction; by which contrivances the consumption of fuel, necessary for working a sleam engine, was reduced one half. He introduced, likewise, in this ergine, cylinders of wood, made in the manner of coopers ware, instead of iron ones; the former being not only cheaper, but more easily managed in the shafts; and he substituted wood too for iron in the chains which worked at the end of the beam. His inventive genius displayed itself in various other useful contrivances, which would probably have brought the steam engine to a great degree of persection, if a number of obstacles had not been thrown in his way by some interested engineers, who strenuously opposed any improvements which

they could not call their own.

The disappointment of Mr. Brindley's good designs in this respect must have made the less impression upon him, as his attention was foon after called off to another object, which, in its consequences, hath proved to be of the highest national importance; namely, the projecting and executing of INLAND NAVIGATIONS, from whence the greatest benefits arise to trade and commerce. By these navigations the expence of carriage is lessened; a communication is opened from one part of the kingdom to another, and from each of those parts to the sea; and hence the products and manufactures of the country are afforded at a moderate price. In this period of our great mechanic's life, we shall see the powers given him by the God of Nature, displayed in the production of events, which, in any age less pregnant with admirable works of ingenuity than the present, would have conflicted a national zera. We shall see him triumphing over all the fuggestions of envy or prejudice, though aided by the weight of established customs; and giving full scope to the operations of a frong and comprehensive mind, which was equal to the most arducus undertakings. This he did under the protection of a noble Duke, who had the discernment to fingle him out, and the steadiness and generofity to support him, against the opinions of those who treated

Mr. Brindley's plans as chimeras, and laughed at his patron as an

idle projector.

His Grace the Duke of Bridgwater hath, at Worsley, about Seven miles from Manchester, a large estate, that is rich with mines of coal, which had hitherto lain useless in the bowels of the earth, because the expence of carriage by land was too great to find a mar-ket for consumption. The Duke wishing to work these mines, perceived the necessity of a canal from Worsley to Manchester; upon which occasion, Mr. Brindley, who was now become famous in the country, was consulted. Having surveyed the ground, he declared the scheme to be practicable. In consequence of this, an act was obtained, in the years 17,8 and 1759, for enabling his Grace to cut a canal from Worsley to Salford, near Manchester, and to carry the fame to or near Hollin Ferry, in the county of Lancatter. It being, however, afterwards discovered, that the navigation would be more beneficial, both to the Duke of Bridgwater and the Public, if carried over the river Irwell, near Barton Bridge, to Manchester, his Grace applied again to Parliament, and procured an act, which enabled him to vary the course of his canal agreeably to this new plan, and likewise to extend a side branch to Longford Bridge in Streiford. Mr. Brindley, in the mean time, had begun these great undertakings, being the first of the kind ever attempted, in England, with navigable subterraneous tunnels and elevated aqueducts. The principle laid down at the commencement of this business reslects much honour on the noble undertaker, as well as upon his engineer. It was refolved that the canal should be perfect in its kind, and that, in order to preserve the level of the water, it should be free from the usual obstructions of locks. But, in accomplishing this end, many difficulties occurred, which were deemed unsurmountable. It was necessary that the canal should be carried over rivers, and many large and deep vallies, where it was evident that such stupendous mounds of earth must be raised, as could scarcely, it was thought, be completed by the labour of ages: and, above all, it was not known from what source so large a supply of water could be drawn, as, even upon this improved plan, would be requisite for the navigation. But Mr. Brindley, with a strength of mind peculiar to himself, and being possessed of the confidence of his great patron, who spared no expence to accomplish his favourite defign, conquered all the embarrassments thrown in his way, not only from the nature of the undertaking itself, but by the passions and prejudices of interested individuals: and the admirable machines he contrived, and the methods he took, to facilitate the progress of the work, brought on such a rapid execution of it, that the world began to wonder how it could have been efteemed so difficult. Thus ready are men to find out precences for lessening the merit of others, and for hiding, if possible, from themselves, the unpleasant idea of their own inferiority.

When the canal was completed as far as Barton, where the Irwell is navigable for large vessels, Mr. Brindley proposed to carry it over that river, by an aqueduct of thirty-nine feet above the surface of the water. This, however, being generally considered as a wild and extravagant project, he desired, in order to justify his conduct towards his noble employer, that the opinion of another engineer might

be taken; believing that he could eafily convince an intelligent perfon of the practicability of his defign. A gentleman of eminence was accordingly called in; who, being conducted to the place where it was intended that the aqueduct should be made, ridiculed the attempt; and when the height and dimensions were communicated to him, he exclaimed, "I have often heard of castles in the air, but " never before was shewn where any of them were to be erected." This unfavourable verdict did not deter the Duke of Bridgwater from following the opinion of his own engineer. The aqueduct was immediately begun; and it was carried on with fuch rapidity and saccess, as assonished all those who but a little before condemned it as a chimerical scheme. This work commenced in September, 1760, and the first boat sailed over it on the 17th of July, 1761. From that time, it was not uncommon to fee a boat loaded with forty tons drawn over the aqueduct, with great ease, by one or two mules; while below, against the stream of the Irwell, persons had the pain of beholding ten or twelve men tugging at an equal draught: a striking instance of the superiority of a canal-navigation over that of a river not in the tideway. The works were then extended to Manchefter, at which place the curious machine for landing coals upon the top of the hill, gives a pleasing idea of Mr. Brindley's address in diminishing labour by mechanical contrivances. It may here be obferved, that the bason, in particular, for conveying the supersuous water into the Irwell, below the canal, is an inflance of what an attentive survey of this ingenious man's works will abundantly evince, that, where occasion offered, he well knew how to unite elegance with utility.

The Duke of Bridgwater, perceiving, more and more, the importance of these inland navigations, not only to himself in particular, but to the community in general, extended his ideas to Liverpool; and though he had every difficulty to encounter, that could arise from the novelty of his undertakings, or the fears and prejudices of those whose interests were likely to be affected by them, his Grace happily overcame all opposition, and obtained, in 1762, an act of parliament for branching his canal to the tideway in the Mersey. This part of the canal is carried over the rivers Mersey and Bollan, and over many wide and deep vallies. Over the vallies it is conducted without the affistance of a single lock; the level of the water being preserved by raising a mound of earth, and forming therein a mould, as it may be called, for the water. Across the valley at Streeford, through which the Mersey runs, this kind of work extends nearly a mile. A person might naturally have been led to conclude, that the conveyance of such a mass of earth must have employed all the horses and carriages in the country, and that the completion of it would be the business of an age. But our excellent mechanic made his canal subservient to this part of his design, and brought the foil in boats of a peculiar conttruction, which were conducted into caissoons or cisterns. On opening the bottoms of the boats, the earth was deposited where it was wanted; and thus, in the easiest and simplest manner, the valley was elevated to a proper level for continuing the canal. The ground across the Bollan was raised by temporary locks, which were formed of the timber used in the caisfoons just mentioned. In the execution of every part of the navigation, Mr. Brindley displayed singular skill and ingenuity; and, in order to facilitate his purpose, he produced many valuable machines, which ought never to be forgotten in this kingdom. Neither ought the economy and forecast which are apparent through the whole work to be omitted. His economy and forecast are peculiarly discernible in the stops, or stoodgates, fixed in the canal, where it is above the level of the land. These stops are so constructed, that, should any of the banks give way, and thereby occasion a current, the adjoining gates will rise by that motion only, and prevent any other part of the water from escaping than what is near the breach

between the two gates.

' The success with which the Duke of Bridgwater's undertakings were crowned, encouraged a number of gentlemen and manufacturers. in Staffordshire, to revive the idea of a canal navigation through that county, for the advancement of the landed interest and the benefit of trade, in conveying to market, at a cheaper rate, the products and manufactures of the interior parts of the kingdom. This plan was patronized, and generously supported, by Lord Gower and Mr. Anson; and it met with the concurrence of many persons of rank, fortune, and influence in the neighbouring counties. Mr. Brindley was, therefore, engaged to make a furvey from the Trent to the Mersey; and, upon his reporting that it was practicable to construct a canal, from one of these rivers to the other, and thereby to unite the ports of Liverpool and Hull, a subscription for carrying it into execution was fet on foot in 1765, and an act of Parliament was obtained in the same year. In 1766, this canal, called, by the proprietors, 'The Canal from the Trent to the Mersey,' but more emphatically, by the engineer, THE GRAND TRUNK NAVIGATION, on account of the numerous branches which, he justly supposed, would be extended every way from it, was begun; and, under his direction, it was conducted, with great spirit and success, as long as he lived. Mr. Brindley's life not being continued to the completion of this important and arduous undertaking, he left it to be finished by his brother-in-law, Mr. Henshall; who put the last hand to it, in May 1777, being somewhat less than eleven years after its commencement. We need not fay, that the final execution of the GRAND TRUNK NAVIGATION gave the highest satisfaction to the proprietors, and excited a general joy in a populous country, the inhabitants of which already receive every advantage they could wish from so truly noble an enterprize. This canal is ninety-three miles in length; and, befides a large number of bridges over it, has seventy-six locks, and five tunnels. The most remarkable of the tunnels is the subterraneous passage of Harecastle, being two thousand eight hundred and eighty yards in length, and more than seventy yards below the surface of the The scheme of this inland navigation had employed the earth. thoughts of the ingenious part of the kingdom for upwards of twenty years before; and some surveys, as we have seen, had been made. But Harecastle Hill, through which the tunnel is constructed, could neither be avoided nor overcome by any expedient the ablest engineers could devise. It was Mr. Brindley alone who surmounted this and fuch other difficulties, arising from the variety of measures, firata, and quickquicksands, as no one but himself would have attempted to con-

quer.

 Soon after the navigation from the Trent to the Mersey was undertaken, application was made to Parliament, by the gentlemen of Staffordshire and Worcestershire, for leave to construct a canal from the Grand Trunk, near Haywood in Staffordshire, to the river Severn, near Bewdley. The act being obtained, the defign was executed by our great engineer, and hereby the port of Bristol was added to the two before united ports of Liverpool and Hull. This canal, which is about forty-fix miles in length, was completed in 1772. Mr. Brindley's next undertaking was the survey and execution of a canal from Birmingham, to unite with the Staffordshire and Worcestershire canal near Wolverhampton. This navigation, which was finished in about three years, is twenty-fix miles in length. As, by the means of it, vast quantities of coals are conveyed to the river Severn, as well as to Birmingham, where there must be a peculiar demand for them, extraerdinary advantages have hence accrued to manufactures and commerce. Our engineer advised the proprietors of the last mentioned asvigation, in order to avoid the inconvenience of locks, and to supply the canal more effectually with water, to have a tunnel at Smethwick. This would have rendered it a complete work. But his advice was rejected, and, to supply the desiciency, the managers have lately erected two of Messrs. Watts and Boulton's steam engines. The canal from Droitwich to the river Severn, for the conveyance of falt and coals, was, likewise, executed by Mr. Brindley. By him, also, the Coventry navigation was planned, and it was a short time under his direction. But a dispute arising concerning the mode of execution, he refigned his office; which, it is imagined, the proprietors of that undertaking have fince had cause to lament. Some little time before his death, Mr. Brindley began the Oxfordshire canal. This unites with the Coventry canal, and, if the latter were completed, would be a continuation of the Grand Trunk Navigation to Oxford, and so far towards London. Though the proprietors were too foon deprived of their engineer, for whom they entertained the highest respect, they, nevertheless, contiane the work with great spirit, and give reason to hope that it will be attended with the defired success. The canal from Chesterfield to the river Trent at Stockwith, was the last public undertaking in which Mr. Brindley engaged. He surveyed and planned the whole, and executed some miles of the navigation, which was successfully anished by Mr. Henshall, in 1777. There were sew works of this nature projected, in any part of the kingdom, in which our engineer was not consulted. He was employed, in particular, by the City of Loudon, to survey a course for a canal from Sunning, near Reading in Berkshire, to Monkey Island, near Richmond. But when application was made to Parliament, for leave to effect the defign, the bill met with such a violent opposition from the land-owners, that it was defeated. These gentlemen would not suffer their fine villas to be disturbed by noisy boatmen, or their extensive lawns to be cut through for the accommodation of trade and commerce; though it was from trade and commerce that most of their fine villas and extenfive lawns had derived their origin. Mr.

Mr. Brindley had, for some time, the direction of the Calder navigation; but he declined a farther inspection of it, on account of a difference in opinion among the Commissioners. In the year 1766; he laid out a canal from the river Calder, at Cooper's Bridge, to Huddersfield in Yorkshire, which hath since been carried into execution. In 1768, he revised the plan for the inland navigation from Leeds to Liverpool. He was, likewise, at the first general meeting of the proprietors, after the act of Parliament had been obtained, appointed the engineer for conducting the work: but the multiplicity of his other engagements obliged him to decline this employment. In the same year, he planned a canal from Stockton, by Darlington, to Winston in the Bishopric of Durham. Three plans, of the like kind, were formed by him in 1769; one from Leeds to Selby; another from the Bristol Channel, near Uphill in Somersetthire, to Glastonbury, Taunton, Wellington, Tiverton, and Exeter; and a third from Langport, in the county of Somerset, by way of Ilminster, Chard, and Axminster, to the South Channel, at Axmouth, in the county of Devon. In 1770, he surveyed the country, for a canal from Andover, by way of Stockbridge and Rumsey, to Redbridge near Southampton; and, in 1771, from Salisbury, by Fordingbridge and Ringwood, to Christchurch. He performed the like office, in 1772, for a navigation of the same kind, proposed to be carried on from Preston to Lancaster, and from thence to Kendal, in Westmoreland. He surveyed, likewise, and planned out a canal, to join that of the Duke of Bridgwater's at Runcorn, from Liverpool. If this scheme had been executed, it was Mr. Brindley's intention to have constructed the work, by an aqueduct, over the river Mersey, at a place where the tide flows fourteen seet in height. He also surveyed the county of Chester, for a canal from the Grand Trunk to the city of Chester. The plan for joining the Forth and the Clyde was revised by him; and he proposed some considerable alterations, particularly with regard to the deepening of the Clyde, which have been attended to by the managers. He was consulted upon several improvements with respect to the draining of the low lands, in different parts of Lincolnshire and the Isle of Ely. A canal was likewife laid out by him, for uniting that of Chesterfield, by the way of Derby, with the Grand Trunk at Swarkstone. To the corporation of Liverpool, he gave a plan for cleanfing their docks of mud. This hath been put into execution with the defired effect: and he pointed out, also, the method, which has been attended with equal success, of building walls against the sea without mortar. The last of our great mechanic's ingenious and uncommon contrivances, that we shall mention, is his improvement of the machine for drawing water out of mines, by a losing and gaining bucket. This he afterwards employed, to advatage, in raising up coals from the mines.
When any extraordinary difficulty occurred to Mr. Brindley, in

When any extraordinary difficulty occurred to Mr. Brindley, in the execution of his works, having little or no affistance from books, or the labours of other men, his resources lay within himself. In order, therefore, to be quiet and uninterrupted, whilst he was in search of the necessary expedients, he generally retired to his bed; and he has been known to lie there one, two, or three days, till he

had attained the object in view. He then would get up, and execute his design without any drawing or model. Indeed, it never was his custom to make either, unless he was obliged to do it to satisfy his employers. His memory was so remarkable, that he has often declared that he could remember, and execute, all the parts of the most complex machine, provided he had time, in his survey of it, to fettle, in his mind, the several departments, and their relations to each other. His method of calculating the powers of any machine invented by him, was peculiar to himself. He worked the question for some time in his head, and then put down the results in figures. After this, taking it up again in that stage, he worked it farther in his mind, for a certain time, and fet down the results as before. In the same way he still proceeded; making use of figures only at stated periods of the question. Yet the ultimate result was generally true, though the road he travelled in fearch of it was unknown to all but himself; and, perhaps, it would not have been in his power to have hewn it to another.

The attention which was paid by Mr. Brindley to objects of peculiar magnitude did not permit him to indulge himself in the common diversions of life. Indeed, he had not the least relish for the amusements to which mankind, in general, are so much devoted. He never seemed in his element, if he was not either planning or executing some great work, or conversing with his friends upon subjects of importance. He was once prevailed upon, when in London, to fee a play. Having never been at an entertainment of this kind before, it had a powerful effect upon him, and he complained, for several days afterward, that it had disturbed his ideas, and rendered him unfit for bufiness. He declared, therefore, that he would not go to another play upon any account. It might, however, have contributed to the longer duration of Mr. Brindley's life, and confequently to the farther benefit of the Public, if he could have occafionally relaxed the tone of his mind. His not being able to do fo. might not folely arise from the vigour of his genius, always bent upon capital deligns; but be, in part, the refult of that total want of education, which, while it might add strength to his powers in the particular way in which they were exerted, precluded him, at the same time, from those agreeable reliefs that are administered by miscellaneous reading, and a taste in the polite and elegant arts. The only fault he was observed to fall into, was his suffering himself to be prevailed upon to engage in more concerns than could be completely attended to by any fingle man, how eminent foever might be his abilities and diligence. It is apprehended that, by this means, Mr. Brindley shortened his days, and, in a certain degree, abridged his usefulnels. There is, at least, the utmost reason to believe, that his intense application, in general, to the important undertakings he had in hand, brought on a hectic sever, which continued upon him, with little or no intermission, for some years, and, at length, terminated his life. He died at Turnhurst, in Staffordshire, on the 27th of September, 1772, in the 56th year of his age, and was inated his life. He died at Turnhurst, in Staffordshire, on the buried at New Chapel in the same county. The vast works Mr. Brindley was engaged in at the time of his death, he left to be carried on and completed by his brother-in law, Mr. Henshall, for whom Ьe he had a peculiar regard, and of whose integrity and abilities, in conducting these works, he had the highest opinion.

'Thus was the world deprived, at a comparatively early period,

of this great genius

' Of mother wit, and wife without the schools,'

who very foon gave indications of uncommon talents, and extensive views, in the application of mechanical principles; and who, by a happy concurrence of circumstances, the chief of which was the patronage of his Grace the Duke of Bridgwater, was favoured with an opportunity of unfolding and displaying his wonderful powers. in the execution of works new to this country, and fuch as will extend his fame, and endear his memory, to future times. The Public could only recognize the merit of this extraordinary man in the stupendous undertakings which he carried to persection, and exhibited to general view. But those who had the advantage of conversing with him familiarly, and of knowing him well in his private character, respected him still more for the unisorm and unshaken integrity of his conduct; for his sleady attachment to the interest of the community; for the vast compais of his understanding, which seemed to have a natural affinity with all grand objects, and, likewise, for many noble and beneficent deligns, constantly generating in his mind, and which the multiplicity of his engagements, and the shortness of his life, prevented him from bringing to maturity.

There are, in this volume, many other lives from which we were tempted to make extracts, but from which we are forbidden by our limits; among the articles here alluded to, are the lives of—the late Earl Bathurst—of Dr. Berkeley, Bishop of Cloyne—of that upright senator and distinguished patriot Henry Booth, Earl of Warrington, and of the celebrated John Boyle, Earl of Corke and Orrery. Beside these, the present volume contains the following new lives, viz. Andrew Baxter, Metaphysician; Mary Beale, Painter; George Benson, Divine; Juliana Berners, learned Lady; William Berriman, Divine; Charles Bertheau, Divine; Thomas Birch, Biographer; Sir Richard Blackmore, Physician and Poet; Thomas Blackwell, Critic; William Borlase, Antiquary and Natural Historian; Thomas Bott, Divine; William Bowyer, Printer; Mark Alexander Boyd, Latin Poet; John Boyse, Divine; Samuel Boyse, Poet; James Bradley, Astronomer; Sir Reginald Bray, Statesman; Hugh Broughton, Divine; William Brown, Poet; John Brown, Various Writer; George Buchanan, Historian; Eustace Budgel, Author.

The Editors apprehend the Work will be completed in nine volumes.

ART. II. A Tour in Ireland; with general Observations on the present State of that Kingdom: made in the Years 1776, 1777, and 1778. And brought down to the end of 1779. By Arthur Young, Esq; CONTINUED. See Our last Month's Review.

THEN the wretched state of agriculture, and indeed of every species of rural management, in Ireland, is considered, it is no wonder, that gentlemen of fortune and enterprize are stimulated to exertions much beyond any thing we know of in this island. Indeed, with us, there is no necessity for gentlemen to engage in undertakings of such various compre-hension and magnitude. English farmers have, in general, capitals equal to their farms, and the only encouragement they want, is an advantageous leafe. In Ireland, we observe a melancholy reverse: the tenantry, some of the opulent graziers excepted, are for the most part an oppressed and impoverished race. Their whole attention having been always occupied by their immediate necessities, they are unable to look forward to those reversionary advantages which arise from an improved system of agriculture, and for which they frequently are to forego prefent gratification and emolument. But even supposing their views were more enlarged, and that a spirit of improvement should be awakened in them, yet the want of capital must ever be an impediment to their progress which in most cases will be insur-So true, in more senses than one, is the wise man's mountable. observation, The destruction of the poor is their powerty. How happy then are those who are placed under the patronage of men whose superior fortune and abilities enable them to call forth into action those powers which, without such assistance, they never could have exerted! of men, whose wealth is employed in the distusion of happiness!—We were led more immediately into this reflection by the account which Mr. Young gives of the Lord Chief Baron Forster's truly astonishing improvements:

Took the road to Cullen, where the Lord Chief Baron Forster received me in the most obliging manner, and gave me a variety of information uncommonly valuable. He has made the greatest improvements I have any where met with. The whole country 22 years ago was a waste sheep walk, covered chiefly with heath, with some dwarf surze and fern. The cabbins and people as miserable as can be conceived; not a Protestant in the country, nor a road passable for a carriage. In a word, perfectly resembling other mountainous tracts, and the whole yielding a rent of not more than from 3s. to 4s. an acre. Mr. Forster gould not bear so barren a property, and determined to attempt the improvement of an estate of 5000 acres till then deemed irrecht mable. He encouraged the tenants by every species of persuasion and expense; but they had so ill as opinion of the land, that he was forced to begin with 2 or 3000 Ray. Aug. 1780.

acres in his own hands; he did not, however, turn out the people,

but kept them in to see the effect of his operations.

These were of a magnitude I have never heard before: he had for several years 27 lime kilns burning stone, which was brought four miles with culm from Milford Haven. He had 450 cars employed by these kilns, and paid 700 l. a year for culm: the stone was quarried by from 60 to 80 men regularly at that work; this was doing the business with incomparable spirit—yet had he no peculiar advantages, but many circumstances against him, among which his constant attendance on the courts, which enabled him to see Cullen but by starts, was not the least. The works were necessarily less to others at a time that he could have wished constantly to have attended them.

While this vast business of liming was going forwards, roads were also making, and the whole tract inclosed in fields of about 10 acres each, with ditches 7 seet wide, and 6 deep, at 1 s. a perch, the banks planted with quick and forest trees. Of these sences 70,000

perches were done.

'In order to create a new race of tenants, he fixed upon the most active and industrious labourers, bought them cows, &c. and advanced money to begin with little farms, leaving them to pay it as they could. These men he nursed up in proportion to their industry, and some of them are now good farmers, with 4 or 500 l. each in their pockets. He dictated to them what they should do with their lands, promising to pay the loss, if any should happen, while all the advantage would be their own. They obeyed him implicitly, and he never had a demand for a shilling loss.

'He fixed a colony of French and English Protestants on the land, which have flourished greatly. In Cullen are 50 families of tradefmen, among whom sobriety and industry are perfectly established.

Many of these lands being very wet, draining was a confiderable operation: this he did very effectually, burying in the drains several

millions of loads of stones.

The mode in which the Chief Baron carried on the improvement, was by fallowing. He stubbed the furze, &c. and ploughed it, upon which he spread from 140 to 170 barrels of lime per acre, proportioning the quantity to the mould or clay which the plough turned up. For experiment he tried as far as 300 barrels, and always found that the greater the quantity, the greater the improvement. The lime cost him 9 d. a barrel on the land: his usual quantity 160, at the expence of 6 l. an acre, and the total of that expence alone thirty thousand pounds! After the liming, fallowed the land for rye, and after the rye took two crops of oats. Throughout the improvement, the lime has been so exceedingly beneficial that he attributes his success principally to she use of it. Without it, all other circumstances equal, he has got 3 or 4 barrels an acre of oats, but with it 20 and 22 of barley. Has compared lime and white marle on an improved mountain-soil for slax; that on the lime produced 1000 lb. well scutched, the other 300 lb.

His great object was to shew the tenantry as foon as he could, what these improvements would do in corn, in order to set them to work themselves. He seld them the corn crops on the ground at

40s. an acre: the three crops paid him therefore the expence of the liming, at the same time they were profitable bargains to the tenants. With the third corn-crop the land was said down to grass. Upon this operation, after the manuring, ditching, and draining, the old tenants very readily hired them. Some seeing the benefit of the works, executed them upon their own lands; but their landlord advanced all the money, and trusted to their success and honesty for the payment. This change of their sentiments induced him to build new farm-houses, of which he has erected above 30, all of lime and stone, at the expence of above 401. a house; the farms are in general about 80 acres each.

After fix or seven years, the Chief Baron limed much of it a second time on the sod, and the benefit of it very great. It is all let now on an average at 20 s. an acre. Upon the whole, his Lordship is clearly of opinion that the improvement has been exceedingly profitable to him, besides the pleasure that has attended so uncommon a creation. He would recommend a similar undertaking to others who possess wastes, and if he had such another estate he would undertake it himself.

He also allotted a confiderable tract of many acres for plantations, which are well placed and flourishing. Ridings are cut in them, and they form a very agreeable scenery. Mr. Forster, his son, takes much pleasure in adding to them, and has introduced 1700 sorts of European and American plants. The country is now a sheet of corn: a greater improvement I have not heard of, or one which did more genuine honour to the person that undertook it.

This GREAT IMPROVER, a title more deferving estimation than that of a great general or a great minister, lives now to overlook a country sourishing only from his exertions. He has made a barren wilderness smile with cultivation, planted it with people, and made those people happy. Such are the men to whom monarchs should

decree their honours, and nations erect their statues.'

As a fuitable companion to the above piece, we shall subjoin the picture of Ardmagh, as improved by the present Primate:

Igly 23d, his Grace rode out with me to Ardmagh, and shewed me some of the noble and spirited works by which he has persectly changed the sace of the neighbourhood. The buildings he has erected in seven years, one would suppose without previous information, to be the work of an active life. A list of them will justify this observation.

He has erected a very elegant palace, 90 feet by 60, and 40 high, in which an unadorned simplicity reigns. It is light and pleasing, without the addition of wings or lesser parts, which too frequently wanting a sufficient uniformity with the body of the edifice, are unconnected with it in effect, and divide the attention. Large and ample offices are conveniently placed behind a plantation at a small distance: around the palace is a large lawn, which spreads on every side over the hills, and skirted by young plantations, in one of which is a terrace, which commands a most beautiful view of cultivated hill and dale. The view from the palace is much improved by the barracks, the school, and a new church at a distance, all

which are so placed as to be exceedingly ornamental to the whole

country.

The barracks were erected under his Grace's directions, and form a large and handsome edifice. The school is a building of confiderable extent, and admirably adapted for the purpose: a more convenient or a better contrived one, is no where to be seen. There are apartments for a master, a school room 56 seet by 28, a large dining-room and spacious airy dormitories, with every other necessary, and a spacious play-ground walled in; the whole forming a handsome front: and attention being paid to the residence of the master (the salary is 400 l. a year), the school flourishes, and must prove one of the greatest advantages to the country of any thing that could have been established. This edifice entirely at the Primate's expence. The church is erected of white stone, and having a tall spire, makes a very agreeable object, in a country where churches and spires do not abound—at least such as are worth looking at. Three other churches the Primate has also built, and done considerable reparations to the cathedral.

" He has been the means also of erecting a public infirmary, which

was built by subscription, contributing amply to it himself.

A public library he has erected at his own expense, given a large collection of books, and endowed it. The room is excellently adapted, 45 by 25, and 20 high, with a gallery, and apartments for a librarian.

'He has further ornamented the city with a market house and shambles, and been the direct means, by giving leases upon that condition, of almost new building the whole place. He found it a nest of mud cabbins, and he will leave it a well built city of stone and slate. I heard it asserted in common conversation, that his Grace, in these noble undertakings, had not expended less than 30,000 l. besides what he had been the means of doing, though not directly at his own expence.

When it is considered that all this has been done in the short term of seven or eight years, I should not be accused of exaggeration, if I said they were noble and spirited works undertaken upon a man's paternal estate; how much more then are they worthy of praise, when executed not for his own posserity, but for the public good?

The revenues of the primacy are estimated at 8,000 l. per annum. Thus in public works alone this truly munificent prelate has expended more than half his annual income! It is said that the lands of the primacy, if let as a private estate, would be worth near one hundred thousand pounds a year. If every succeeding Primate were to posses the noble and princely spirit of the present Archbishop, it would be a happy thing for Ireland if the revenues of the primacy were at their extended value.

The reproach of forcing draught horses to pull by the tail, is, we believe, peculiar to Ireland; what will our Readers think of the following custom equally singular, of oxen drawing by the horns; which has lately been introduced into that country by Lord Shannon?

• Lord

Lord Shannon, upon going into tillage, found that the expence of horses was so great, that it eat up all the profit of the farm; which made him determine to use bullocks; he did it in the common method of yokes and bows, but they performed so indifferently, and with such manifest uneafiness, that he imported the French meshod of drawing by the horns; and in order to do this effectually, he wrote to a person at Bourdeaux to hire him a man who was practifed in that method. Upon the correspondent being applied to, he represented difficulties attending it, the man who was spoken to having been in Germany for the same purpose. Upon which Lord Shannon gave directions that every thing should be bought and sent ever which the labourer wished to bring with him. Accordingly, a bullock of the best fort, that had been worked three years, was purchased; also a hay-cart, a plough, harrows, and all the tackle for harnessing them by the horns, which, with the man, were fent over. His falary was to be 400 livres a year, with board, &c. The bullock, 218 livres; tackle for two bullocks, 36. Two carte, 314. A plough and harrow, 123, which, with other expences, came to 45 l. 17 s. and freight 161. 16s. Upon the whole, the experiment cost from first to last, to bring it thoroughly to bear, about an hundred pounds, His Lordship is persuaded, that the first year of his introducing it at large on his farm, saved him the whole. He has pursued the method ever fince, and with the greatest success. He finds the bullocks so perfectly at their ease, that it is a pleasure to see them; for first breaking up lays, and for cross ploughing, he uses four, but in all succeeding earths, only two: nor more for the first ploughing of Aubbles: I saw six ploughs doing this in a wheat stubble, and they did it five or fix inches deep with great case. Upon first introducing it, there was a combination among all his men against the practice, but Lord Shannon was determined to carry his point; in this matter, he followed a course that had all imaginable success: one lively fenfible boy took to the oxen, and worked them readily. His Lordship at once advanced this boy to eight pence a day: this did the business at once; others followed the example, and since that he has had numbers who could manage them, and plough as well as the Frenchman. They plough an acre a day with ease; and carry very great loads of corn and hay, coals, &c. Four bullocks in the French cart brought twelve barrels of coals, ship measure, each 5 cwt. or three tons; but the tackle of the fore couple breaking, the other two drew the load above a mile to a forge. Two of them drew 35 cwt. of flag stone three miles, with ease; but Lord Shannon does not in sommon work them in this manner, three tons he thinks a proper load for four bullocks. Upon the balliff, Mr. Bere, mentioning loads drawn by these oxen, that appeared to me most extraordinarily great, I expressed many doubts; his Lordship immediately ordered the French harvest cart to be loaded half a mile from the reeks ; it was done; 1020 sheafs of wheat were laid on it, and two oxen drew it without difficulty; we then weighed 40 sheafs, the weight 251 lb. at which rate the 1020 came to 6375 lb. or above three tons, which is a vast weight for two oxen to draw; I am very much in doubt whether in yokes they would have flirred the cart so loaded.' If If this account be true, and there can be no reason to dispute it, perhaps the Irish may not be so much mistaken when they insist that a horse 'tired in traces, if put to work by the tail, will draw better, quite fresh again.' The principal objection to either method, viz. that of drawing oxen by the horns, or horses by the tail, seems to be, that it is painful to the animal: with respect to a single exertion, there can be no doubt but in either case they have the power of exerting their full strength, which perhaps may in some degree be impeded by more artificial modes of draught.

Mr. Young's observations are by no means confined merely to agriculture, or rural affairs; his work is occasionally embellished with matter of more general entertainment. The sketches he gives of the common people, who on many accounts are much discriminated from those of the same rank on this side the

channel, are frequently corious and amufing.

Dancing is very general among the poor people, almost universal in every cabbin. Dancing masters of their own rank travel through the country from cabbin to cabbin, with a piper or blind fiddler; and the pay is fix pence a quarter. It is an absolute system of education. Weddings are always celebrated with much dancing; and a Sunday rarely passes without a dance; there are very sew among them who will not, after a hard day's work, gladly walk seven miles to have a dance. John is not so lively, but then a hard day's work with him is certainly a different affair from what it is with Paddy. Other branches of education are likewise much attended to, every child of the poorest family learning to read, write, and cast accounts.

There is a very ancient custom here, for a number of country neighbours among the poor people, to fix upon some young woman that ought, as they think, to be married; they also agree upon a young fellow as a proper husband for her; this determined, they send to the fair one's cabbin to inform her, that on the Sunday following foe is to be borfed, that is, carried on men's backs. She must then provide whisky and cyder for a treat, as all will pay her a visit after mais for a hurling match. As foon as she is borica, the hurling begins, in which the young fellow appointed for her husband, has the eyes of all the company fixed on him; if he comes off conqueror, he is certainly married to the girl; but if another is victorious, he as certainly loses her, for the is the prize of the victor. These trials are not always finished in one Sunday, they take sometimes two or three; and the common expression when they are over is, that such a girl was geal'd. Sometimes one barony hurls against another, but a marriageable girl is always the prize. Hurling is a fort of cricket; but instead of throwing the ball in order to knock down a wicket, the aim is to pass it through a bent slick, the ends sluck in the ground. In these matches they perform such seats of activity, as ought to evidence the food they live on to be far from desicient in pourishment.'

The following passage will, we apprehend, seave upon the mind an impression somewhat similar to that which is felt in

contemplating the remains of a venerable tower, that after having withstood for ages the attacks of hostility and violence, and the depredations of time, at length crumbles infenfibly into ruia.

'At Clonelle, near Castle Res, lives O'Conner, the direct descendant of Roderick O'Conner, who was King of Connaught 6 or 700 years ago; there is a monument of him in Roscommon church, with his scepter, &c. I was told as a certainty, that this family were here long before the coming of the Milesians. The possessions formerly so great are reduced to 3 or 400 l. a year, the family having fared in the revolutions of so many ages, much worse than the O Niels and The common people pay him the greatest respect, and fend him prefents of cattle, &c. upon various occasions. They confider him as the prince of a people involved in one common-ruin.'

The Tartar Chief Macdermot presents a somewhat plea-

santer image.

' Another great family in Connaught is Macdermot, who calls himself Prince of Coolavin; he lives at Coolavin in Sligo, and though he has not above 100 l. a year, will not admit his children to fit down in his presence. This was certainly the case with his father, and some assured me even with the present Chief. Kingsborough, Mr. Ponsonby, Mr. O'Hara, Mr. Sandford, &c. came to see him, and his address was curious: " O Hara! you are wel-" come; Sandford, I am glad to see your mother's son: (his mother was "an O'Brien) as to the rest of ye come in as ye can." Mr. O'Hara of Nymphssield is in possession of a considerable estate in Sligo, which is the remains of great possessions they had in that country: he is one of the few descendants of the Milesian race."

Mr. Young mentions a very fingular circumstance in natural history, which we should be glad to see satisfactorily accounted Perch, fays he, appeared in all the lakes of Ireland, and in the Shannon, at the same time, namely, about seventeen years ago. The naturalists will in all probability find this problem the bow of Ulysses. Mr. Young relates another fact also, which is equally extraordinary: One caution, says he, fpeaking of mules, should be used in relation to their food. If wheat-firaw is cut into chaff and given, it will kill them; the late Bishop of Elphin lost all his mules by it.' We should rather suppose this accident was owing to some other circumstance which was unnoticed at the time.

that almost stagger belief. In one place we read of an acre producing 10 loads of bay; in another, of the same quantity of land producing 16 loads. These, no doubt, are one-horse-car loads. In another place, however, he is more definite, where he speaks of five tons of hay being collected from a fingle acre.

Mr. Young seems to have made it his business to collect very accurate information on the subjects of manufactures and fisheries: we are forry to observe, that the same cause which retards H.4

improvement of agriculture, operates equally with respect like-wise to these.

From this political survey, as it may be called, Ireland appears to possess many important natural advantages, but she is in a great measure prevented from making use of them by want of a sufficient capital. It is to be hoped, however, that free-dom of trade will open new sources of wealth, and not only enable her to enlarge her own capital, but also find employment for the superabundant capital of her more opulent neighbours.

Were we to draw conclusions from such data as this Tour furnishes us with, we might affirm, that Ireland, notwithstanding the encouragement that is held out by the Dublin Society (one of the most respectable in Europe), as well as by the Irish Parliament, can never become eminent for its agriculture, if corn alone is to be the object of cultivation. The natural humidity of the climate, which renders it frequently necessary to kiln-dry their wheat, a process not only expensive, but prejudicial also to the quality of the grain, will for ever be an obstacle that the farmer must have to contend with. In a climate where humidity predominates, and where frost is not severe, nature feems to point out those plants, which are valuable for their leaf, their stem, or their root, as the proper objects of cultivation, in preference to grain, which requires more fun and a Hence we should suppose that tobacco, drier atmosphere. though we do not find our neighbours have yet availed themselves of the late act for permitting its cultivation, is capable of making a very valuable branch of Irish husbandry. Should this plant become a flaple commodity, it would probably be the interest of Ireland to grow no more corn than would come in the course of tillage for turneps and flax: the one being absolutely necessary for the improvement of their sheep and cattle, the other for the supply of their linen manufactures.

[To be concluded in our next.]

C... t

ART. III. A Memorial, most humbly addressed to the Sovereigns of Europe, on the present State of Affairs between the Old and New World 8vo. 2 s. 6 d. Almon. 1780.

HE Editor of this Memorial informs the Public, that it was written by a gentleman, lately deceased, who, from fome misfortune in his personal relations, left England, and took up his residence in the Azores, or Western Isles;—that he had not been unpractised in government, or uninformed by experience concerning the nature of the European settlements in America;—and that this Memorial was the last result of his resections. Whoever was the author, or with whatever circumstances

flances it is ushered into the world, the work appears to merit a more than common share of attention.

Taking it for granted, that North America is de facto an Independent Power\*, which has taken its equal station with other powers, the Memorialist examines into the precise nature of this change in the political state of the world, and enquires what are likely to be the consequences of this change, and with what spirit, and by what conduct, the advancing state of things should be met. In comparing the amplitude and growth of the Old and the New World, he remarks, that in order to produce natural greatness, besides extent of territory, there must be a natural capability of systematic connection. America has this advantage, being naturally divided into two extensive syftems, the Northern and Southern; the former possessed by the English, the latter principally by the Spanish and Portuguese. There is no where in Europe such greatness of interwoven and combined interests, as that of North America. The nature of the coast, and of the winds on that coast, renders navigation, through the whole extent, easy: it has the advantage of large internal waters; and its foil produces every thing that nature requires, luxury covets, or power can use. The continent of South America has still greater amplitude of basis, a greater variety of climates, and, as to its flate of supplies, is further advanced towards a natural independence than the powers of Europe are aware. They have every variety of supply, and a free communication by a regular marine. In the elevated parts of the country, agriculture is in a state to afford plenty for home consumption, and a surplus for exportation. The West side of South America, possessed by one nation, will rise into an object of greater magnitude, in activity, wealth and power, than that in North America, as it is greater in the variety and extent of its internal communication; besides which, it will have an uninterrupted intercourse with the East Indies.

South America is not yet, in its natural course, ripe for fallings off; nor is it likely, from the flow, official, cautions prudence of ich metropolis, to be forced before its time and season to a premature revolt, as North America has been. As long as the Spanish menarches proceeds in administering the affairs and the government of its American establishments, with the temper, address and wisdom which its observes at present, an indolent, luxurious, supersistious people, not much (though much more than the public in general suspects) accordinged to think of political arrangements, will continue in a certain degree of subjection to government, and in a certain degree of acquiescence to commercial restrictive regulations in their sure-pean intercourse, for the sake of a reciprocity of advantage, enjoyement, and protection, which they derive from it. Not being yet,

This Memorial must have been written in or before the year, 1779.

bardened into a temper for enterprize by force of war, they will continue to pay their taxes as a peace offering. But the natives encreasing in numbers, beyond any proportion of the number of Old Spaniards, which the metropolis can fend either as civil governors and magiftrates, or as foldiers; having the executive power of all the inferior snagistracies in their own hands, by their own election of the magistrates; and having invariably, where their choice operates, a decided rule to choose those of their own body; they have, so far as that goes, all the power of internal government in their own hands, in which the mujesty of the sovereign power never interferes; and whatever sovereignty the Spanish monarch holds by the offices of his viceroys, of his judges, of his audiencies, his clergy, or his army however majestic they may look, or however it may appear to individuals, and, in particular exertions, carry terror: it is a mere tenure at good-will. A great country like this, where the community has fo far advanced in agriculture, manufactures, arts, and commerce, wherein there is fuch amplitude and growth of state, is every day growing too large for any government in Europe to manage by authority, at the distance of four or five thousand miles.'-

The Spanish government knows, that they, as well as the English, found themselves under the necessity of repealing an arrangement of revenue which they had made; because they selt that they could not carry it into execution by authority, and they so rightly underflood their strength, as to know that it was not fafe to urge it by force. It is also very well known, that the disputes between the Spanish and Portuguese courts, about the boundaries of the Brazils and the Spamish provinces, arose from their not being able jointly to carry into effect a pacification on the case, because there are Powers in those countries, who would not be bound by the decisions of a government, whose laws are of no authority with them, when opposed to their The powers I mean, are the governing authority of the missions at Paraguay. This is exactly and precisely the state of the case between the metropolitan government of Spain and its provincial establishments in South America. I could, by a detailed description of the nature of the country; of the application of the Pabour of the inhabitants to its capabilities; of the state of the community as it lies in nature, and as it is actuated; all compared with the constitution and administration of the government which is esta-Brished there; with the spirit of the people, both Old Spaniards, Creolee, and Indians, show that South America is growing too much for Spain to manage; that it is in power, to be independent, and will be so in all, whenever, and as soon as, any occasion shall call forth that power. Whenever such revolt takes place, it will not be after the manner or in the form of that of North America. North America building on the foundation of its dominion as it lies in nazure, has become a democratic or aristocratic republic. The falling off of South America will be conducted, in its natural progress, by the spirit of some injured enterprizing genius, taking the lead of a sense of alienation and of a disposition of revolt, to the establishment of a great monarchy.'

The comparison which the Author next proceeds to make between the progress of civilization, commerce, &c. in the Old

and

and New World, has so much originality, and discovers such depth of penetration, that we were tempted to insert the whole

passage: but this would carry us beyond our limits.

This Memorialist next displays the great advantages which America derives from the rapid progress of her population (of which he gives a circumstantial and apparently authentic detail), from the general military education and character of the apeople, and from the liberal spirit of government which already appears amongst them. On these grounds he proceeds to enumerate some of the probable effects, which the establishment and increase of this great empire will have on the commercial and political fishem of the Old World. He foretels, that this great naval and commercial power will shortly be courted by all the maritime powers of Europe, and will become the arbitress of the commercial world \*. If America decline all connections with Europe, other than such as are commercial, and keep herself a FREE PORT to all Europe at large, she will have a FREE MARKET with all the nations with whom the trades, and will. in time, become the chief commercial carrier for the whole world. Every article of her produce and manufacture will meet others of the same kind in all parts of the world, which must operate to moderate the prices of goods. The Americans will become powerful rivals to the Dutch in ship-building; and they will increase the spirit of competition, and commercial activity, throughout the world. They will extend their trade to the East, and contest with the Dutch for the Spice Islands, on the same ground on which they formerly contested with the Portuguese. Their successful commerce and flourishing state will raise a general spirit of adventure, and open the door to emigration. All the maritime states of Europe, seeing the trade of America laid open, will feek for a share in it. This may be attempted either by particular treaties of commerce (which have always hitherto been found ineffectual), or by a General Commercial Council, to fettle the common terms of trade with this Free Port. In such a negociation, all ideas of exclusive privilege, and all monopolizing systems, must be given up as detrimental to all parties; and commerce must be established on the broad, and only secure and beneficial ground, of unrestrained and equal intercourse. Such a General Council of Commerce might remain a perpetual feat of justice, in all disputes respecting trade and navigation; which would be of infinite use to recal the nations of Europe from that state of piracy to which

<sup>\*</sup> The establishment, however, of this supposed new empire in the western world, seems, at present, to be removed to a period of time much more remote than our Memorialist might (not without some appearance of reason) apprehend, at the time of his writing.

they

they are returning, to the total abrogation of the laws of na-

tions, and the entire destruction of all principle.

On these points our Memorialist expatiates at large, with so much clearness of information, and strength of argument, that it is with difficulty we restrain ourselves from making farther extracts from this interesting publication, which is probably the work of some eminent master, who chooses to conceal himself behind a peculiar style, and a sictitious tale.

ART. IV. A Differtation on the Language, Literature, and Manners of the Eastern Nations. Originally prefixed to a Dictionary, Per-fian, Arabic, and English. The Second Edition. To which is added, Part II. Containing additional Observations. Together with further Remarks on a new Analysis of Ancient Mythology: in Answer to an Apology, addressed to the Author, by Jacob Bryant, Esq. By John Richardson, Esq. F. S. A. of the Middle Temple, and of Wadham College, Oxford. 8vo. 7 s. Boards. Murray, &c.

S there hath been an unufual delay in the account of this book, it is necessary to inform our Readers, that it happened to be put into the hands of one of our associates, who, from a peculiar concurrence of circumstances, has been prevented from sooner discharging his obligation to the Public. This Reviewer, however, will not add to the evil already incurred, by taking occasion, from the late appearance of the present Article, to pay a slighter attention to Mr. Richardson's Work than its importance deserves: and as that gentleman, by the publication of the second volume of his Dictionary, hath now completed his whole design, we shall unite together our review of the different parts of this great undertaking.

The first chapter of the Differtation treats on Eastern language, and is divided into three sections. In the first section, the Author makes some observations on the connexion of language with manners, and on the darkness in which the origin of ancient tongues is involved. In giving a short history of the Arabic language, Mr. Richardson observes, that the Koreish tribe, who were the noblest and the most learned of all the Western Arabs, and who were also the greatest merchants, paid such an uncommon attention to the promoting of literary emulation, and the refinement of their language, that their dialect became the purest, the richest, and the most polite of all the Arabian idioms †. It was studied therefore in presence to all the rest; and, about the beginning of the seventh century, became the general language of Arabia; the other dialects being

† See more of this subject in our account of Mr. Richardson's Arabic Grammar, Rev. vol. lix. p. 441.

This Apology we have not feen; and are informed that it was not published.

either incorporated, or sliding gradually into disuse. Pocock, in his presace to the Carmen Tograi, mentions a circumstance which may give some idea of the pains which the Arabians have taken with their language. A King having sent to a grammarian for the books in his possession relative to that tongue, he desired the messenger to inform the monarch, that, if he wished to have them, he must send sixty camels to carry the Dictionaries alone.

Our Author, in the second section, which contains strictures on the language of ancient Persia, is very severe on Dr. Hyde, and on Mons. Anquetil Du Perron. Those fragments of the supposed works of Zoroaster, which Dr. Hyde has given us, under the title of Sadder, are, Mr. Richardson says, the wretched rhymes of a modern Parsi Destour (priest) who lived about three centuries ago: whilst the publications of Mons. Anquetil Du Perron (Oriental Interpreter to the King of France) carry palpable marks of the total or partial sabrication of modern times. In support of this idea, some remarks are made on the Zend Avesta, published by him, from whence it is concluded, that the Zend language is not genuine, and that M. Anquetil has produced no discovery which can stamp his publications with authority\*. The specimens of old Persian, in Hyde's Religio Veterum Persarum, are afferted, likewise, to be simply modern language in ancient characters.

These charges are farther confirmed in the third section, in which Mr. Richardson relates the changes introduced, by the Arabian conquest, in the government, religion, and language of Persia. Both the Macedonians and Arabians persecuted the religion of the Magi, and destroyed their books; and the confequence of these persecutions, as well as of the general ravages of time and conquest, was, that the original works of the Persian lawgiver have long been lost; and nothing now remains, bearing the names of those once celebrated books, but the absurd ceremonials of the modern Guebres, which preserve, apparently, no nearer resemblance to the ancient worship of Persia, than the corrupted tenets of the Mingrelians or Georgians have to the Christian religion. Even the Parsis of Guzerat acknowledge, that so far from now possessing the ancient books of Zoroaster, they have not so much as one single copy saved by their ancestors from the general wreck in the leventh century. The tenth century was the great epoch of the revival of Persian learning, and from that time till the fifteenth century was its most flourishing period. The epic poet Firdousi displays an imagination and importantly of numbers hardly inferior to Homer. From the above period, a literary rivalihip seems to have subsisted

See our account of the Zend Avefia, in the 45th volume of our Review, p. 561.

amongst the Mohammedan princes who had dismembered the Khalisat; every Sultan considering it as an object of the first consequence, to number amongst his friends, the most celebrated poets or philosophers of their age. No expence was spared to allure them to their courts; and no respect was wanting to fix a continuance of their attachment. Some striking instances of the attachment of the Eastern princes to men of genius are related by our Author, who concludes the section with an account of the causes which, for the last three centuries, have almost extinguished the literary fire of the Persians and Arabians, and with pointing out the usefulness of the Persian and Arabic languages.

The second chapter, which is upon ancient oriental history and tradition, and comprises six sections, contains a variety of curious and ingenious matter, mixed with some very questionable affertions and observations. Having employed the first section in descanting upon the uncertainty of history in general, Mr. Richardson proceeds to give a short view of the early periods of the Persian history, which he acknowledges to be disfigured by the marvellous, though he thinks that it ought not to be entirely rejected. The disagreement between the Grecian and the Asiatic history of Persia is represented by him in the sol-

lowing terms:

'The Kaianian dynasty being supposed then to commence nearly about 600 years before the birth of our Lord, this brings us to the reign of that King of the Medo-Persians, called by the Greeks Cyexeres; which, according to Sir Isaac Newton's conjecture, is supposed to have begun in the year of Nabonasar 137 (about 610 before Christ). From this period till the Macedonian conquest, we have therefore the history of the Persians, as given us by the Greeks; and the history of the Persians, as written by themselves. Between those classes of writers, we might naturally expect some difference of facts; but we should as naturally look for a few great lines, which might mark some similarity of story: yet, from every research which I have had an opportunity to make, there feems to be nearly as much refemblance between the annals of England and Japan, as between the European and Asiatic relations of the same empire. The names and numbers of their Kings have no analogy; and in regard to the most splendid facts of the Greek historians, the Persians are entirely silent. We have no mention of the Great Cyrus, nor of any King of Persia, who, in the events of his reign, can apparently be forced into a fimilitude. We have no Crassus, King of Lydia; not a syllable of Cambyfes, or of his frantic expedition against the Ethiopians. Smerdis Magus, and the succession of Darius, the son of Hystaspes, by the neighing of his horse, are to the Persians circumstances equally unknown as the numerous affaffinations recorded by the Greeks. Not a vestige is, at the same time, to be discovered of the samous battles of Marathon, Thermopylæ, Salamis, Platea, or Mycale; nor of that prodigious force which Xerxes led out of the Persian empire to overwhelm the states of Greece. Minutely attentive as the Persian historians are to their numerous wars with the Kings of Turan or Scythia; and recording,

cording, with the same impartiality, whatever might tarnish as well as aggrandize the reputation of their country; we can, with little pretence to reason, suppose, that they should have been filent on events of such magnitude; had any record remained of their existence, or the faintest tradition commemorated their consequences. Xerxes, according to Herodotus, crossed the Hellespont, attended by no fewer than 5,283,220 souls, and escaped back alone in a sishing-boat; the whole almost of this mighty host perishing by the sword, by famine, or by disease. The destruction of such a number would have convulsed the whole of Asia, had it been united under one empire: could it possibly have been unselt in Persia? Can any man who has made the least observation, at the same time, on history, suppose, for a moment, that fuch myriads could by any means have been maintained in one collected body; even in the present times, when the art of war, in that particular department, has arrived at a degree of perfection unknown in those ruder ages. The greatest armies, of which we have any rational information, are those of Jengiz Khan and Tamerlane, the most despotic and the most powerful conquerors on record: yet these princes, in all their mighty atchievements, were feldom followed by 400,000 men. We are told, indeed, that the army of Tamerlane, on his return from the conquest of India; when he meditated the destruction of Bajazet, and of the Sultans of Egypt and Baghdad, amounted to near 800,000 men, previous to the battles of Damascus and Ancyra. Yet those troops were dispersed in different divisions; they were besieging many distant places at the same period of time; and were not, after all, a fixth part of the reputed army of Xerxes: though Tamerlane possessed then an empire and an authority incomparably superior to that of the Persian monarchs in the highest zenith of their power; and was then marching against potentates of infinitely higher political consequence than the Grecians at the supposed period of this tremendous invasion. But the flates of Greece appear, in fact, with regard to the Perfians, to have been too far removed from that degree of importance which could hold them up as objects of such high ambition, or of such mighty resentment. Till the reign of Philip of Macedon, they are hardly mentioned by the Persian writers, but as tributaries to the Persian empire. Those famous invasions may possibly therefore have been simply the movements of the governors of Asia Minor; to enforce a tribute, which the Persians might often claim, and the Greeks might never pay. Marathon, Salamis, and other celebrated battles may indeed have been real events; but " numerous as the fands on the " shore," is an idea which, in all times, has been annexed to defeated armies: and the Grecian writers, to dignify their country, may have turned the hyperbole into historic fact; and swelled the. thensands of the Persian Satrap into the millions of the Persian King.'

It is not impossible, according to our Author, that some of these famed events may have been the mere descents of pirates or private adventurers; either with a view to plunder, or to retaliate some similar expedition of the Greeks. Piracy being deemed honourable in ancient times, there may have been many subjects of the Persian empire in that profession. "Greece, as well as other countries, may have been often the theatre of their rapine

rapine and devastation: whilst their success or discomsture must have been events of too little moment to reach the ears or engage the attention of the Shahinshah, or King of Kings, at the remote cities of Persepolis and Balkh." Such are Mr. Richardson's sentiments; and, in the farther course of his enquiry, he is able to trace only one single sact of consequence in which the Eastern and Grecian historians agree, and that is, the Macedonian conquest. Even with regard to this event, the detail of the Persian corresponds with that of the Grecian writ-

ers in nothing but the catastrophe.

In the third fection, our Author pursues his plan, of discrediting the accounts the Greeks have given of the affairs of Persia, by arguments which, though ingenious, are so evidently precarious and conjectural, that we shall not trouble our Readers with any notice of them. What he advances, in the next section, concerning Queen Semiramis, the Argonautic expedition, Sesostris, and the contradictions in the Grecian historians and the modern chronologers upon these subjects, is more to the purpose. Certain it is, that the story of the Argonauts abounds with too many inconsistencies to be worthy of much credit; and the reasons assigned by Sir John Marsham and Sir Isac Newton, for supposing the Shishak, King of Egypt, mentioned in Scripture, to be the same person with the samous Sesostris of the ancients, though not destitute of plausibility, and approved of by several learned men, will scarcely stand the test of fober investigation.

Mr. Richardson, in the fifth section, undertakes to shew,.. that the chronology of the Sacred Writings has been perplexed by endeavouring to reconcile it with that of the Greeks. Under this head, he treats the opinion fo generally entertained by divines, that the famous Cyrus was foretold by the prophet Isaiah, as absolutely groundless, and supports his own sentiment by some chronological arguments, which, to say the best of them, are very precarious, and in which, indeed, we have ourselves no doubt of his being mistaken. As an attachment to the chronology of Greece seems, in our Author's estimation, to have led to many unnecessary liberties with Scripture, he considers how far the historians of Asia correspond with the sacred writings. But the correspondence pointed out by him appears not a little imperfect, and is not, we apprehend, more worthy of notice than the systems of the writers whom Mr. Richardson has exploded. The stress he has laid on those modern compilations, the Jewish Chronicles, induces us to believe that his strength doth not lie in chronological enquiries and discussions. The apparent conclusions to be drawn from the whole of his preceding observations are, he says, 'That the Greeks and Romans in their ancient histories, especially of diftant

distant countries, are often wrong; and, in general, liable to suspicion: that their accounts of the East, as well with regard to manners, as historic facts, are inconsistent with the Asiatio authors; irreconcileable with Scripture; contradictory in themselves; and often impossible in nature: that as the later writers, Diodorus, Strabo, Płutarch, are often in complete opposition to the earlier historians, and complain of the repugnances with which they are every where perplexed, nothing can more strongly point to a fundamental error: that modern chronologers, commentators, and compilers of ancient history, differ likewise greatly in opinion; supporting frequently their systems by points of a most doubtful complexion, and rejecting others of a far more probable appearance: that a resemblance in names is often preferred to a confishency in facts: that the inventions of superstition, or the fictions of poets, are often viewed as real eventa; and the same critical accuracy employed in fixing the early epocha of imaginary beings, as in resolving the most rational truths of more authentic times: that such being the uncertain bales of ancient flory, no materials ought to be despised: that the Persian and Arabian historians are entitled to attention in whatever regards their own countries; their relations being grounded at least on national belief; and national belief never originating without some foundation: that the mere priority in time of the Western to the Eastern writers, when unsupported by circumstances of higher evidence, should give no preference in regard to authority; as, upon the same principles, we might rank a Ctesias before Plutarch; a Roger de Hoveden before Hume; or a Gregory of Tours before De Thou: that we may perceive fome strong lines of truth in the Eastern historians, from their concurrence with the Bible, in the few facts mentioned above \$ whilst even their silence on some heads, with their slight variation in others, furnish high presumption of their authenticity: for had they been exactly in conformity with the Scripture, we should naturally have concluded, that their materials had been borrowed from thence; and confidered them merely in thelight of translations. But the manner in which they are told shows, that the great lines were independently known in Perfia; and that the difference is simply what might have been expected between facred writers, who had every opportunity of information, and the annalitts of another country, who neither had such advantages, nor were so deeply interested in the

Were we to make distinct remarks on every thing advanced by our Author which might admit of doubt and discussion, we should be carried far beyond the bounds to which this article must be confined. But it is impossible to pass over what he hash said concerning the Grecian history of the Persian empire Rev. Aug. 1780.

without notice. No reasonable critic can have the least objection to the fullest and freest inquiry into this matter. As it is undoubtedly right that the Eastern historians should have a fair and candid hearing, we fincerely wish that their accounts may be produced and examined, and that every degree of credit may be paid to them which they shall be found, upon a close and fober investigation, to deserve. Neither have we such a bigoted attachment to the Greek writers, as not to be sensible that they are liable to mistakes, that they are probably very erroneous with regard to numbers, and that they may have been misled by national vanity. But, after all, Mr. Richardson must be capable of affording us a prospect of a far superior evidence to what he has hitherto given, before he can persuade us to reject the relations of the Grecian historians in so peremptory a manner as he hath done in the passages above cited. It is not easy to conceive that these historians could be so totally ignorant or misinformed in the events recorded by them. They wrote at a period which was near the time when the facts related by them happened. They wrote whilst the Persian empire subsisted, and whilst its connection with the republics and colonies of Greece was an object of the greatest notoriety. They were themselves enlightened and polished men, and wrote among an enlightened and polished people. Their histories were recited before the Grecians and others, who affembled together, from all quarters, at the public games; and were an appeal to the knowledge of every man that was present. Xenophon in particular, who was so excellent a philosopher as well as an historian, and who posfelled a calm and candid mind, had the opportunity of going far into the territories of the Persian empire, and by his engagements with the younger Cyrus and his adherents, could not fail of receiving much authentic information concerning that empire. But it is not upon the testimony of the Greek historians alone that the credit of the leading facts, with relation to the monarchy of Persia, depends. These facts are continually alluded to, and confirmed, by the Grecian poets, orators, and philosophers; and the evidence that might hence be collected would be found uncommonly striking and important. To suppose, therefore, as Mr. Richardson has done, that the connections between Greece and the Persian empire were events of too little moment to reach the ears or engage the attention of the King of kings, is carrying historical scepticism to a most unjustifiable extrava-We are afraid that our Author, during his study of the Eastern languages, forgot his Greek learning; for we will not fay, that if ever he had paid a proper regard to it, he could not have advanced so strange a supposition. What is it, too, that he has to oppose to the accounts of Persia lest us by the Grecians? He hath himself informed us, that the ancient Persian

Mterature was almost entirely annihilated by the Arabian conducted in the seventh century; and that the principal historians of Persia, now known in Europe, are all subsequent to the Mohammedan æra. Firdousi, who is the oldest of these writters, lived 1500 years after Cyrus, and 350 years after the destruction of the second Persian monarchy. He was likewise, according to Mr. Richardson's own description of him, an Epic Poet, who, in his romantic history of the Kings and Heroes of: Persia, displays an imagination and smoothness of numbers hardly inferior to Homer; and who hath interwoven in his poems the whole fanciful range of Persian enchantment. Until, therefore, some better authorities can be produced than we have yet any account of, the Greek historians must be permitted to retain their general credit.

While our Author was engaged in displaying the utility of the Arabic and Persian languages in throwing light on early, times, it was scarcely possible that he should avoid taking notice of Mr. Bryant's celebrated analysis of ancient mythology. That. very learned gentleman, though confessedly ignorant of these languages, hath, nevertheless, dealt largely in etymology; and, endealeured to confirm his system from particles and words which are evidently of Eastern original. Here then is opened a fair field of discussion; and accordingly, Mr. Richardson has employed the fixth fection of his fecond chapter in confidering. the subject. After slightly touching on what Mr. Bryant has advanced to establish the universality of the deluge from Gentile authorities, our ingenious writer examines more at large the Cuthite or Amonian worship of the Sun and Fire; as the throngest arguments may hence be deduced, to demonstrate the utility. of the Arabic and Persian languages, in relation to the history and mythology of ancient times; and to show convincingly, at the same time, that the most intimate acquaintance with the literature of Greece and Rome will lead the greatest critical acumen but a little way without such assistance. The result of our Author's strictures on Mr. Bryant's etymologies, is, that though, like an able General, that gentleman has made admirable dispositions even on bad ground, and his arguments will ever command respect, yet the stations he has chosen must baffle all his skill to defend. Without an acquaintance with the Eastern tongues, says Mr. Richardson, all analysis of Eastern names must be completely fanciful: for whilst numbers of words, which may be expressed perfectly alike in European characters, have roots and meanings totally different; others, which, in the eye of a stranger to the dialects, may bear no resemblance, will claim the same radical origin, and possess little variation of sense. Widely differing, therefore, as those Eastern inflexions are from the genius of European tongues, it must

be evident, even to those who have never made them an object of study, that the same principles which might guide an inquirer through the etymologies of the one class, must, in gene-

ral, palpably mislead his researches in the other.'

The third chapter of the first part of the work before us, confifts of ten sections, and comprehends many entertaining obfervations on eastern manners. The subjects here considered by Mr. Richardson, are, the channels through which Eastern cuftoms may have flowed into Europe; the prevalence of the feudal lystem in the East in early times; oriental notions of supernatural beings; the old Persian æra, and the sessivals celebrated by the Persians in honour of their superintending angels; the traces of chivalry in the East, and the importance of women among the Arabians, Persians, and Tartars; the Eastern music; private war, and compositions for homicide; the generosity and hospitality of the Asiatics; the trial by Ordeal; and the administration of justice. We could enlarge, with pleafure, on what our Author hath faid upon these topics; but we must be contented with referring our Readers to the Differtation itself.

[To be concluded in another Article.]

K.

ART. V. Memoirs of the Life of David Garrick, Esq. Interspersed with Characters and Anecdotes of his Theatrical Contemporaries. The whole forming a History of the Stage, which includes a Period of Thirty-fix Years. By Thomas Davies. 8vo. 2 Vols. 10s. Davies. 1780.

T is happy for the memory of David Garrick, that his history has been given by a writer who knew him well, and who was duly qualified not only to delineate, with truth, the portrait of the man, in private life, but to judge rightly of his public merit:—to do justice both to his moral character, and to his professional excellence.

Mr. Garrick, in the opinion of many, who knew him not intimately, was a versatile character, formed by nature on a plan

fimilar to Dryden's Zimri:

A man so various, that he seem'd to be Not one but all mankind's epitome—

But this is not the precise idea; for Garrick must then have had much bad as well as good in his composition; which was by no means the case. He was not, it is true (any more than other men), free from failings; but his failings were few, and of no great magnitude. Goldsmith seems to have formed a juster notion of him, when he happily characterized him as

An abitract of all that is pleasing in man.

Mr. Garrick has been often censured as an avaricious man a charge which is warmly and, we believe, justly obviated by Mr. Davies; who observes that, by some he was said to be parsimonious, nay, avaricious: others gave out that he made too great and oftentatious a parade of magnificence, unbecoming the condition of a player. To attempt to please all the world, would be just as idle, as to despise its censures when sounded upon truth or probability. Mr. Garrick kept a plentiful table; he rejoiced to see his friends at his board; he kept horses and carriages, and had a number of servants, and equipage, such as became a man of his large fortune; but all his expences were regulated by the strickest eccamony.

That Mr. Garrick took delight in accumulating (well-earned) wealth, is a supposition not to be controverted; nor is he to be censured for procuring and insuring to himself, by the laudable exertion of those rare faculties which nature had so abundantly bestowed on him, the godlike pleasure of distributing that wealth, to make others as well as himself happy.—It is the man of economy alone, who is able to do this without departing, in any instance, from the right line of justice to all. The sons of extravagance and prodigality may promote the interest of individuals by their profusion, but as they do not mean well, they merit no commendation: on the contrary, the contempt and derision of mankind is all the recompence they can expect to obtain for their thoughtless dissipation and ruined fortunes.

That Mr. Garrick's generosity was great, if not unbounded, we wanted not the testimony of Mr. Davies to inform us; but

Mr. Davies pronounces jealousy to have been Mr. Garrick's worst fault.' It was in him, says our Author, 'little less than envy, that hateful disease of the mind, from which sew men are exempt, yet what all men disown; for I never knew any man, but one, who had the honesty and cour see to confess that he had a tincture of envy in him †. He, indeed, generously owned that he was not a stranger to it; at the same time he declared that he endeavoured to subdue it.

Mr. Garrick, who scarce ever had a competitor, and, perhaps, will never have an equal, was weak enough to be alarmed at every shadow of a rival. Though, in the opinion of the world, he stood upon a pedestal, looking down upon all actors as his inseriors; yet, sometimes, from the impulse of theatric jealousy, he would condescend to raise the meanest shrub of the stage to a level with himself. This seems to have been a proper punishment for his want of candour; for I never remember to have heard him speak warmly in the commendation of any actor, living or dead. If great examples can excuse or alleviate a fault so unworthy of such a man, we can bring a Pope, an Addison, and many others, to speak for him, who were equally guilty, with a much greater degree of ill-will.

for the satisfaction of our Readers, we shall here take the opportunity of transcribing what our Biographer has advanced on this head,—as it will be no disagreeable specimen of his style and manner.

'The abhorrence of profusion and waste he imbibed from his earliest years; and this moderation, during that tide of wealth which slowed in upon him constantly, enabled him to do many acts of kindness and charity. No man seemed more anxious to get money, and none more willing to bestow it generously. To those who knew the sums he constantly gave away, it would appear, that his sole end of acquiring wealth was for the benefit of others. I shall not talk of his more public charities and contributions; I mean such actions only as were less known to the world; his benevolence was not a sudden start of humour, as shewed itself in such acts of favour as proceed from sudden whim and caprice; his bounty resembled a large, noble, and slowing river,

That glorify'd the banks which bound it in.

It was a very honourable circumstance of his life, that in the very dawnings of success, when he sirst tasted of fortune's savours, and had acquired a very moderate portion of riches, he opened his hand to those who solicited his kindness, and was ready to affist all who applied to him. His mind was so bountiful, that he scarce knew what it was to deny. He was once solicited by a friend to give a trisle to a poor widow. He asked how much he should give. About two guineas. No, that I will not. Why, then, give what you please, He presented his friend with a bank-note of 30 l. Of this I should despise the mention, if it were a matter of rarity and wonder. A gentlewoman, who had known him from his youth, and had been acquainted with his relations at Lichfield, applied to him for assistance in her necessities. He made her a present of one hundred pounds. He had several almoners, to whom he gave sums of money to distribute to such objects as they approved. Heaven only knows the extent of that beneficence which slowed continually from this large-minded man.

There are two remarkably generous deeds of Mr. Garrick, which are so well authenticated, that it would be an act of injustice to his memory to conceal them from the world. A gentleman of fashion, and a man universally beloved and esteemed, borrowed sive hundred pounds of Mr. Garrick, for which sum he gave his note of hand. By some vicissitude of fortune the affairs of this gentleman were greatly distressed; his friends and relations, who loved him, were determined to free him from uneasiness, by satisfying his creditors. A day of meeting for that purpose was appointed, on which they were to be very cheerful. Mr. Garrick heard of it, and instead of taking advantage of the information to put in his claim, he inclosed the 5001. note in a letter, in which he told the gentleman, that he had been informed, that a jovial meeting was to take place between him and his friends, and that it was to be a bonfire-day, he therefore desired he would consign the inclosed note to the slames.

The other anecdote is still more to Mr. Garrick's honour. He was very intimate with an eminent surgeon, who died several years since, a very amiable man, who often dined and supped with Mr. and Mrs. Garrick. One day after dinner the gentleman declared,

that

that his affairs were in such a situation, that without the assistance of a friend, who would lend him a thousand pounds, he should be at a loss what to do. A thousand pounds! said Mr. Garrick, that is a devilish large sum! Well now, pray what security can you give for that money? Upon my word, replied the surgeon, no other than my own. Here's a pretty sellow, said Roscius, turning to Mrs. Garrick, he wants a thousand pounds upon his personal security! Well, come, I'll tell you one thing for your comfort; I know a man, that at my desire will lend you a thousand pounds. He immediately drew upon his banker for that sum, and gave the drast to his stiend. Mr. Garrick never asked for, or received a shilling of it.

Innumerable stories of humanity, generosity and charity, could be told of him, enough to fill a volume. I have heard Dr. Johnson say, that he believed David Garrick gave away more money than any man in London. Some, perhaps, may call his charity oftencation; be it so, but oftentation is not avarice. Strip every man that does an act of kindness of the love of same in doing it, and to what a small heap you will reduce that vast mountain of benevolence of which the world now boasts! Such oftentation as Mr. Garrick's, if it was oftentation, was a glorious virtue; and I heartily wish he had

many imitators.

The true character of a man is always more accurately known to his neighbours than to the world at large; to those who live with him, near him, and round about him, than to persons at a distance. Go then, you who still entertain a doubt of Mr. Garrick's charity and benevolence; go to Hampion, and learn what every inhabitant of that village will say of him; they will tell you, from their own knowledge and experience, that his lofs is generally and heavily felt; that it is so great, they cannot hope it will be soon repaired; that the poor inhabitants of that place have, in him, lost a kind friend and an affectionate father; that his benefactions to them were continually increasing; that, amongst other instances of his paternal regard for the poor, he had, a few years before his death, instituted a little an-awal featt for children. Every first of May he invited all the chilcren of the village to come into his garden; there he distributed to them large pieces of cake, with a finall prefent of money; and on this anniversary, I have been told, it was his intention in future to have increased his donations. He was as great a proligy of unlimited bounty, as of extensive genius.

To conclude: No man of his profession had ever been so much the object of admiration; sew men were ever more beloved; nor was any man better formed to adem society, or note sincerely disposed

and qualined to serve mankind, than David Garrick.'

In the next number of our Review, we propose to give a father account of this very entertaining and agreeably written piece of biography;—a work which may be considered (as the title-page imports) not merely as an account of the life of our celebrated Roscius, but as the history of the British stage during Mr. Garrick's time:—we may add, during the time of the Writer himself,—than whom, perhaps, no man living is better acquainted with the subject. What we have laid before ou

Readers, may therefore, be accepted only as the general introduction to our review of Mr. Davies's judicious and pleafing performance.

ART. VI. Historia Naturalis Testaceorum Britanniæ; or, the British Conchology; containing the Descriptions and other Particulars of Natural History of the Shells of Great Britain and !reland. Illustrated with Figures. In English and French. By Emanuel Mendes da Costa, Member of the Imperial Cæsarian Academy Naturæ Curiosorum, by the Name of Pliny IV. and of the Botanic Society of Florence. 4to. 11. 12. plain.—Coloured, 11. 112. 6d. Printed for the Author, and sold by Millan, Elmsley, White, and Robson.

T is no sufficient objection to any study, that it admits of no valuable application to the great purposes of life. If it afford relief to the mind from more important cares and pursuits, it has considerable value in itself, under the class of innocent amusements. A man who chooses to entertain himself in his leisure moments in solving problems of mere curiosity in algebra, in determining questions of equal insignificance in criticism, or in distinguishing and classing shells in natural history, is not more deserving of ridicule or censure than he who employs the same moments in a game at chess, or a rubber at whist.

If therefore the science of conchology had no pretension to utility, we should not be disposed on that account to treat it with contempt. But we have already, in our review of this Author's ELEMENTS OF CONCHOLOGY (See Rev. Feb. 1777, p. 91.), allowed to this study an higher rank of merit than merely as an innocent amusement, acknowledging it to be favourable to the improvement of elegant tafte, and even of pious fentiments. If we are not possessed of a sufficient share of enthusiasm in this pursuit entirely to adopt the idea of our Author; "That a cabinet of shells is a volume of fine wrote [finely written] fermons, and that those who read them attentively will find their morals improved by the perusal;" we readily grant, that this study is capable of giving pleasure, not only by exhibiting elegant forms and beautiful colours, but by affording exercise for the powers of discrimination, equally with almost any other walk of nature.

The admirers of this elegant branch of natural knowledge will esteem themselves much indebted to the Author of this work, for the accurate descriptions which he has given of the several species of shells, and the ingenious manner in which he has arranged them.

In this work the Author closely follows the system laid down in his *Elements*:—but our Readers will be best informed of the

plan

plan and execution of The British Conchology in the Author's own words.

As it is necessary to give shells some trivial names for distinction fake, I have, in doing it, always endeavoured to form the denominarien on some idea arising from the Shape, texture, or colour. &c. but when no such correspondent circumstances suggested a name, the choice of one necessarily became arbitrary.

I much doubt whether my descriptions may not be sometimes taxed with prolixity; but the object of Natural History will, I hope, excuse it: Precision, not Elegance, is required.

I have quoted all the jynonyms of authors at large; they are left liable to error than quotations only of figures or of pages, and elucidate the authors themselves. These quotations are placed according to the order of time when the authors respectively flourished; but this work being a British Natural History, the British authors are placed before those of foreign countries.

Attention has been paid to note the chief places where each species is found, except when the shell is very common: and to many I have added the other countries of which the same species is a native, that a comparative view may be formed of the various climes in which the same species exist: a particular which I judged would be both curious

and instructive.

Another circumstance to be premised is, that I have been very. cautious in fixing the Species of these kingdoms. Authors are liable to be imposed on: thus Sir Ro ert Sibbald nad he pearly or Eatl-Indian. nautilus sent hin from the Western Islands of Scotland; D. Plet was imposed on even by an Oxford Professor, in his currous land snail of Cornbury Park, in Oxfordshire, of which he has given a figure; and Dr. Lister was most probably imposed on by the sithermen of Searberough, in the firembiformis bicarinatus, described No. 64.-Other like initances occur, even without any defign of deceit. I have received a fine volute from Scarborough; rbembi from other English coasts; and the grimace buccinum from the shore of Suffex. My conduct in such cases has been to reject all fingle instances, and admit none but such as were determinable, either by repeated objervations, or the quantity of the species found; for fingle examples are not positive proofs, they may bappen cafually.

1 have described the shells from the objects themselves, except in fix inflances, where I could not procure the originals to complete the feries; in which cases I have borrowed them from authors of veracity; and the Reader will find those species distinguished by Reman.

characters, and the authors quoted verbatim.

 No expense has been spared in the engraving and colouring the plates, and I flatter myself they will meet with the public approbation.

The species of British Univalves here set forth are sighty six. I am very sensible that several pecies of shells, yet unknown to me, remain to be discovered in these kingdoms. Should any Ladies or Genclemen, curious in these pursuits, be kind enough to communicate to me any new observations or discoveries, I shall with all dees thanks acknowledge the honour they confer on me, and, if of any a number, they shall hereafter he printed in the same form with this...

work,

work, as an Appendix; for I think to renew editions, for the sake of a few additions, is an unjust tax on literature.'

This last remark we beg leave to recommend to the general attention of authors.

ART. VII. Practical Observations upon Amputation and the Aftertreatment, by Edward Alanson, Surgeon to the Liverpool Infirmary. 8vo. 1s. 6d. Rivington, 1779.

Writer, is to accelerate the healing of stumps after amputation, and to prevent that protrusion of the bone which is so often the consequence of the usual mode of performing that operation. The improvements he suggests relate both to the manner of operating, and to the method of dressing. As they appear to us well calculated to promote their end, we shall give in his own words a detailed account of the amputation in the

thigh, as now practifed in the Liverpool Infirmary.

Apply the tourniquet as usual, and let an assistant draw up the skin and muscles, by firmly grasping the limb with both hands. The operator then makes the circular incision as quick as possible through the skin and membrana adiposa, down to the muscles. He next separates the cellular and membranous attachments with the edge of his knife, till as much skin is drawn back as will afterwards cover the surface of the stump with the most perfect ease. The assistant still firmly supporting the parts as before, apply the edge of your knife under the edge of the retracted integuments, and cut obliquely through the muscles upwards as to the limb, and down to the bone; or, in other words, cut in fuch a direction, as to lay the bone bare about two or three fingers breadth higher than is usually done by the common perpendicular incision, and continue to divide, or dig out the muscles all round the limb, by guiding the knife in the same direction. The part where the bone is to be laid bare, whether two, three, or four fingers breadth higher than the edge of the retracted integuments, or, in other words, the quantity of muscular substance to be digged out, in making the double incision, must be regulated by considering the length of the limb, and the quantity of skin that has been previously saved, by dividing the membranous attachments. The quantity of skin saved, and of muscular substance taken out, must be in fuch an exact proportion to each other, as that, by a removal of both, the whole surface of the wound will afterwards be easily covered, and the length of the limb not more shortened than is necessary to obtain this end. The bone being now bare all round, is to be divided, as usual, with the saw, and as high up as possible, which will be more easily executed, if the retractor, recommended

recommended by Gooch and Bromfield, is first applied, for the

support and defence of the fost parts.

After the removal of the limb, let each bleeding artery be gently drawn out with the tenaculum, and tied with a common ligature as naked as possible. The whole surface of the wound is now to be well cleaned with a sponge and warm water, as, no doubt, any coagula remaining upon its furface, or about the interstices of the muscles, would be a considerable obstruction to that defired union, which we have always in view through the whole plan. Let the skin and muscles be gently brought forwards; then fix the flannel circular roller round the body, and carry it two or three times round the upper part of the thigh, where it will form a sufficient basis, that will greatly add to the support of the skin and muscles; then carry it forwards in a circular direction till it arrives fufficiently near the extremity of the stump, where it is to be fastened as usual. You are now to place the fkin and muscles over the extremity of the bone, in such a direction, that the wound shall appear only as a line, drawn down the face of the stump, terminating with an angle, above and below, from the latter of which the ligatures are to be left out, it being the most convenient and dependent part. The skin is easily secured in this posture, by long slips of linen, or lint, about two fingers breadth, spread with cerate, or any foft cooling ointment: these are to be brought from side to fide across the face of the stump; then apply over them a little foft lint, with a tow pledget, and compress of linen, the whole to be retained with a light linen roller.

Such is Mr. Alanson's description of his method; the chief defign of which feems to be the procuring an union by the first intention between the preserved skin and the extremity of the stump. He assures us, that it has in fact proved as efficacious and successful as we could from reasoning suppose it; and in particular, that the application of the circular roller has not, as one might have apprehended, occasioned a return of hæmorrhage in any of his operations. In one respect only the proposed method feems to us subject to criticism. We do not well relish the idea of digging out the flesh with the knife by means of the oblique upward direction of the incision; a manœuvre, we conceive, troublesome to execute; considerably augmenting the pain of the operation; and, from the writer's own account, unnecessary. For he tells us (p. 10.), that by a proper division of the integuments, as much skin may be faved as will fully cover the whole surface of the wound with perfect case. What more need be wished ?

A case of amputation of the arm at the shoulder-joint is subjoined, which proved remarkably successful, and will suggest many useful remarks to the intelligent practitioner.

ART. VIII. The Intrigues of a Nabob, or Bengal the fittest Soil for the Growth of Lust, Injustice, and Dishonesty. Dedicated to the Hon. the Court of Directors of the East India Company. By Henry Frederick Thomson. Small 8vo. 4s. Printed for the Author, near the Swan Inn, Bishopsgate Without. 1780.

E learn from this Author's account of himself, that, inflamed with wine, and bent on a frolic, he one evening vifited the round-house, with a constable of Covent Garden of the name of Farrell. This adventure (the effect of mere wanton curiosity) happened about October 1767. Trifling as It was in itself, yet it unfortunately proved of very serious consequence to our Author; for it was the source of all the calamities and disappointments which his book records. at the round-house that he first beheld the woman, who having secured him for her lover by the power of her charms, continued, for a long time, to make him her dupe, by the dexterity of her address. This wily and ungenerous female was called Bonner. Her beauty, as we are here informed, was her principal secommendation; for the few mental accomplishments with which the was endowed were chiefly confined to the line of in-

trigue.

Having suffered from his connection with this Cyprian dame, he resolved to dismiss her with the infamy which her imposition on his confidence and generofity justly merited. But the reso-Intion of a momentary fit of refentment was foon lost in the foothing eloquence of love. He forgave the weeping penitent, who was equally skilled to "faint it" or to "finner it," as it might best answer the purpose of her pleasure or her profit. Kindling with fresh ardour, his love gained a second birth from the ashes of her repentance. He again admitted the lovely Magdalene to his arms; and, in the moment of returning ardour, would have completed the last resolution of folly by making her his wife, had not prudence very opportunely interposed, and prevented a connection that he judged to be improper, not so much from her want of virtue, as her want of education: for though pretty, she was not polished; and however formed to gratify a sensual taste, she was not calculated to prefide with elegance or decorum at Mr. Thomson's table. Nevertheless, though his pride forbade him to have such a girl for his wife in reality, yet it did not prevent him from bestowing on her the credit of the name. Miss Sarah Bonner then, without asking leave of the priest, became all at once Mrs. Thomson; and under that very respectable name and character she was introduced by her nominal husband to his own family. To give something of an appearance of education to a creature who had been hackneyed only in the manners of a low and licentious: life,

life, he placed her under the tuition of a woman who kept a

boarding-school, near London.

In the mean time the Author set sail for Bengal, with many recommendations from some gentlemen of the India-House to the patronage of Mr. Vereist and some leading members of the Council. The success of these recommendations was not indeed answerable to the hopes of Mr. Thomson, From Calcutta he failed, as second officer on board a freight-ship, to China (Feb. 1769), about eleven months after his departure from England. At his return from China (Feb. 1770) he was informed that his "supposed wife" had been in Bengal near four. months, and had been attended thither from Europe by his ownfifter. Amidst the high pleasure which his fond heart flattered him with the enjoyment of, in the company of his beloved object, there was a scheme laid to seduce her affections from him; -which scheme, artfully laid and secretly conducted, effectually. answered every purpose of the seducer, and, in the event, ruined the fortune as well as the repose of Mr. Thomson. This insidious. seducer was no less a person than Mr. R — d Ba——II, whose name is not a little conspicuous in the annals of the East. If we are allowed to pay any credit to Mr. Thomson, this Mr. Ba----ll must have foully betrayed the confidence which was reposed in him, and violated every law of friendship and hospitality, honour and justice. It was owing merely to accident, and Mrs. Thomson was detected. One Cator, Bapimp, was not so dexterous as pimps ought to be in slipping a letter into Mrs. Thomson's hands. Our Author perceived it. His jealousy was instantly roused: and the sears it excited were afterwards confirmed by a discovery of a number of letters from the same gentleman. Those letters are now presented to the. public, in the order in which they were fent to Mrs. Thomson. They contain the most ardent expressions of love, and frequently refer to an illicit gratification of it. We are also prefented with a specimen of Mr. Ba—Il's poetical talents—viz. a copy of verses, most lusciously descriptive of Mrs. Thomson's charms and Mr. Ba---ll's trembling pulses, mighty transports, rapturous agonies, and extatic palpitations, &c. &c.a prayer'-" A prayer?"-Yes-a prayer, worthy of a licentious Nabob dissolved in the luxury of a Haram--- a prayer to Love!'—and 'an apology'—for making himself such a sool!

Through every period of this infamous amour, Mr. Ba——II thought that the lady was in truth the legal wife of the very man whose interest he was at the same time professing to promote on the most disinterested plan of friendship. Probably this very circumstance heightened the charms of seduction, and made his "stolen waters more sweet." What is common is not

valuable; and that which may be procured without fear, is fre-

quently enjoyed without satisfaction.

From one of Mr. Ba——Il's letters we may collect a striking outline of his morality. He hath also in a few unequivocal words delineated (though unwittingly) that system of right and worng which our Asiatic despots have been very ready to adopt and act upon in more respects than in the matter of seduction. We will transcribe his own words, when declaiming on the use and intent of passions. 'As our passions do not depend upon ourselves, we must be sensible they were given us to answer some great end in nature: and as to human laws, whatsoever can shackle the affections of the mind when those impel us irresistibly, let us remember this truth—" that whatever is, is for the best; and promotes imperceptibly either a general or a partial good."

Excellent casuist! Who would have thought that love would have made a man a logician! But the good men who have adopted the maxim on which Mr. Ba—Il lays such a stress, were not aware that an unprincipled villain would have employed it as an instrument of seduction. But nothing is secured from abuse. A depraved heart will lay hold of the purest maxims of philosophy, and prostitute to the purposes of licenticus-ness the very grace of the Gospel. The position—that "whatever is, is right," Mr. Ba—Il turns to the worst account. He applies it by way of palliative to ease the sores of Mrs. Thomson's conscience.—Mrs. Thomson's conscience!! Yes, verily, for

it seems, even she had some qualms!

The discovery of these letters produced a separation between the supposed husband and wife: and Mr. Ba--- Il was drawn in, under a presumption of adultery, to sign an instrument by which he bound himself in a penal sum of ten thousand pounds to provide for the maintenance of Sarah Thomson, Wife of Henry Fred. Thomson, for the great love and affection that he bears to the faid Sarah, &c.' By another deed he bound himfelf to the payment of an annuity of 300 l. to Mr. Thomson, for divers good causes and considerations him thereunto moving.' For the Reader should know, that when Thomson found how matters had been conducted by Mr. Ba---ll and the lady, he wisely considered, when the paroxism of his rage began to subside, that as the affair could not be rectified, it would be most prudent to turn it, as much as possible, to his own advantage: and not attempt to litigate in a court what the law could neither confirm to his honour or profit. Mrs. Thomson indeed threatened him into filence, by declaring that she would divulge the nature of their connection, if he perfifted in interrupting her more profitable amour with Mr. Ba---ll. Alarmed by this menace, and in some measure awed by the power and influence of Mr. Ba——II, he refigned the lady, and took the bond as a recompence for the loss.

The sale of what was regarded as a wife, drew on Thomson much and deserved infamy. He was detested and shunned by all persons of character, for condescending to a traffic equally contemptible and wicked. With this odium on his conduct, he made a voyage to China, and from thence returned to Eng-

land in Aug. 1773.

—ll's living in open adultery gave great offence to the Gentlemen of the Council. They reprobated his conduct aloud, and infifted on a reformation of a plan of life fo difgraceful to a person in his high station. Stung by their reproofs, or influenced by some little remains of modesty, he abfented himself, for some time, from the Council: but prudence at length getting the better of passion, he dismissed the object of it, and Mrs. Thomson was sent to England. Before her arrival, our Author had received a letter from Mr. Ba-11, preffing him, in the most earnest terms, to repair immediately to India, to take care of his wife and children, promifing him every protection that friendship could afford. When Thomson arrived in India, he was surprised to find that his wife had failed for Europe some time before: for it seems, the Gentlemen of the Council so far and with such determination interested themfelves in the honour of their body, that they infifted on Mr. Ba——Il's immediate dismission of the woman who had been the occasion of all the obloquy that had been brought on his character, and which in a certain degree affected the honour of the Council. They would not wait for Thomson's return to India. Mr. Ba---ll adopted the most prudent alternative.

While Thomson was in Bengal, he was entertained at Mr. Ba—Il's house. While he continued there, he was very solicitous with Mr. Ba—Il to enter into a fresh bond for the security of the annuity before mentioned. He wanted to have a sund established for the payment of it. After many tedious delays, and many shameful equivocations, Mr. Ba—Il at length produced instructions to his brother for this purpose. The terms specified in these instructions were very satisfactory to our Author; and when he arrived in England, he slattered himself that he should soon see the period of his missortunes. Alas! the greatest were yet to come. He sound that the deed was informal; and that as he was not married, it could not operate in law.

law.

Captain Ba——Il, the brother of Richard, started many objections to the execution of the instructions that were sent to him from India: and on Mr. Thomson's application to Pickering the attorney, he had the consummate mortification of hearing, that before the deeds could be properly drawn up, it would

be necessary a certificate of the marriage should be produced. This was impossible; for the pretence of marriage was an imposition. Mr. Ba——Il himself seemed to have known it at last: and though he seigned an ignorance of the matter to Thomson, yet the latter suspects that he contrived to have him cancel the former deed, and consent to another, that Mr. Ba——Il must have known could not operate in any court.

Our Author was left once more to execrate himself for having been made the dupe of his own folly and another's artifice. He thought indeed of a remedy in the Court of Chancery; but was informed that that Court could not give him the relief he wanted. His last appeal lay to another Court, and he resolved to put himself on the trial of it. He found the Captain deaf to the calls of justice and honour: 'but (says our Author) I resolved to work upon his pride; and I must own that I expected more from that quarter than from any other. Nor was I deceived. I drew up a short state of my case, into which I introduced Mr. Ba---ll's letters to the supposed Mrs. Thomson. I determined to lay it before the Public, and made the Captain acquainted with my intention.'-The family pride (as Thomson expected) was alarmed: a negociation was fet on foot, and he received 1500 l. on condition that he should, on oath, give up all the original letters of Mr. Ba-ll on the subject. complied (fays he) with the terms: but as I did not wish to lose the means of my own justification. I took care to keep attested copies of all the papers I had delivered up. Since that period I have had reason to rejoice at this precaution; for when I attempted to employ the 1500 l. in business, I sound that no one of reputation liked to be concerned with me.' To justify himself to the world, and remove that load of infamy which had long rested on him, to the person who chiesly merited it, is his professed motive in the publication before us. was penning the present narrative, he was, to his great surprise, visited by the very woman who was the author of all his misfortunes. She expressed her forrow for what had passed; and as the only reparation the could make, the offered (fays our Author) to divide with me an annuity of 300 l. which she receives from her paramour; and begged that I would suppress the pamphlet.' Mr. Thomson rejected the offer with contempt; and, notwithstanding his finances were not in the most promising train, he resolved to lay the whole transaction before the Public, and to stand to their award.

For our part, we are in doubt whether Mr. Thomson hath most claim to pity, contempt, or detestation. We have been alternately affected by each in the perusal of the present performance. Old as we are, we have not forgotten what youth is; and, contrary to the example of too many of the same standing

fanding in life; whose severity is frequently the effect of envy, we still find in our bosoms a strong advocate for the sollies and precipitance of youth. We know the power of semale art when seconded by semale beauty, and that appearance of gratitude and simplicity, of which the abandoned part of the sex so dextrously avail themselves, to the delusion and destruction of simple and unwary minds. We pity the victim of semale imposition, and would willingly give him such advice as hath the fairest chance of raising him superior to pity. But to reason with passion, is to go upon the forlorn hope! Experience, which tortures, frequently improves the heart. It realizes the lessons of caution; and we seel what we were warned of.

But though we are so ready to excuse the wild fallies of unguarded youth, and would willingly take the child of missortune beneath our protection, even though that missortune were the effect of a criminal passion; yet when, instead of begetting penitence, it nourishes rancour, and the gayer passions of a sensual taste degenerate into the unrelenting rage of a dark and diabolical spirit, we give to indignation what else would be due to pity; and forgetting the cry of misery, we are only shocked at the howl of revenge.

ART. IX. The Force of Truth; an authentic Narrative. By Thomas Scott, Curate of Weston Underwood and Ravenstone, Bucks. 8vo. 20. unbound. Keith. 1779.

HIS Mr. Scott, if we may give any credit to his own account of himself, hath been a forry fort of a gentleman in his time. Whether he hath overcharged the picture with too much shade, merely for the sake of making a shew of his deep humility and contrition; or whether he hath drawn it according to life, and preserved in the delineation he hath exhibited of his features the force of truth, it is not our business to enquire. We must take the matter as it comes before us: and in this light it appears clearly to us, that Mr. Scott hath been-viz. - as aforefaid!-" Very true (perhaps this gentleman will fay), I join heartily with you in the accusation. I know that I was a proud, obstinate, hypocritical, perjured, blasphemous wretch: but the case is altered now.—I hope you will not dispute the power of Divine grace."—No—we shall not dispute any point with Mr. We cannot combat him on 'his own ground. We can' not get any footing there. As to our ground—he is got above it! But though we do not chuse to dispute, we will affert our claim to the privilege of doubting.

Mr. Scott hath made choice of a motto from Horace,

In campo doceat parenten currere frenis.

That is, in plain English. An als will be an ale, do what ye. Rev. Aug. 1780.

K. Can."

can." And he backs this old Pagan proverb by a Scriptural paradox, viz. "Vain man would be wife, though man be born a wild afs's colt." Now through the greatest part of this 'authentic narrative,' Mr. Scott produceth himself as a striking evidence both of the proverb of Horace and the paradox of Zophar the Naamathite. Mr. Pope produceth Sime's mate, as a match for any als both in point of meekness and obstinacy. But Mr. Scott's obstinacy (if his account of himself be authentic) is naturally so great as to leave no room for a grain of meekness. 'Tis like Aaron's serpent! it swallowed up every other passion and principle of his heart! 'Few persons (says he, p. 152) were ever by nature more self-sufficient and positive in their opinions than I was. Fond to excess of entering into argument, I never failed on these occasions to betray this peculiarity of my character. Seldom did I ever acknowledge or suspect myself mistaken: scarce ever did I drop any argument I had undertaken to support, until either my reasonings or my obstinacy had filenced my opponent. A certain person once said of me, that I was like a stone rolled down the hill, which could nei-This witness was true.—Indeed I ther be stopped nor turned. carried the same obstinate, positive temper into my religious inquiries: for I never gave up one tittle of my sentiments till I could defend them no longer; nor ever submitted to conviction till I could make no longer refistance. The strong man, armed with my natural pride and obstinacy, and having with my vain imaginations and reasonings, and high thoughts, builded himself many strong holds, kept his castle in my heart; and thus garrisoned, when the stronger than he came against him, he stood a long siege.'

If the honesty of a man were in proportion to the freeness of his confession, Mr. Scott might have some considerable pretensions to that character. And so would the celebrated infidel Cardanus—who, in the delineation of his disposition and character, hath thrown some of those sombre tints on it that shade so large a part of Mr. Scott's portrait. " Nugacem (says Cardan of himself-somewhat in the style of Mr. Scott) religionis contemptorem, invidum, triftem, suorum osorem, inamænum, austerum; sponte etiam divinantem, maledicum, varium, ancipitem, impurum," &c. &c. &c. Now, if confession be a proof of fincerity, the Atheist and the Methodist have equal cause for boasting of their great proficiency in the practice of this virtue. They differ indeed as to the cause of their turpitude: Cardan charging his to the account of his flars; and Mr. Scott laying all the blame of his, on a depraved nature—on original fin—the well-spring and fruitful root of all these multiplied evils (p. 97). The evils of Mr. Scott's nature, depraved as it might be by original fin, were indeed multiplied and aggravated to a very great

great degree, if what he tells us of himself in pages 13, 14 and 15 be authentic. I was filled with a self-important opinion of my own worth, and the depth of my understanding. I had adopted a system of religion accommodated to that soolish pride, having almost wholly discarded mysteries from my creed, and regarding, with sovereign contempt, those who believed them. As far as I understand these controversies, I was nearly a Socinian, and a Pelagian, and wholly an Arminian. Yet to my shame be it spoken, I sought to obtain admission into the miniastry in a church whose doctrines are diametrically opposite to all the three; without once concerning myself about those barriers, which the wissom of our foresathers have placed about her, purposely to prevent the intrusion of such dangerous heretics as I then was.

When I was preparing for this solemn office, I lived as before, in known sin and in utter neglect of prayer.—And thus, after some difficulty, I continued with a heart sull of pride and wickedness: my life being polluted with many unrepented, unforsaken sins, without one cry for mercy, one prayer for direction or affistance in, or blessing upon, what I was about to do. After having concealed my sentiments under the masque of general expressions; after having subscribed to articles directly contrary to my then belief; and after having blasphemously declared in the presence of God and the congregation in the most solemn manner, sealing it with the Lord's supper, that I judged myself to be inwardly moved by the Holy Ghost to take this office upon me (not knowing, or not believing, that there was a Holy Ghost), on Sept. 20, 1772, I was ordained a Deacon.

Mr. Scott indeed foundly berates himself for this daring wickedness—calling himself all manner of names for it—such as—'a rebel, a blasphemer, an irreverent trisler with his God—a presumptuous intruder into his sacred ministry:'—and whenever he thinks of it, he is filled with amazement that he is out of hell.'

Now what, good Reader, was the ruling object of Mr. Scott's heart when he thus, like another "Ananias, lied to the Holy Ghost?" He answers the question himself. 'A proud conceit of my abilities, and a vain-glorious imagination that I should some time distinguish and advance myself in the literary world.'

Though the imposition of right reverend hands could not conquer Mr. Scott's unbelief in the Holy Ghost, yet Mr. Venn's Essay on the Prophecy of Zacharias' brought about a strange and almost miraculous revolution in his faith, and put the point before doubted of out of all dispute. I should (says Mr. Scott) as easily be convinced that there were no Holy Ghost, as that he was not present with my soul when I read what Mr. Venn had written on that subject. And yet, in the midst of these divine

illapses of the Spirit, Mr Scott was an inveterate Arian—a despiser of the doctrine of the Trinity, and had quarrelled (as he informs us) with the Articles of the Church of England about this doctrine. At length, however, he began to fuspect the truth of Dr. Clarke's hypothesis;—and in time (for matters were in a train to complete his orthodoxy) he was conftrained to renounce his former sentiments, as utterly indefensible.

Still, however, something was lacking! 'His prejudices against Mr. Hervey upon doctrinal subjects were very strong' But, providentially, about July 1777, Theron and Aspasio sell into his hands.' All was very wonderful!—but 'especially (says our Narrator) his animated description and application of the stag-chace cleared up the important matter [viz. of Justification] to my before-darkened apprehension, more than every thing I had hitherto read upon the subject.'

All now was as it should be, except in the matter of 'personal election.' 'This was (as he says, very pathetically) soolishness unto me!' But as Mr. Scott was born to be a thorough Calvinist in the end, predestination, and its whole train, sell into his creed in due order; and 'now (says he exultingly) I willingly submit to be considered by the world under the mortisying character of a silly, half-witted, crack-brained enthusiast.'

THOUGH we have somewhat abridged this prosufe titlepage, it hath still much the air and appearance of spiritual
quackery: and we think the book itself not wholly void of that
oftentatious diction which empirics are always fond of; but
which the humble Christian would consider as very unsuitable
to the nature of prayer. Witness the following expression—
The intellectual powers we are possessed of, the use of our
reason, and our capability of knowing and enjoying God, are
among the best of our mercies, for which we adore, and laud,
and magnify thy venerable name.

What

ART. X. The New Universal Prayer-Book, or, Complete System of Family Devotions, designed for the Use of Protestants of all Denominations, containing Forms of Prayer for every Morning and Evening in the Week, with suitable Meditations and Resections; also particular Prayers and Thanksgivings for every Occasion and Circumstance in Life. Likewise a practical Discourse on the Christian Sabbath: and devout Meditations on the Lord's Supper, with Prayers to be used before and after the Participation of that holy Ordinance: including an Introduction recommending the Practice of Family Worship and Social Religion. By the Rev. Jos. Worthington, LL. D. late of Queen's College, Cambridge. 8vo. 3s. bound. Hogg. 1779.

What a swell of language concludes Dr. Worthington's paraphrale on the Lord's prayer! All power is derived from thee, as the Source of all existence, and all the glory must return into thy hands at that grand revolution of things—that awful crifis, when a period shall be put to time itself with all its eventswhen the earth shall be dissolved, the elements melt with fervent heat, and all visible nature be destroyed—when the number of thine elect is finally accomplished and lodged in the heavenly granary-when all the bleffed purposes of providence and of grace have received their completion—then shall the Son also himself deliver up the mediatorial kingdom into thine hands, that God -the Triune God, may be all in all-then shall it be the unceasing and never-ending employment of angels, arch-angels, cherubim and seraphim, spirits who kept their first estate, and all the company of the redeemed, clothed in white raiment, and having palms of eternal victory in their hands—then they will all unite in one univerfal chorus—evermore praising thee.'

But our Author doth not always foar on flaming pinions

he frequently finks into a very mournful whine of confession: and in one of those lamentable humours, he thanks 'the divine and adorable Majesty of the incarnate Word, that when no eye pitied us, yet that the bowels of his compassion yearned in our behalf—commiserated our case, and came down to our help.'

The Puritan divines of the last age were fond of introducing mystical allusions and metaphors, from the Old Testament, into their prayers:—the greatest part of which being of a local nature, must have been persectly unintelligible to the common people. Nevertheless, from their sound, more than the sense they conveyed to the understanding, the people grew very fond of those obscure phrases: and a prayer, formed on the simple model delivered to us by our Lord, was deemed to be inspired and spiritless.—A popular divine never failed to raise a sigh, or excite a groan, when he introduced the following text into the train of his confessions, "May our mourning be like the mourning of Hadradrimmon in the valley of Megiddon!"—No matter who Hadradrimmon was, or where the valley of Megiddon was situated, or what the mourning was about; there was something doleful in the sound: and that was enough.

The lively passions were equally with the sorrowful ones under the control of a magical text, artfully introduced at the proper moment. The following, from the Canticles, hath performed wonders in that way; <sup>66</sup> Or ever I was aware, my soul made me like the chariots of Aminadab."

Dr. Worthington talks in his prayer of 'fetting up his Ebenezer;' and speaks highly of the efficacy of 'the balm of Gilead, and of the physician there.'

Such expressions are, in our opinion, wholly improper for social worship. They convey no meaning, or a wrong one, to weak minds. The language of prayer ought to be as clear and simple as possible—divested of all mystical allusions—all metaphors and sigures of speech—all pompous, complimentary phrases—as well as gross and vulgar epithets, or trite and familiar terms. Social worship should be consined as much as possible to general principles of religion, and the common duties of moral and Christian practice. Controversy should be kept aloof from this sacrifice of mutual love to our common parent: and the preacher who introduceth his own speculations into his public prayers, must be very ignorant, or very presuming, or, what is worse, a dupe, for interest's sake, to the prejudices of others, who will have a prayer as well as a fermon, Calvinism all over!

Dr. Worthington may think himself slighted, if we do not produce specimens of his meditating as well as his praying gifts and graces. In his Good-Friday meditation, he ponders in this wise with himself on the passion of our Lord. 'In the Gethsemane he must likewise experience the out-pourings of his father's wrath in our place and stead. Here it was that his righteous foul became exceeding forrowful, even unto death. Here it was that the spotless victim began to feel the dreadful weight of imputed guilt and the terrors of avenging justice—when his inward agony forced his blood from his veins through his threefold vefture—when himself lay prostrate on the earth with his garments literally rolled in blood—when, as the furety of the covenant and a substitute for his people, he actually bore the fins and carried the forrows of the whole world; and with the names of every true Israelite on his heart, our great High-priest, Jesus, the Son and Lamb of God, sustained that punishment for sin which must otherwise have been levied on sinners to all eternity.

So much for our Meditant at the bottom of the mount: let us, before we take our final leave of him, attend him to the top, when he swells into rapture, and dances in allegory, 'And now the great High-priest, Jesus Christ, the Son of God, and God the Son, is for passing into the heavens, to be glorified himself with that glory which he had with the Father before the world began. When Elijah was taken up into heaven by the ministry of Seraphs, sublimely stiled a chariot and horses of fire, the ascending prophet dropped his mantle on the plaintive Elisha below, with which Elisha smote the waters of Jordan, so that they parted hither and thither and Elisha went over-so the ascending Saviour entailed his bleffing, and, as it were, bequeathed his mantle to the children he left behind, wherewith they are able to smite the waters of affliction and temptation, nay of death itself, which shall cleave in twain like a scroll that is rolled back, and leave a way for the ransomed of the Lord to pass over.' W٥

We had nearly forgotten to inform our Readers, that Dr. Worthington's 'Exercises of devotion are laid at the feet' of Dr. Horne, Vice-Chancellor of the University of Oxford, whose 'patronage is implored' in the most humble strain: and whose labours are complimented in the most exalted stile of panegyric. Such exercises indeed may suit the orthodoxy of Dr. Horne; but his ingenuity required a better sacrifice.

A.T. XI. The Georgics of Virgil, translated into English Blank Verse. By William M.lls. 4to. 6s. Boards. Robson, &cc. 1780.

HE principles of poetic translation being so well known and understood, we the more wonder that a Writer who appears to possess some portion of taste as well as learning, should so far mistake his own powers as to attempt a translation of a poem that has ever been considered as the master-piece of one of the first poets that any age or nation has produced; a poem which exhibits the happiest combination of judgment and enthusiasm. The translation, as far as we have compared it with the original, is sufficiently faithful and close; but closeness and sidelity are but parts of a translator's province. Unless some portion of the original spirit be transsused into the copy, it must of necessity be vapid and uninteresting. How far Mr. Mills's translation falls under this predicament, will appear by comparing any part of it with the corresponding passage in the original.

Me may the Muses I to all prefer, Whose facred priest I am, smit with the love Of poefy divine, receive, and teach The ways of heav'n and number of the stars; The different eclipses of the fun, And all the labours of the changing moon; What is the cause of earthquakes, by what force Swell the deep waters of the ocean's tide Bursting their bounds, and then subside again: With so much haste why winter suns decline, Or what retards th' approach of summer nights. But if about my heart the languid blood Too flowly flow, forbidding me to reach Nature's sublimer parts, may rural scenes And purling brooks in fertile vallies please, Streams may I love and woods inglorious. Where are the fields? Oh where is Sperchius, And mount Taygeta, where Spartan virgina Perform'd their frantic Bacchanalian rites? Who will convey me to the pleasing vales Of Hemus cool, and with the mighty shade Of spreading branches cover me from heat?

How unanimated and profaic! how little is the refemblance between this and the genuine raptures of the Mantuan bard!

M

1.,

Me vero primum dulces ante omnia Mulz, Quarum sacra sero ingenti perculsus amore, Accipiant; cœlique vias et sidera monstrent, Defectus solis varios lunæque labores: Unde tremor terris: quâ vi maria alta tumescant Obicibus ruptis, rursusque in seipsa residant: Quid tantum oceano properent se tingere soles Hyberni: vel quæ tardis mora noctibus obilet; Sin, has ne possim naturæ accedere partes, Frigidus obstiterit circum præcordia sanguis; Rura mihi, et rigui placeant in vallibus amnes, Flumina amem sylvasque inglorius. O ubi campi, Sperchiusque, et virginibus Bacchata Lacænis Taygeta! O qui me gelidis in vallibus Hæmi Sistar, et ingenti ramorum protegat umbra!

ART. I. DECHERCHES sur les Causes des Affections Hypocondriaques, appellées communement Vapeurs, &c. i. c. Inquiries concerning the Causes of those Hypocondriacal Complaints, generally known by the Name of Vapours; or, Letters of a Physician concerning these Complaints: - To which is added, A fournal of the State of the Body, relative to the Perfection of Perspiration and the Temperature of the Air. By CLAUDE REVILLON, M. D. Member of the Academy of Sciences of Dijon. 8vo. Paris. 1779.—There are two circumstances adapted to preposses a judicious Reader in favour of this work, even before he is entirely acquainted with its contents. The first is, that the Author adopts, with respect to the disorder in question, the maxim of Montanus, Avoid physicians and medicines, and you will be cured; and the fecond is, that M. REVILLON, himself, was, during fifteen years, severely visited with a nervous disorder, of which he discovered both the principle and the cure. We must, however, observe, that our Author is not so injudicious as to carry the maxim of Montanus too far. He recommends certain remedies to strengthen the stomach; but a proper diet and regimen are the great objects on which he places his chief dependence for the recovery of his patients.—He considers the suppression or diminution of insensible perspiration, as the immediate and efficient cause of hypocondriacal and hysterical disorders, whatever circumstances, of a more remote kind and influence, may have contributed to bring them on : he shews, by a number of curious experiments, made on himfelf and others, that, in order to keep the body in a right state, the matter exhaled by insensible perspiration

. با

perspiration must be more than equal to all the other sensible evacuations by stool, sweat, &c. More especially he observes, that the matter of this kind of perspiration, when suppressed and retained within the body, is carried to different parts, where it occasions obstructions, and affecting chiefly the organs of digestion, produces statulencies, cholics, head-achs, diarrhoeas, or constipation, while the gross, viscous and acrimonious juices, that arise from vitiated digestions, re-act upon the cause that produced them, contracting and closing the pores through which insensible perspiration must be performed.

Having determined the cause, our Author proceeds to the method of cure, which has succeeded on himself, and which deserves attention. For this method, and the curious journal of the state of his body, which the Author kept during ten weeks, we must refer the Reader to the work itself, in which he will meet with some fanciful things, but on the whole, will find, if we are not mistaken, judicious directions, and useful

instruction.

II. Table Analytique et Raisonnée des Matieres contenues dans les XXXIII Volumes en Folio du Dictionnaire des Sciences, des Arts, et des Metiers, & dans son Supplement.-i. e. An Analytical and Philosophical Table of the Matters contained in the XXXIII Folio Volumes and the Supplement of the Dictionary of Sciences, Arts, and Trades, &c. Volume I. Folio, 944 Pages. Paris. 1779. Much has been said for and against the samous Encyclopedie of Paris. The undertaking was certainly great and arduous, and its Authors would have had an undoubted right to the encouragement and applause of the Public, had they not usurped a kind of despotism in the republic of letters, introduced a spirit of cabal and faction into the temple of Science, and attempted alternately to affail and undermine those truths that are the great support of society and morals, and which even the authority of human government should render respectable, to those who are so unhappy as to look no higher. With all its faults, however, the Encyclopedie is a valuable work; it contains a great treasure of knowledge; but it often embarrasses instead of enlightening uninstructed readers. Such frequently stand in need of a guide to connect the scattered branches, that belong to one general article, to conduct them without perplexity from one place to another, where the points of communication are wanting, and above all, to enable them to keep clear of the contradictions which are to be found in several articles of that great work, that relate to one and the same subject. It is proposed to remedy these inconveniencies in the work before us, which may be confidered as an excellent philosophical abridgment of the Encyclopedie; the contents of that celebrated dictionary being reduced to an uniform and confishent system of universal science.

ו/נ ואר

The laborious Author \* has in this Table incorporated the Supplements with the work in the proper places;—he has connected the volumes of Plates with those of the Discourses + much better than they are connected in the work itself:—he has fometimes substituted vulgar denominations in the place of technical terms, added new articles from materials scattered in the original work, and placed together the articles that have such a mutual affinity, as to illustrate each other. He has analyzed several of the philosophical and metaphysical articles, (which are of an enormous length) in such a manner, as to give the Reader a general view of the subject, to present to him a notion of the concatenation of the principal ideas that are unfolded in the text, and to put him in a way of finding, with facility, any thought, fact, or particular observation that he is defirous of recollecting. The transpositions, which were inewitable in the original work, from the impossibility of placing under each word, every thing that related to it, are attended with inconveniencies, which our Author has remedied, not only by indicating often under a fingle word, all that is to be found in the different volumes, relative to it, but also by references, both to the Encyclopedie and his Table, which furnish the Reader with a compendious method of fatisfying his curiofity. The contradictions of the famous dictionary are here also drawn together, and make a curious figure in the part they occupy of our Author's Analytical Table. At the head of this work (which may be of the greatest utility to those who have purchased the Encyclopedie, and which may, in some measure, supply its place to those who have not) we find a Genealogical Table of the Sciences, and another of the Arts and Trades, that are treated in the great work and its supplements.

of the Composition du Remede de M. DARAN—i. e. An Account of the Composition of the Remedy, successfully employed by M. DARAN, Counsellor and Surgeon to the King of France, during the Space of Fifty Years, for the Cure of Suppression of Urine, and the Removal of the Causes that give rise to that Disorder—Published by himself.—To this Work is presized a Presace, containing the Reasons why it was published no sooner, and why it is published now; also a Discourse concerning the Theory of the Disorders of the Urethra, the Proofs that ascertain the Efficacy of the Remedy, and the Methods

This Author is M. MOUCHON, Minister of the French church at Basil, who has employed eight years in analyzing and combining the contents of 33 solio volumes.

<sup>†</sup> Our Author calls the articles of the Encyclopedie, Discourses; such indeed they are; they are even pieces of eloquence, and so far they depart from the plain and didactic tone, that belongs to a dictionary.

by which the Persons afflicted with the Disorder in question, may be acquainted with its Nature and Symptoms. 12mo. Paris. 1779. 360 Pages-Price 2 Livres in Sheets. - It is a great recommendation of the book, ushered into the world under this clumfy title, that its Author, in the course of his practice, completely cured near fix thousand persons of disorders in the urethra; and it is an unquestionable mark of generosity and humane publicspirit in M. DARAN, that while his fortune has been hurt by an unexpected incident, and his advanced age exposes him to the infirmities which generally attend that period, he has published his secret, without an eye to any recompence except the pleasure of doing good. It is well known, that this remedy, as to its outward form, consists of bougies, i. c. something like small waxen tapers. In order to understand their composition thoroughly; it is necessary not only to know their ingredients, but also to peruse the observations that accompany them, and the preliminary discourse on the disorders of the urethra, which takes up two-thirds of the volume before us: we therefore refer the Reader to the work itself, at the end of which there is a respectable list of testimonies in favour of the efficacy of M. D.A. RAN's remedy.

IV. L'Action du Feu Central banni de lu Surface du Globe, &c .i. e. The Action of the Central Fire banished from the Surface of the Globe, and the Sun re-instated in his Rights and Prerogatives, in Opposition to the Assertions of Messers. Buston, Bailly, de Mairan, &c. By M. R. D. L. Member of several Academies. 8vo. pp. 84 (Price 1 Livre 16 Sous). Paris. 1779.—The initial lettters denote M. Rome' DE LISLE, who is the Author of this sensible and spirited piece. By its title it seems to announce a flaming and furious attack on the three celebrated philosophers, who have perhaps exaggerated in their works the action of the central fire; but M. De Lisle encounters these enemies of the Sun with modesty and politeness: we even think. that there is more temper than evidence in several parts of his work. He is perhaps as much mistaken in attributing too little influence to the central fire, as his adversaries are in giving it They both appeal to the thermometer, and this oracle seems to pronounce (though in different places) in favour of them both: but the decisions of this oracle are not always infallible. M. Darcet, Professor of Chymistry in the Royal College, relates, that on one of the Pyrenean mountains, on the fide of Bagnéres, he observed, in the month of June, that the liquor of a thermometer, which was placed at the top of a fixed pole, role to 22 degrees above the freezing point, while he was so affected with the bitter cold, on that mountain (though sheltered, by one still higher, from the north wind),

that neither he nor his companion could bear it above half an hour.—So much for the infallibility of the thermometer.

GERMÁNY.

V. Pyrometrie oder vom maasse des Feuers und der Waerme, &c .- i. e. A Treatife concerning PYROMETRY, or of the Method of measuring Fire and Heat. By the late M. LAMBERT lin. 4to. 359 Pages, with Plates.—The learned Author of this Work was one of the principal ornaments of the Academy of Berlin, and his reputation is sufficient to preposses the Public in favour of this, his last, production, which was finished but a few months before his death. It is divided into eight The First treats of fire and heat in general, of what we call heat in confequence of fenfation and experience, and of the terms by which the Greeks expressed the phenomena of fire. The Second, of the rarefaction caused by heat,—of the thermometers of Drebbet and of Florence—and of the laws of the condensation of the air, according to Sutzer, Muller, and Mariotte. -The Third, of the heating and cooling of bodies. - The Fourth, of the motion of heat, of its expansion, repercussion, and exaltation.—The Fifth, of the power of heat to unite or join, and to disunite bodies, as also of susion. The Sixth contains observations relative to the measure of the force of heat, and of the quantity of the particles of fire. The Seventh treats of the fenfation of heat; and the Eighth, of the heat of the sun.

VI. Fundamenta Geographiæ et Hydrographiæ ad Naturæ Ductum posita. A Joan. Guil. Bauer. 8vo. with five Plates. Giessen. 1779. This piece of subterraneous geography contains a description of the interior and exterior structure and formation of our globe, with observations and remarks of a practical and useful kind. The articles relative to instammable matter, and earth-coal, are both curious and instructive. The subterraneous hydrography is comprehended in several differtations concerning the origin, motion, and constituent parts of spring water, rain water, sea water—of those waters that are saline, acidulous, bitter, &c. together with circumstantial details relative to springs and sountains in England, France, Italy, Sicily, Switzerland, Germany, Bohemia, Silesia, Hungary, Croatia, Bulgaria, Greece, Asia, Africa, and America.

VII. Grundliche, &c.—i. e. A Philosophical Defence of the new Observations of the Satellites of the Fixed Stars, made in the Electoral Observatory at Manheim by M. CHRISTIAN MAYER, Ecclefiastical Counsellor and Astronomer to the Elector Palatine, and Ordinary Professor of Astronomy in the University of Heidelberg, &c. 8vo. Manheim. 1779. This controversial work contains a refutation of the remarks, which the Abbé Hell, of Vienna, published some time ago, relative to the discontroversial.

very of M. MAYER. The latter affirms, that there is not in the Southern Hemisphere, perhaps, one fixed star of a certain magnitude, which is not accompanied with one or more stars of a smaller size. M. MAYER was affisted, in this discovery, by astronomical instruments carried to a very high degree of perfection, and more especially by an achromatic telescope, which is the only one of its kind in Europe, or, at least, was so when he made his observations.

VIII. Nova Species Quadrupedum, e Glirium Ordine, cum Illustrationibus variis complurium ex Ordine Animalium.—i. e. A New Species of Quadrupeds of the Class of the Glis, together with several Illustrations relative to Animals of that Class. By M. P. S. PALLAS. Part I. Erlang. 1779.—'This first part, or bundle (as it is called, fasciculus), of the celebrated M. Pallas, relates to the class of hares, of which he describes five kinds hitherto unknown. M. PALLAS's design was to communicate to M. Schreber the observations he might have occasion to make in his travels, in order to affish the latter in completing his history of that class of animals that are provided with paps. But M. Schreber sound these materials too rich and abundant, to melt them down into his work: he has therefore published them separately, and they are, indeed, worthy of the attention of connoisseurs in natural history.

IX. Acta Ofnabrugensa, &c.—i. e. Memoirs relative to the Jurisprudence, Government, and History of Westphalia, and more especially of the Bishopric of Osnabrug. 8vo. Osnabrug. 1779. First Part.—These Memoirs are intended to convey an accurate account of the civil and ecclesiastical state of Westphalia, of its various governments and jurisdictions, of its laws, revenues, revolutions, cities, cloisters, families, &c.—The Editor, M. Lodtmann, has published, in this volume, a memorial relative to the bishopric and principality of Osnabrug, its bishops, its imperial privileges and constitution, as also an ancient register of its seudal tenures and vassals, and the beginning of a topographical description of that bishopric, whose population, according to an accurate list, amounted, in the year 1772, to 116,664 souls.

X. Ferbers, Neue Beytrage zur Mineralgeschichte verschiedner Lander, &c.—i. c. New Additions to the Mineralogical History of several Countries: Part I which contains also an Account of several chymical Elaboratories. By M. Ferber. &vo. Mittau. 1779. M. Ferber's labours in natural history and mineralogy have been formerly mentioned by us with the high esteem they so justly deserve. The first thing we meet with in these interesting additions, is a series of observations relative to the mineralogical history of Bohemia. This is followed by an account of some extinguished volcanos, and of the method in which

porphyr

porphyry is formed. After some observations on the mountains of Saxony, M. FERBER treats of chymical laboratories, such as those of England, in which oil of green vitriol, the vitriolic acid of Sulphur, aqua regalis, and Spirit of Salt are distilled,in which flower of sulphur, cinnabar, corrosive sublimate, and sweet mercury are sublimated, and camphor is refined,—those of Montpellier, where verdegrise is prepared, &c.

Art. 13. Le Destin de l'Amerique, &c. The Fate of America; or, Picturesque Dialogues, unfolding the Cause of late Events, the Policy, Interests, Resources, of the Powers of Europe, confidered in Relation to the present War; and the Effects which this War is likely to produce on the Happiness of Mankind. 8vo. 124 pp. London +.

HE principal personages introduced in these Dialogues are, the K. G-B--, Lord North, Lord Weymouth; the Duke of Richmond, Lord G. Germaine Lords Bute, Sandwich, and Shelburne; the Ministers of France, Russia, and Holland; a Projector and a Philosopher.

This work is by no means destitute of merit, in point either of information or of composition. We meet with some forry jokes, and a few weak passages; but in general, the characters are well supported, the language is accurate and perspicuous, and the obser-

vations are just and important.

The main scope of the reasoning is to prove, that Great Britain has little friendship to expect from the Dutch, or from any European power. That there is small prospect of her conquering America by her own internal strength. But that should this be effected, the acquisition would not be worth the price. That it is the interest of Great Britain, as well as of humanity, to declare the Thirteen Provinces independent; to enable the fouthern Continent to throw off the yoke of Spain; to give liberty to all the islands French, Spanish, and English; to declare herself the patroness of general freedom, universal toleration, and unrestrained commerce. Britain would then become the idol of nations; and acquire by her moderation a voluntary empire over the minds of men, far more beneficial, more honourable, and more lasting, than any that can be obtained by arms. Art. 14. An Inquiry into the legal Mode of suppressing Riots; with a Constitutional Plan of future Defence. 8vo. 1s. Dilly.

It is impossible to say too much in praise of this concise Inquiry. It bespeaks the hand of a master, deep in legal knowledge, and the

+ William Jones logo famous in Oriental Literature

<sup>+</sup> So says the title page; but we are informed, that this tract was printed in Brabant, and that its circulation has been extensive. beart

heart of a citizen truly virtuous. Within the compass of a few pages, it makes every reader a lawyer upon the question under discussion; and it points out the means of preserving public peace and freedom with so much clearness, that it is not possible, as we conceive, for any reader to doubt of their efficiency, or to see any discussion ficulty in carrying them into practice.

Art. 15. A Plan of Association, on Constitutional Principles, for the Parishes, Tythings, and Counties, of Great Britain, &c. In Three Letters to a Member of Parliament. 8vo. 1s. 6d.

Kearfly. 1780.

In affiguing the general cause of the late tumults and outrages, the Writer sets out with informing us,—' That the administration of government in England, for many years, has been misemployed, and its attention directed to distant and unimportant objects; while those provisions, customs, institutions, and laws, which our ancestors had left for our security, and which are sometimes called the constitution, have been suffered to languish and die.'

His plan is to restore to its ancient vigour, the power of the counties, hundreds, and tithings, by arming the inhabitants, and reviving the decayed authority of the civil officers; viz. the Tithingman, the Sheriff, and the Earl of every county. By these means, he presumes, that disturbances, riots, and infurrections, will ever be instantly and effectually suppressed, or rather totally prevented.

Provided every citizen of London had been, what the conflitution of England, not only allows, but requires every man to be, in a condition to defend himself and his family, and accustomed to appear upon a call of his ward by the magistrate, he asks, 'Will it be imagined, that any of the mischies which followed the Protestant

Affociation would have taken place?'

He then shews the illegality and the inexpediency of employing a standing mercenary army in support of the civil power; and answers the late speech of Lord Mansseld in the House of Peers, by a sormer speech made by him when Mr. Murray, at a time that he thought it 'a libel on the government, to suppose the civil magistrate not strong enough.' This essay ranks not in the highest class of political tracts, but it is, in general, well calculated to promote the cause of public peace and freedom.—We must remark, however, that the author seems to bear too hard on the Protestant Association, whose views do not appear to deserve the epithet of 'villainous, which he has bestowed on them.

Art. 16. Reasons for Uniformity in the State. Being a Supplement to the Britannic Confliction, by Roger Acherly, Esq; late of the Inner Temple. 8vo. 1s. Bew. 1780.

The plan laid down in this pamphlet, is the same which has lately been adopted by Lord Abingdon, in his dedication to the people

England: See Review for May.

The defign of this supplement, says the Writer, sis to unite the two contending parties, of Whigs and Tories, in the true notions of the constitution of the British kingdom and government, as the only expedient to pull up by the roots all seditions, tumults, treasonable conspiracies, rebellions, and even party distinctions, except that one, viz. of those who are for the British constitution, and

D.

those who are against it, being a distinction that ought to be perpetual: which desirable end can never be effected, without an act

for uniformity.'

If an act for uniformity could really effect all this, how easily might our grievances be removed! But, alas! such an act, we fear, is never likely to take place, at least, while they, whose fortunes and consequence are built upon the irregularities and uncertainty of the constitution, can prevent it.

Art. 17. An Address to the Honourable Admiral Augustus Keppel.
Containing Candid Remarks on his Defence before the Court
Martial; to which are added, Impartial Observations on the late
Trial and Acquittal of Vice-Admiral Sir Hagh Palliser, with an
Explanation of Sea-phrases, and a Letter to the Monthly Reviewers. By a Seaman. The Third Edition. To which is
added, A Supplement, containing the Substance of Eight Letters
to the Right Hon. the Earl of Sandwich, Two to Sir Joseph
Mawbey, and Three to Admiral Pigot; with a concluding
Letter, addressed to the Right Hon. the Earl of Sandwich. 8vo.

3 s. Nicoll. 1780.

The first edition of this work was announced in our Review for April 1779; of the second, in which was included the Author's letter to so, we took notice in our number for the month of August following; and we now mention the third edition on account of the supplement: in which the acute writer renews his attack on Admiral Keppel; continues his desence of Sir Hugh Palliser; and en passant, condemns Lord Howe, and the opposition-party in general. He concludes, with advising administration to 'entrust the execution of their schemes to those only who approve them; to reward merit, punish delinquency, exterminate that party spirit which has alarmingly pervaded our sects and armies, and restore discipline to its wonted force.' We have already given our opinion of this Writer's merit.

Art. 18. A Differtation on the Political Abilities of the Earl of Abingdon, &c. &c. By a Gentleman of the Inner-Temple. 8vo.

15. 6d. Fielding and Co. 1780.

This Gentleman of the Temple treats Lord Abingdon in a very ungentle manner. He is, himself, not an elegant writer, and he charges the Earl not only with holding bid [political] principles, but with using bad English in his publications. He roundly pronounces the noble politician's 'Thoughts on Mr. Burke's Letter to the Sheriffs of Bristol', a compound of scurrility, incorrectues, and political indigestion. This reminds us of an ill-savoured sop, a man of sashion, who had a footman whose countenance was not much more amiable than his own. The gentleman, who was fond of his own person, could only see deformity in others, and he always saw it with disgust. It happened, one day, that being unusually offended with his man, while he was dressing him, he exclaimed, 'What an agly dog!'—Which of us is your bonour looking at? said the fellow, drily,—observing, that his master was, all the time, attentive to the piec-glass.

<sup>\*</sup> See Review, vol. Ivii. p. 249.

Art. 19. Letter to the People of Laurencekirk, on occasion of presenting the King's Charter, by which that Village is erected into a Free and Independent Burgh of Barony. To which are subjoined, an Abridgment of Two Letters published by Sir Richard Cox, giving an Account of the Establishment and Progress of Industry in his Village near Cork in Ireland; -the Guardian, No 9 .- and the Clause of Erection of Laurencekirk into a Burgh of Barony. Edinburgh printed, and published for the Benefit of the Village. 8vo. 1 s. 6 d. Longman.

Laurencekirk is, we understand, a new village, settled by Beancis Garden, somewhere in Scotland; but the public are neither. informed whereabout, in that kingdom, Laurencekirk is to be found, nor of any circumstances of its establishment: this letter. confisting only of general wholfome recommendations of industry and frugality, to the members of the rifing fettlement. The attributes of fredom and independence bestowed on a new burgh, did not fail of producing a smile, when we restected on the state of our old English burghs; the representation of which is regularly sold and transferred by formal contracts, as if the free and independent electors were so many herds of cattle! But this inclination to risibility was fomewhat abated, by the following information, given by the benevolent Letter-writer to his new burghers: viz. By your conflitusion, as a free and independent burgh of barony, you enjoy the useful and desirable power of electing, from time to time, your own magistrates: and they have a jurisdiction sufficient for the purposes of justice, peace, and good order, within your own territory. You have indeed no political capacity or title to share in the election of our representatives in parliament; this is the privilege of royal boroughs, and in my opinion, the fingle right they have which is not implied in the election of an independent burgh of barony. In truth, this is a privilege not to be envied. It certainly is too often the fource of diforders, and destructive corruption of manners among the people, especially of our smaller burghs: and experience, the best guide to truth, proves, that our communities thrive best without it; for in general, those communities, both in England and Scotland, which are from small beginnings in the best train of advancement in useful arts and consequential prosperity, are endowed with

ducive to the first introduction of arts.'

It is extremely natural to inquire what we are to think of our political circumstances, when a body of the people are congratulated on not existing what we are taught to esteem as the most valuable privilege under the English constitution?

no such political capacity;—and have no exclusive incorporation, which has been another baneful obstacle to the progress of industry, though originally intended as an encouragement, and perhaps con-

Art. 20. The Out-of-door Parliament. By a Gentleman of the Middle Peniple. 8vo. 1s. 6 d. Almon. 1780.

An animated vindication of the rights of the people of England, concluding with a judicious recommendation of a proportional representation in parliament, and annual elections, as the proper cure of our state distampers.

Rav. Aug. 1780.

L

This

This effay seems to be the production of a young writer, whose flyle is far from chaste, and whose diction is sometimes obscure.

Art. 21. Observations on the Opinion of Mr. George Rous, late-

ly delivered in the House of Commons, That the Crown can give Independence to America, without the Assent of Parliament.

Svo. 1's. Kearfly.

A feeble comment on an able performance. Both the commentator and his original appear to us to be in an error, in confidering the independence of the American States, as a question upon which Great Britain ought to decide from motives, not of justice but of

policy, not of right but of power.

Were the rules of justice to be the rules of judgment, and they should decide the question in favour of those States, the reasoning of both these writers would fall to the ground. Arguments to that effect have been offered to the public, which we do not remember to have seen resuted. All reasonings upon the residence of powers not previously shewn to exist, seems to be unnecessary at least, if not tending to consound and millead the public judgment.

Art. 22. A Letter to the Rev. Dr. Richard Watson, King's Professor of Divinity in the University of Cambridge. 8vo. 1 s.

Cadell. 1780,

This letter-writer professent the highest esteem for the general character of Dr. Watson, and is lavish of his compliments on the great erudition and exalted generosity of the excellent Professor. From our earliest acquaintance (says this Author—who claims the Doctor as his quendam friend at the university) I admired you for your candour, your courage, your integrity, and the openness of your hand and heart. I reverenced that industry and unremitting diligence I could not imitate, and I esteemed the clearness and folidity of your understanding, as a gift God had bestowed on very sew of our species. I observed the superior facility these qualities assorted you in your advancement. I was one of your sew friends who saw your progress with triumph instead of envy, and at this moment I respect and honour you as much as any man living—your political treed only excepted. Hinc ille lactryma!—But indeed the Author is more inclined to laugh than to weep at the Doctor's attack on the solid structure of monarchical polity, and his zeal to erect in its stead some visionary sabric of liberty and independence, on the models of a Locke, a Sydney, and a Harrington.

We think this Writer, notwithstanding the profusion of commendation bestowed on Dr. Watson's abilities, hath but a slight claim to the Doctor's gratitude. 'The Opposition (says he) are assailants: they condemn all present measures; they profess amendment and reform; they deal in calumny, crimination and reproach: and in order to forward these, they must have in the number of their adherents a class of men, whose business it is to sound the alarm,

In vulgum ambiguas,

to unfold matters by degrees; to try the ground before them:—men who are not admitted into the depth and extent of their defigns;—men of as honest hearts as your own, who think they are speaking 6

trath while they are only ferving a purpose, and who really mean liberty while they are promoting a faction. If such he your fituation, "lay your hand upon your heart, and feel whether it throbs with conscious shame or conscious pride."—— 'You deceive your adversaries by your seints, and yourself too, I verily believe: but your friends understand the design persetly; they glory in the management and vigor of your assault [viz on the citadel of influence and corruption], and disseminate your publication with as much assiduity as if it were a Congress Gazette.' What an invision and illiberal to place Dr. Watson! The very man whose clearness and selidity of understanding placed him in the effect of this Author, so, high shove the rest of the human species, is now degraded to the most despicable state of an—honest indeed, but weak and credulous dupe, to be made the tool of artisice and knavery, whenever rebellion needs a hand to disseminate its abborred principles!

This Letter-writer infinuates—nay, he more than infinuates, that it would afford Dr. Watson, and the party that employ him, the height of joy and exultation, to see the constitution overthrown, the parliament annihilated, and the law extinguished. An ill-natured reflection is also thrown on that truly great statesman Lord Chatham, because he complimented the Americans for the spirit they discovered in resisting the encroachments of ministerial rapine; and hence this writer would infinuate, that he had no love for his country. It is certain, that he never shewed his patriotism in the manner in which some other ministers have exhibited theirs. But we think it was not the less real, because it did not appear with the covering of Lord G. and the Earl of S.

This Letter-writer ridicules Dr. Watson's address to the Deity, at the conclusion of his excellent sermon, by a filly and prophane parody. He also casts a sneer at the language, as well as the sentiments, of this prayer, and would, if possible, make his readers bedieve that it is a specimen of arrant bombast: that sipparacy of slyle, which would suit a pert and captious episse, would ill become a grave discourse, preached before the university by the professor of divinity.

MISCELLANEOUS.

Art. 23. Emphresyne: or, Amusements on the Road of Life.

By the Author of The Spiritual Quixote. Vol. 11. 12mo. 32.

Boards. Dodsley. 1780.

This volume, like the former (see Monthly Review, vol. lv. p. 71.), contains an amusing variety of pieces both serious and comio. Though the best of them will never be confidered as efforts of superior genius, they, nevertheless, display evident marks of good sense and cultivated taste: and even in the more trisling performances (of which there are many) there is a vein of good-humoured levity and cheerfulness, that will prevent the most captious critic from being much offended by them.

Art. 24. Letters of the late Lord Lyttelton. Small 8vo. 3s.

Bew. 1780.

These Letters have been publicly declared spurious; we are forry to add, that they indicate abilities in the writer, whoever he be,

ı

that ought not to have stooped to the contemptible arts of decep-

Art. 25. A Diary, kept in an Excursion to Little Hampton, near Arundel and Brighthelmstone, in 1778; and also, to the latter

Place in 1779. Vol. II. 12mo. 2s. fewed. Bew.

The first volume of this Sentimental Diary was announced in p. 398 of our Review for Nov. 1778. In this continuation, the Author, who professes, that his business is only to trifle, tell stories, and crack jokes, proceeds in the same easy, careless, desultory way—trifling, indeed, very often, repeating old stories new vamped, and cracking such jokes as have probably afforded him more pleafure than he is able to convey to those who are to crack them over

again.

This disciple of Sterne's does not seem to be aware, that it would be as commendable to imitate the good English as the good humour of his master. Sterne would never have condescended to use the vulgar whereoft and wherebys, which we meet with in this rambling Journal; see particularly p. 12 and 13. Neither would he have talked of 'the charming charms of dear variety,' p. 11. Nor could he have told us, that 'there is one dry and two wet wells open' at Brighthelmstone, that are dangerous to children. Such little slips should be rectified in the next edition; and when the Author's correcting hand is in, he should explain what is meant by the bishop of Pontoppidan; of whom we never heard before. We presume, the Gentleman had his eye upon the good bishop of Bergen, in Norway, who wrote a samous Natural History of that country †; and whose name was Pontoppidan.

Art. 26. Thoughts in Profe and Verse, started in his Walks, by John Hope. 8vo. 6s. Bound. Goldsmith. 1780.

The principal part of these essays has already appeared in different periodical publications, in which many of them have been favourably received. This eccentrical writer, whose thoughts seem to be expressed with the same undisguised freedom that they presented themselves to his own mind, has blended with his singularity a confiderable portion of good sense. Though many of the pieces in this volumes will no doubt be thought trivial and uninteresting, yet there are scarcely any in which the reader will not meet with something to entertain him. Perhaps, he will be amused with the reason which Mr. Hope assigns for prefixing his name to this collection: 'I did not determine to put my name to this book, until I read in the Parliamentary debates, that, of the thirty-three Scotch members, who were present in the House of Commons, when Mr. Dunning's motion was put to the vote, "That the instructed of the Crown has en-

creafed,

The first volume was entitled "Sentimental Diary;" but the Author has now thought it proper to leave his readers to discover the sentimentality, without the aid of a singer-post. Yet this volume is not (to the best of our recollection) less sentimental than the former; and, in truth, we think, the Writer succeeds more in sentiment than in his attempts at humour.

<sup>+</sup> Of this celebrated history, the Reader will find a copicus abfiract in the 12th vol. of our Review.

creased, is encreasing, and ought to be diminished,"-twenty-eight of them voted against it. As one who had once the honour of sitting in that House, I now willingly risk the acquiring the name of a bad Author, that I may encrease the small number of constitutional Scotsmen.

Art. 27. A Description of the Freedom Box, voted by the City of London, to the Hon. Augustus Keppel, Admiral of the Blue. To which is prefixed, a succinct Account of his public Services. Printed for the Artist W. Carron, Little Marlborough 7 s. 6 d. Coloured 10 s. 6 d. Sold also by S. Hooper in St. Martin's Lane.

The engravings which accompany this description have considerable merit; nor are the designs desicient in elegance. The principal objection to them seems to be, that they are not, perhaps, sufficiently explanatory of the subject they are intented to illustrate and commemorate. It certainly is a mistake, which, even artists of the first reputation are very apt to fall into, that poetical allegory and emblematical device are the fame. Of poetical allegory it may be observed, that the terms which convey the image explain its meaning: but this is far from being the case when the idea is embodied by the pencil. How feldom is it, that allegorical painting, except when borrowed from a system of mythology obvious and familiar, can be fully understood without an explanation? This fault, to which allegorical painting ever must be liable, is of the same kind, though originating, indeed, from a different cause, with that of the fign-painter, who is obliged to write the name of the animal he has pourtrayed, that the traveller may know what it is.

POETICAL. Art. 28. Ode to the Rev. William Mason. By Eliza Ryves. 1 s. 4to. Dodfley.

There is a spirit in this little ode that will more than counterbalance the few triffing inaccuracies which an ill-natured critic might point out. The fair Authoress seems to have just ideas of the office and dignity of the muse; and while she reprehends the prostitution of poetry to purposes unworthy of it, she marks out, by the example of the gentleman to whom her poem is addressed, its proper application in the celebration of virtue.—In our 58th vol. p. 237, we noticed a volume of poems by this Lady; whose numbers we com-mended as easy, and not inelegant.

Art. 29. Ingratitude, an Ode; and Sir Salvadore, an Allegoric Poem. Canto the First. 8vo. 1s. 6d. Lincoln printed. Sold in London by Crowder.

A dull allegory, unenlivened by fancy or invention. The Author means to be wonderfully severe upon the American Congress. This poor and feeble imitator of Spenfer, resembles that immortal hard nearly in the same degree that a Lincolnshire fen goose resembles an cagle.

Art. 30. Ode, inscribed to Leonard Smelt, Esq. By Edward Burnaby Green. 4to. 1 s. Faulder. 1780.

A quaint and affected string of obscure, and far-fetched sentiments. If considered merely as an effusion of friendship, it may, on that score indeed, be intitled to some indulgence.

Art. 31. A Select Collection of Poems: with Notes, Biographical and Historical. 4 Vols. Small 8vo. 10s, sewed. Nicholi.

Mr. Nichols's own words will convey the best idea of the nature of his miscellany.

'On DRYDEN's foundation (lays he) the present superstructure is begun. In its progress, atmost every undertaking of a similar nature has been consulted, and material parts incorporated. The Collections formed by Fenton and Steele have been epitomized; whilst Pope's, PEMBERTON's, LINTOT's, and C. Tooke's, have occasionally contilbuted to embellishment.

' The Collection by Mr. R. D. DSLEY is allowed to be the completest of the kind; and with this the present publication is so far from interfering, that not a fingle poem is intended to be printed, which is either in "Dodsley's Collection," the Supplement to it by Mr. Pearch, or in the Sixty Volumes of the " English Poets," To all or either of these, therefore, this Selection will be a suitable appendage; and the more fo, as I have preserved some poems of

merit, which before were not known to have existed.

The Reader will find in these volumes some of the earliest productions of DRYDEN; some originals by Sir WILLIAM TEMPLE; at Ode by Swift, which had long been considered as irrecoverable; a confiderable number of good poems by STEELE, PARNELL, PENTON, BROOME, and YALDEN, with a few pieces by HALIFAX. Dorset, Rochester, Sprat, Priort, Pope, Bolingbroke, Philips, King, Smith, Watts, Pitt, Hughes, A. Philips, and TICKELL, which are not to be found in any edition of their works.'

As a postscript to Mr. Nichols's presace, we may add, that his collection contains many things that are curious, and on that account worth preserving, and some few others that are intrinsically valuable and ingenious.

"Safe, although dirty, to your inn."
This certainly is sterling tense. -- It would give me great pleasure to be enabled to present these Dialogues to the world; but where they are now deposited is unknown.

<sup>+</sup> The following anecdotes of this excellent Poet being curious, I print them in the words of the friend from whom they are received; "At lord Oxford's feat at "Wimple (now lord Hardwick's) there hung a fine picture of Harley in his 46 Speaker's robes, with the roll of the bill in his hand for bringing in the prefent family; which, if I mistake not, was done by his casting vote. In allusion to 46 Harley's being afterwards sent to the Tower, Prior wrote with a pencil on the et white scroll, Bill paid such a day .- The late Recorder of Cambridge [Pont] had 44 feen fome MS. Dialogues of the Dead of Prior's; they were profe, but had verfe 44 intermixed freely: and the specimen, I heard, proved it, The Dialogue was be-"tween Sir Thomas More and the Vicar of Bray. You must allow that the cha-44 racters are well chosen; and the speakers maintain their respective opinions smart-44 ly: at last the Knight seems to come over to his adversary, at least so far as to " allow that the doctrine was convenient, if not honourable; but that he did not fee how any man could allow himself to act thus; when the Vicar concludes; Nothing easier, with proper management; &c. You must go the right way to " work-

<sup>&</sup>quot; For Conscience, like a fiery horse, " Will flumble, if you check his course;

<sup>&</sup>quot; But ride him with an eafy rein, " And rub him down with worldly gain,

e He'll carry you through thick and thin,

. Mr. Nichols, we apprehend, has received into his Collection many pieces which would have been better omitted. Of these we more parsicularly reprobate the many tedious translations from the Greek and Roman classics, which abound in every volume. The Writers of the last century seem to have had very impersect ideas of translation; doing into English, was, in general, the utmost of their ambition. There are few translations here exhibited, but what are infinitely inferior to more modern ones that are in every body's hands.

The biographical notes and anecdotes with which the different poems are illustrated, are entertaining and valuable, and do credit to the care and industry of this accurate and very intelligent Editor. Artr 32. Poems on Various Subjects; selected to inforce the . Practice of Virtue; and with a View to comprise in One Volume, the Beauties of English Poetry. By Thomas Tomkins. 18mo.

23. sewed. Wallis. 1780. Let the ancient artist, who inclosed the Iliad of Homer in a nutshell, from this time be forgotten:—the more ingenious Mr. Tomkins has comprised in one little volume, fairly printed, all the beauties of English poetry, and after all, left room for pieces which are not beauties!

Nove L.

History of Lady Bettesworth and Captain Hastings. In a Series of Letters. 2 Vols. 12mo. 6 s. Noble. 1780.

It is not easy to 'hit off to a nicety' the distinct characters of the numerous novels which come before us. We shall not however be far from the mark, if, with one stroke of our ' feathered instrument,' we pronounce this history, trisling in incident, consused in method, inelegant in language, and in short, (as the Author of a late Tour would fay) insipid ' to a degree."

PHILOSOPHICAL.

Art. 34. Bbildophical Considerations, or a Free Enquiry into the Merits of a Controversy between Dr. Priestley and Dr. Price, on Matter and Spirit, and Philosophical Necessity, with an introductory Essay on the Subject at large. By M. Dawes, of the Inner-Temple, Esq; Author of an Essay on Intellectual Liberty and

Toleration. 8vo. 18. 6d. Cadell. 1780.

The Author of these Confiderations, which he styles Philosophical, has introduced them with a defence of Free Thinking, in its plainest and most obvious sense; to which we should have entirely affented, had he only limited the privilege to those who are capable of thinking. It is the general neglect of this limitation, which has brought the term into that contempt from which our Author is by no means quelified to rescue it. He does not (like the animated Author of the Slight Sketch \*) pervade the whole controverly, and state those characteristic circumstances which discriminate the several performances, but confines himself to the friendly dispute between Dr. Priestley and Dr. Price, and states the sentiments of each on the several points in debate, with his own observations on them. It must, however, be obvious, that a brick or a board cannot be less a specimen of a house, than detached sentences are of a controversy. To those who

pare

<sup>·</sup> See Review for March, p. 223.

have no other knowledge of the dispute than is afforded by the prefent work, many of these sentences will be unintelligible; and those who are already acquainted with its will find either a want of difcernment, or a want of candor in the selection. His own observations are seldom clear, or easy to be understood,-nor are they often pointed or important. His end is to show, that little has been added to our flock of knowledge from the debate, and that, when Prieftley fays, that the foul does not ' lose its existence' at death, and Price allows that it is ' suspended' after death, they approach so nearly to each other, that we are unable to discern the difference. We have not leisure, at present, to enquire what public benefit may have refulted from the controversy, but cannot help suggesting, that many, whose characters, as authors and philosophers, are now exposed, might have been safe, if it had been never started. Mr. D. in the passage just quoted, does not perceive, that the great question of matter and spirit is not affected by this mutual acknowledgment of the two opponents. If the operations of the foul refult only from a certain organization of matter, and the atoms of which this material machine is constructed are unperishable, as Newton, Leibnitz, and Prieslley, have allowed, the soul cannot lose its existence, for the feveral atoms may, in any future period, be again arranged in the same manner, and make up a being identically the same as before. It is clear, therefore, that however similar their ideas may appear in this expression, it does not affect the real question, whether the animation of this machine depend on a certain arrangement of matter, or on the union of an immaterial principle with it. Mr. D. is better founded in the observation which follows this comparison. If, says he, the resurrection be only the re-animation and re-arrangement of material particles, man is still subject to a second decay, and is not fitted for eternity; but on this part, for obvious reasons, we shall make no comment. Part. E'AST-INDIES.

Art. 35. Thoughts on improving the Government of the British Territories in the East Indies. 8vo. 1 s. 0 d. Cadell. 1780.

The inexpediency of intrusting the civil government of so extenfive and important a territory as that subject to the British Empire in the East Indies, to a mercantile body, has long been perceived, and is, in this sensible pamphlet, clearly laid open. To remedy the inconveniences which have arisen from the government of the Company, the Anthor proposes, I. That the British Government should shablish such an immediate agency in India, as should give the natives of our own territories a perception, that they live under the authority and protection of the state itself, and affure the Asiatic powers, with whom we are connected, of their undisturbed continuance in their present dominions. II. That, to promote the prosperity of the natives inhabiting the British settlements, and engourage indultry, the pernicious custom of letting the lands for a fort space of time should be abolished, and the lands be either fold in perpetuity, transferrable according to the Gentoo or Maho-metan practice, or be let for very long terms. This would raife, on the most equitable terms, about ten millions sterling, besides an annual quit-rent of confiderable value; at the same time that it would would be the greatest possible benefit to the natives. III. That, to chablish the civil power in the East-Indies on a regular, efficacious, and permanent footing, the Governor's office should be new modelled, and accurately defined—that a general superintending government should be established, resident (according to the late Lord Clive's ideas) not at Calcutta, but at Muxudabad, whose authority should be without specific restraint;—that the Governor should be invested with a power of putting a negative upon the proceedings of his Council; - and that not needy adventurers, but men of reputation, ability, and connection, should be placed at once in the higher stations of the government in India: this would give strength and confistency to the whole British Government in Asia, and probably prevent the renewal of those destructive scenes, which have exposed us to the contemptuous hatred of the natives, and the ridicule of Europe. IV. That justice should be administered where the natives are interested, without a rigid adherence to the forms of Emplish law, and the Supreme Court be at liberty to act rather as arbitrators than as lawyers.

These points, with some others nearly connected with them, our Author discusses with much good sense and precision. As they are points which will merit particular attention, when the affairs of the East-Indies come under the consideration of the Legislature, this publication is extremely seasonable, and may be of great utility.

SCHOOL-BOOK.

Art. 36. A Practical Grammar of the French Language. By N.

Wanostrocht. 12mo. 2s. Johnson, &c. 1780,
To prevent the inconvenience, in teaching, of referring from book to book, this Author has undertaken to comprise in one volume the effential elements of the French language, with such exercises as are necessary in acquiring a facility of writing and speaking it: and he has, in our opinion, executed the design very successfully; with the material advantage of having a more perfect knowledge of the English language, than commonly falls to the lot of French teachers.

PAMPHLETS on the Popish BILL.

Art. 37. A Letter to a Dissenting Minister, containing Remarks on the late Act for the Relief of his Majetty's Subjects, professing the Popish Religion, with some Strictures on the Appeal from the Protestant Association to the People of Great Britain; also, Extracts from several Acts of Parliament; with a Brief State of the Penal Law, as it now stands, showing, that neither Popish Priests nor School Masters are legally tolerated in exercising any Part of their Functions; and recommending Christian Charity and Forbearance towards all the peaceable Worshippers of God. By a Lay Dissenter, 8vo. 6 d. Nicoll. 1780.

This very copious title sufficiently expresses the design of this well intended and judicious pamphlet.

It is with particular pleasure that we present our Readers with the following extract: 'I am glad, Sir, to find, that the applications which the Association have made to the several Differing congregations in and about London, have met with that contempt which the permicious views of the leading associators deserve. Some ministers have indeed joined them, and several of the laity have contributed

to their designs by their names and by their money; but almost all the regular Dissenting ministers, with much the greater part of their congregations, have behaved as good subjects, and done real honour to the Protestant cause.'-We have observed with indignation and disdain, the malignant but impotent attempts of some Newspaper scribblers, to fix a foul opprobrium on the Dissenters, by charging to their account the cause of the late riots in the capital. was as falle as it was invidious, and could gain no credit, unless amongst a set of men whose bigotry having clouded their understandings, left them the sport of a senseless credulity. To calumniate a whole body for the misconduct of a few, is grossly illiberal: and we cannot avoid remarking, that the members of the Church of England will on this partial mode of judgment condemn the very cause they are fo zealous to support, for the measure which they mete will be measured to them again.' Our interest in particular, as well as common justice, concur to prove, that " all mankind's concern is CHARITY."

Art. 38. A Reply to an Appeal from the Protestant Association, to the People of Great Britain, &c. wherein the fallacious Arguments of that Pamphlet are sufficiently exposed, and candidly refuted. 8vo. 6d. Dilly. 1780.

The Author is a warm advocate for the late bill in favour of the Roman Catholics. He writes with spirit, and reasons with much

Mrewdness.

We imagine, indeed, that we perceive some little predilection for Popery in this performance, though the Author strongly disavows the character of a Papist. Let me not (says he) be thought a Papist, pleading the cause of popery, for I am a Protestant, jealous of my civil and religious liberties, and profess myself a Christian.

Zealous Protestants have been very loud in their declamations, against one of the most enormous corruptions of the Romish Church, viz. the exaction of pecuniary fees for certain crimes committed by its members, according to a rate established by the Conclave at subich the Pontiss pre-fided. This matter, according to the Author of the present Keply, hath been most grossly misrepresented by Protestant writers; and he considers it as a duty incumbent on him, as a man not bigotted to any party, to set this circumstance in a tair and impartial light.

At a grand conclave, held in Rome, at which the Pope prefided, at was taken into confideration, to curb the wickedness of men by some wholesome check, exclusive of the civil power. The doctrine of confession was already so sufficiently established, that sew ever omitted to acknowledge before the priest the crimes of which they had been guilty. It was, therefore, by them confidered, that certain sees, levied by the Confessor, upon the crimes and sollies of mankind, would be serviceable to their morals, while it would produce a revenue to the state, infinitely superior to any poll-tax ever levied; and accordingly an edict passed to that intent. But the act of confession, or of receiving absolution, by no means exempted the guilty person from the punishment incurred by his crimes from the civil law. It was only this: The person guilty came to his confessor to relieve his conscience of a burden: the holy Father injoined him penance and repentance for his sins: and if he had robbed, cheated, or defrauded,

or any way deceived his neighbour, straightway to make him reparation, and pay the fees established by the church : and if he renented him fincerely of the crime, then, in the name of God, does he absolve him. But this man coming forth from his confessor, being suspected or accused, might, and still may be arrested by the civil power, and tried, and if found guilty, punished or executed as the law should direct; whether the crime committed be towards a Papist or a Heretic. The absurdity of concluding, that absolution was an exemption from the civil law, and at any time to be obtained for the trivial gratuity of a few shillings, is so contrary to all common fense and reason, that it is scarcely credible that any one car What would become of that state where be so weak as to credit it. every enormity could be committed under the protection of, and Greened from justice by, a purchased absolution? It could not subfift a twelvemonth. All would be anarchy and confusion; for of what use would be the civil law if subject to the controll of religious tenets acting in opposition to its doctrine?'

This representation of the matter is very plausible in a merely solitical view of it:—but we think, it will not be quite satisfactory to those Protestants who consider ALL absolutions by priests as presumptuous and invalid—all pecuniary mulcits as totally inconsistent with the design and end of the Christian institution; and the pretence, on which the practice of exacting them is founded, as a mere artisace of priestcrast, and one scandalous and permicious effect of an usurped

anthority over the consciences of mankind.

"A trivial gratuity of a few shillings,' paid to the priest in private, will go but a little way in 'curbing the wickedness of men; and instead of proving 'a wholesome check,' will, in our opinion, be rather an encouragement to vice—especially that which comes not under the cognisance of the civil power. The paying it, indeed, may 'relieve conscience of a burden,' and when it can be relieved seafly, we fear it will make little scruple to avoid a fresh burden.

RELIGIOUS and CONTROVERSIAL.

Art. 39. A farther Inquiry into the Case of the Gospel Demoniacs.

Occasioned by Mr. Farmer's Letters on the Subject. By William
Worthington, D. D. 8vo. As, sewed, Rivington, &c. 1770.

Worthington, D. D. 8vo. 4s. sewed. Rivington, &c. 1779. We find so much to censure, and so little to commend, in this last publication of a deceased Writer, that, for the sake of his reputation, we could willingly pass it over in silence: but this would be incompatible with the nature of our undertaking. The maxim, Nil de mortuis, nift behum, is not binding upon Reviewers. We owe it to the Public to give a just character of every performance that comes before us; and if the Author have discovered a bad spirit, it is our duty to reprove and condemn it, even though death may have placed him beyond the reach of our censures.

In our account of Dr. Worthington's former publication on the case of the Gospel demoniacs \*, we noticed and censured the weak-ness of his arguments, and the disingenuity and illiberality of his representations and reflections. The present work is equally descient in judgment and candour. The Doctor appears to have set about it

<sup>•</sup> See Review, vol. lvii. p. 389.

with a mind full of resentment against Mr. Farmer, and with a determination to treat him with severity and rudeness. We looked in. vain for the " new matter" which he promises at the beginning. We found little more than a continued petitie principii, and a perpetual train of gross mistakes and misrepresentations, intermixed with low and illiberal reflections. They who deny the reality of demoniacal possessions are still suspected of disbelieving the personality and divinity of the Holy Ghost: it is still thought' matter of serious consideration, whether the speaking a word against Christ's casting out devils by the Spirit of God, be not speaking against him, and that Divine Spirit too.' Pomponatius and Bekker are still ranked among irreligious and atheistical writers. Dr. Worthington acknowledges that he never faw Bekker's work, but upon the credit of some nameless person he pronounces it a very moderate persormance, and intimates, without the shadow of proof, that Mr. Farmer may have been obliged to him both for argument, and for some quotations from the ancients.' The Doctor still afferts, that the devil's entering into Judas, after the fop, confirms the opinion that evil spirits conveyed themselves into men's bodies at meals, and that Simon Magus saw evil spirits forced out of the bodies of men in a public manner; and still charges Mr. Farmer with countenancing the notion, that it is lawful to profess one thing and believe another, and with undermining the doctrine of a future state. We are forry that Dr. Worthington paid so little regard to the friendly counsel we gave him at the close of our remarks on Mr. Farmer's Letters . It is to be regretted that a Writer, who had acquired a reputation for benevolence and candour by his earlier performances, should discover such a bigotted and uncharitable disposition in his last publications. But such is the effect of a fond attachment to system, and of an unbridled zeal for indefenfible opinions!

Art. 40. Two Sermons, preached at Norwich. By Samuel. Parr, A. M. 4to. 1 s. 6 d. Norwich, printed. London, fold by

Baldwin, &c. 1780.

**}**{·

These discourses are published by request. The Author speaks of them with much dissidence; but they are sensible and judicious performances. In the first, from Gal. iv. 4. he treats of the time of our Saviour's appearance, and in a strain of close and calm reasoning endeavours to obviate some objections which have been offered. His remarks are worthy of the Reader's serious attention, though they do not properly admit of extracts. Those who are much acquainted with these subjects will sometimes think of Butler's Analogy, to which performance the Preacher also directs us. The second sermon was delivered on a charitable occasion, from Hebrews, xiii. 16. It is peculiarly designed to defend the utility and importance of charity-schools, and break the force of some objections against them, 'which sobserves this writer] have grown up, I fear, to popularity, among persons of copsious tempers and shallow understandings.' The last words of this sentence are, we apprehend, rather harth, and not entirely congruous to the Author's general strain of expression; but the dis-

<sup>· · ·</sup> See Review for June 1778.

courso is full of good sense and argument, and evinces the Preacher's humanity and piety.

Art. 41. The Foundery Budget opened; or, the Arcanum of Wesleyanism disclosed. By John Macgowan. 8vo. 9d. Keith, &c. 1780.

Mr. Macgowan, one of Mr. Wesley's most potent antagonists of the present day, zealously attacks the peculiar doctrines of the Foundery. Those who wish to know what are the modes of faith, &c. for which Mr. Macgowan contends, may be referred to this trad,—to his Dialogues of Devils,—to his Familiar Epistles to Dr. Priessley,—his Socinianis brought to the Test,—his Death, a Vision,—his Shaver's Sermon on the Oxford expulsion (12th edition)—his Life of Joseph, &c. &c.—Or, they may resort, for farther satisfaction, to his meeting-house in Devonshire Square; which must, no doubt, be a safer and surer way to heaven, than through Moorsields, by the Foundery.

#### SERMONS.

I. National Calamities founded in national Differtion and Differation.

Preached on the late General Fast. By William Hunter, A. M. Minister of St. Paul's Liverpool, and Fellow of Brazen Nose College, Oxford. 4to. 1 s. Cadell.

"Heady, not itiong, and foaming, but not full."

The Preacher hath in this fermon very well illustrated that species of the bombast which the Roman and English satirists have made the subject of their ridicule in the above lines.

The rage of this discourse is foamed out most unmercifully against the secret intrigues and subdolous machinations of the consederated sepublican faction'—' the seditious demagogue and envious Presputar'—' the hydra-headed monster, which now assumes every shape, and explores various regions to rob us of our civil and religious rights'—against those who 'had breathed a poisonous air in the bogs of a Leyden or Geneva, where every wholesome consideration, whether matural or moral, for native soil and clime, were counteracted, stupified and drowned.'—But the venom of this frotby discourse is mixed up by Mr. Hunter for Sir William Howe and Admiral Keppel much more abundantly. Nevertheless, as he prepared it in his wrath, and scatters it about in his fore displeasure, friends as well as soes may be injured by it; and on that account we think it prudent to retire for our own safety.

II. Preached at York on the 20th of March, 1780, for the Benefit of the Lunatic Atylum. By James Scott, D. D. Rector of Simonburn, and late Fellow of Trinity College, Cambridge. 4to. 18. Cadell.

This truly fensible and benevolent discourse does equal credit to the understanding and disposition of the Author. Its object is so humane, that every generous heart must wish it the greatest success: and Dr. Scott hath pleaded its cause with such sound judgment, and unaffected eloquence, that we think the coldest hearts must take some share in its interest.

The

The Author adopts Mr. Farmer's hypothesis respecting demoniacal possessions, and offers some brief but very cogent reasons in support of it?.

In the more pathetic part of this discourse the Preacher is moderate, but not dull, and wishes rather to persuade by gentle reasoning, than inveigle by extravagant declamation. The latter is that sparious kind of oratory, which is only calculated to fascinate the vulgar, but which the wise will ever turn from with contempt and disgust. The former, while it engages the heart, enlightens the understanding; and though its effects may not be violent, they will be lasting; as, where the stream is silant, it is often deep.

We shall select one passage to justify our approbation of Dr. Scott's

Will in the pathetic.

Speaking of the poor lunatic as 'a forlorn individual,' he thus describes him. 'He stands in the world like a rock in the midst of the wast Atlantic, the dread and terror of those who approach him, and exposed to the fury of his own wild and tempestuous passions! Cut off from all the relations and charities of life, he is dead to the joys of friendship, the soft endearments of conjugal tenderness, the inexpressible, heart-felt yearnings of paternal affection, and every other gentle fympathy which God hath graciously ordained, to make our journey through this vale of tears less wearisome and painful. In short, infanity is the parent of dismal thoughts, dilleacting terrors, and horrible apparitions, which not only rob the foul of the sweetelt comforts and most endearing connections of human life, but render it also incapable of those purer and sublimer pleasures which arise from a pursuit of knowledge, an investigation of truth, a communion with God and Christ, and a stedfast assurance of a glorious and blessed immortality.

"Surely the Divine Philanthropist, who went about doing good, could not select fitter objects of his power and compassion than these: nor can we better imitate his example, than by promoting the institution for which I am here an advocate; an institution sounded entirely for the relief of these afflicted, pitiable wretches." We trust these benevolent wishes will produce something more than love and essential

for the Preacher who uttered them.

III. The Scripture Doctrine of Grace explained in a Commemoration Sermon upon the Conversion of St. Paul. By the Rev. C. Da Coetlogon, A. M. 8vo. 6d. Dodsley. 1780.

This is a precious banquet for the dear, tender lambs of the Tabernacle. Our high-stomached rationalists may have no appetite for such simple food: but babes and sucklings must be fed, as well as Carrong men; and we heartily wish their milk may do them good.

The Excellency of the facred Writings, illustrated in a Sermon preached to raise a Subscription to purchase Bibles to distribute among the Navy and Army of Great Britain and Ireland. Addressed to his Majesty. By Clericus. 8vo. 6 d. Dodsley. 1780.

<sup>•</sup> The text is from Mark v. 15.

V. The Power of Faith confidered-at Sr. Ann, Black-Friars, March 19, 1780, for the Benefit of a Society instituted for the Purpose of distributing Bibles among his Majesty's Forces by Sea and Land. By William Bromley Cadogan, A. M. Rector of St. Luke's, Chelsea, and of St. Giles's, Reading, and Chaplain to Lord Cadogan.

8vo. 6 d. Rivington. 1780.

Mr. Cadogan informs us in his Preface, that 'a number of religious persons have entered into an association to furnish his Majesty's. army and navy with the brightest ornament and proper badge of a Protellant, the BIBLE. For them this discourse was preached; and to testify my bearty concurrence with them, it is now made public-That foldiers and failors were never more needful than at this alarming crifis, I believe nobody will deny. That they are never completely armed without the ARMOUR OF God, deny it who will, I dare to affirm and appeal to Scripture, to reason, to fact and experience for the truth of the affertion.'-Mr. Cadogan and his coadjutor, Mr. Clericus, alias Coetlogon, have our hearty wishes for their success in procuring as many Bibles as they can for the use of his Majesty's army and navy—as long as they are satisfied with putting the plain word of God, without enthufiaftical interpretations of it, into the hands of poor illiterate foldiers and seamen. The Bible is sufficient. " Here is Music (as Mr. Cadogan says) to which, if we had faith, we might march to eternity.

VI. Liberty Moral and Religious. A Sermon preached before the University of Cambridge, on Feb. 27, 1780, at Great St. Mary's Church. By William Cooke, M. A. Fellow of King's College.

410. 1 s. Cadell. 1780.

VII. Civil Liberty. A Sermon preached before the University of Cambridge, on April 9, 1780, at Great St. Mary's Church. By William Cooke, &c. 4to. 1 s. Cadell.

These Discourses are very logical and very dry. There is a great parade of Aristotelian ratiocination and refinement in them. The. Author's capital object is, to overthrow those theories of government which have been generally adopted by writers of the most liberal

and independent principles.

The Author of the Letter to Dr. Watfon would perhaps produce the following as a specimen, not only of sound politics, but of the true sublime. The Mosaic history, confirmed by the best Heathen testimony (viz. by Aristotle), gives us a very natural account of the rise and progress of society from families to tribes, from tribes to pations; severally dependent, first on fathers, next on patriarchs, then on governors. Dependency implies power. Be that where it will, it is enough for us that it is; and as Scripture teaches us-from God. We receive it as his gift:—we own its influence:—we feel its bleffings: - whether collected in one stream, it flow strait and rapid, or circulate more flowly with divided current-it is still manifest-a work of God .- Nor does it like the Nile mock our gratitude, and frustrate all attempt to trace it to its source, and present the first fruits of its rich exuberance at the sountain head—the house of waters .- 'Tis thine, O Power, to ascertain and protect our rights of nature, and ingraft thy penalties on the natural restrictions of the human will! observant of these rights-obedient to these restraints, accordingly

accordingly as they are adjusted and secured by thee-we are free-in any government. But if, with an evil eye, and a false heart, we mistake these, and cast off the others—we make malicious use of our libertyapolitates from all engagements—to God—or man—or country.' VIII. Christian Submission to Civil Government: A Discourse preached

on Jan. 30, 1780, at the Meeting-house in St. Andrew's, Cam-By Robert Robinson. 8vo. 6d. Buckland. 1780.

Another Cambridge orator !- but in almost every respect the reverse of the former. Instead of the dull and crabbed logician, advancing by short steps, we have here a volatile declaimer bounding rapidly on the wings of republican zeal o'er some of the awful inclo-

fures of Majefty itself.

Mr. Robinson hath chosen a text \* that at first fight makes little for his purpose. The Sacheverells have universally claimed it as their prescriptive property. But our shrewd and ingenious Preacher disputes the validity of that claim; and, with much spirit and plausibility too, hath rescued it from monarchical oppression, and given it liberty to range at large on the republican common.

We can pay Mr. Robinson the compliment that Alumnus (the author of Fanatical Divinity exposed) did not merit for his attempt at

turning of tables.

36

" It is sport to see the engineer hoist with his own petar."

Romans xiii. 1-7.

ERRATA.

A mistake has been discovered in p. 555, of our last Appendix, occasioned by the transposition of two or three words. The sense will be restored by reading the passage, corrected as follows:

"The death of Cardinal Richlieu and of Lewis the XIIIth; the rife, favour, and qualities of Mazarin; and the beginning of the regency of Ann of Austria,—make an interesting part of the contents of the fixth book. In the same period, the Frondeurs 1, though supported by the Parliament, and become masters of the metropolis, by the famous Jour des Barricades, are obliged to conclude a peace that was followed by a variety of intrigues, in which the political operations of Mazarin are curious, and well represented.'-The seventh, eighth, &c.

In the title of Mr. de Luc's Lettres Physiques et Morales, &c. (in the same Appendix) Mr. Dodsley's name is by mittake inserted. The work is fold by Mr. Elmfly in London.

In our last,-p. 67, in the note, for Mrs. read Mr. Capel Lofft.

.1

<sup>‡</sup> A name given to the malcontents, or anti-ministerial party. The other party were called Mazarins.

#### THE

# MONTHLY REVIEW,

For SEPTEMBER, 1780.

## 

ART. I. Young's Irifb Tour. ART. CONCLUDED. See last Month's Review.

R. Young's Work, it is to be observed, is divided into two Parts. In one, the minutes of his journey are registered, simply as they arole; in the other, they are digested and methodized, so as to bring the principal corresponding articles of information into the same point of view. It is this latter Part which is now under consideration. The subject is divided into 24 sections: the first treats of the extent of Ireland; the second, of the soil and sace of the country: the third, of the average rental. From various deductions, Mr. Young makes it appear, that rents in Ireland are to those of England as two to five.

From the next section we learn, that the products in wheat are as nine to twelve; and in barley and oats, as seven to eight of nine.

In the section which sollows, and which is a very important one, the state of the tenantry comes under consideration. In Ireland, as in many parts of Scotland, G ntlemen of fortune let their estates to one man, who is called the Middle man; he re-lets, at a profit rent, to the occupying tenant. This system, which is not without its detenders and advocates, oppressive and ruinous as it is, Mr. Young reprobates in the strongest and most pointed terms, deducing a great part of the misery and wretchedness of the common people in Ireland, and, indeed, of the kingdom in general, from this prolific source. Those who have estates upon such tenure will do well to give this section an attentive perusal; as also that which follows it, on the labouring poor.

Vol. LXIII, M On

On this head Mr. Young observes, that ' such is the weight of the lower classes in the great scale of national importance, that a traveller can never give too much attention to every circum-flance that concerns them; their welfare forms the broad basis of public prosperity; it is they that feed, clothe, enrich, and fight the battles of all the other ranks of a community; it is their being able to support these various burthens without oppression, which constitutes the general selicity; in proportion to their ease is the strength and wealth of nations, as public debility will be the certain attendant on their misery. Convinced that to be ignorant of their slate and situation in different countries, is to be desicient in the sirst rudiments of political knowledge, I have upon every occasion made the necessary enquiries, to get the best information circumstances would allow me. What passes daily, and even hourly, before our eyes, we are very apt entirely to overlook; hence the surprising inattention of various people to the food, clothing, possessions, and state of the poor, even in their own neighbourhood; many a question have I put to gentlemen upon these points, which were not answered without having recourse to the next cabbin; a source of information the more necessary, as I found upon various occasions, that some gentlemen in Ireland are infected with the rage of adopting fystems as well as those of England: with one party the poor are all starving, with the other they are deemed in a very tolerable fituation, and a third, who look with an evil eye on the administration of the British government, are fond of exclaiming at poverty and rags, as proofs of the cruel treatment of Ireland. When truth is likely to be thus warped, a traveller must be very circumspect to believe, and very asfiduous to fee.'

Speaking of their provisions, and their manner of subsistence, he remarks, that ' the food of the common Irish, potatoes and milk, have been produced more than once as an instance of the extreme poverty of the country, but this I believe is an opinion embraced with more alacrity than reflection. I heard it stigmatized as being unhealthy, and not sufficiently nourishing for the support of hard labour; but this opinion is very amazing in a country, many of whose poor people are as athletic in their form, as robust, and as capable of enduring labour, as any upon earth. The idleness seen among many when working for those who oppress them, is a very contrast to the vigour and activity with which the same people work when themselves alone reap the benefit of their labour. To what country must we have recourse for a kronger instance than lime carried by little miferable mountaineers thirty miles on horses back to the foot of their hills, and up the steeps on their own? When I see the people of a country in spite of political oppression with well formed vigorous bodies, and their cottages swarming with children; when I see their men athletic, and their women beautiful, I know not how to believe them subsisting on an unwholesome food.

At the same time, however, that both reason and observation convince me of the justice of these remarks, I will candidly allow that I have seen such an excess in the laziness of great numbers, even when working for themselves, and such an apparent weakness in their exertions when encouraged to work, that I have had my doubts

of the heartiness of their food. But here arise fresh difficulties; were their food ever so nourishing, I can easily conceive an habitual inactivity of exertion would give them an air of debility compared with a more industrious people. Though my residence in Ireland was not long enough to become a perfect master of the question, yet I have employed from twenty to fifty men for several months, and found their habitual laziness or weakness so great, whether working by measure or by day, that I am absolutely convinced 1 s. 6 d. and even 2 s. a day in Suffolk or Hertfordshire much cheaper than sixpence halfpenny at Mitchelstown: it would not be fair to consider this as a representation of the kingdom, that place being remarkably backward in every species of industry and improvement; but I am asraid this observation would hold true in a less degree for the whole. But is this owing to habit or food? Granting their food to be the cause, it decides very little against potatoes, unless they were tried with good nourishing beer instead of their vile potations of whisky. When they are encouraged, or animate themselves to work hard, it is all by whisky, which though it has a notable effect in giving a perpetual motion to their tongues, can have but little of that invigorating substance which is found in strong beer or porter; probably it has an effect as pernicous, as the other is beneficial. One circumstance I should mention, which seems to confirm this, I have known the Irish reapers in Hertfordshire work as laboriously as any of our own men, and living upon potatoes, which they procured from London, but drinking nothing but ale. If their bodies are weak, I attribute it to whisky, not potatoes; but it is still a question with me whether their miserable working arises from any such weakness, or from an habitual laziness. A friend of mine always refused Irishmen work in Surrey, saying his bailiff could do nothing but settle their quarrels.

But of this food there is one circumstance which must ever recommend it, they have a bellyfull, and that let me add is more than the superfluities of an Englishman leave to his family: let any person examine minutely into the receipt and expenditure of an English cottage, and he will find that tea, sugar, and strong liquors, can come only from pinched bellies. I will not affert that potatoes are a better food than bread and cheese; but I have no doubt of a bellyfull of the one being much better than half a bellyfull of the other; still less have I that the milk of the Irishman is incomparably better than the small beer, gin, or tea of the Englishman; and this even for the father, how much better must it be for the poor infants; milk to them

is nourishment, is health, is life.

If any one doubts the comparative plenty, which attends the board of a poor native of England and Ireland, let him attend to their meals: the sparingness with which our labourer eats his bread and cheese is well known: mark the Irishman's potatoe bowl placed on the sloor, the whole samily upon their hams around it, devouring a quantity almost incredible; the beggar seating himself to it with a hearty welcome; the pig taking his share as readily as the wise; the cocks, hens, turkies, geese, the cur, the cat, and perhaps the cow—and all partaking of the same dish. No man can often have been a witness of it without being convinced of the plenty, and I will add the chearfulness, that attends it.'

4

After confidering the fituation of the Irish poor with respect to some other circumstances attendant upon the r condition, he proceeds to a matter of very serious impor, and which seems to call loudly for redress. The nature of this grievance will be best learned from his own words:

 Before I conclude this article of the common labouring poor in Ireland, I must observe, that their happiness depends not merely upon the payment of their labour, their clothes, or their food; the subordination of the lower classes, degenerating into oppression, is not to be overlooked. The poor in all countries, and under all governments, are both paid and fed, yet is there an infinite ofference between them in different once. This enquiry will by no means turn out so favourable as the preceding articles. It must be very apparent to every traveller through that country, that the labouring poor are treated with barfhness, and are in all respects so little considered, that their want of importance seems a perfect contrast to their situation in England, of which country, comparatively speaking, they reign the fovereigns. The age has improved fo much in humanity, that even the poor Irish have experienced its influence, and are every day treated better and better; but still the remnant of the old manners, the abominable diffinction of religion, united with the oppresfive conduct of the little country gentlemen, or rather vermin of the kingdom, who never were out of it, altogether bear fill very heavy on the poor people, and subject them to situations more mortifying than we ever behold in England. The landlord of an Irith effate, inhabited by Roman Catholics, is a fort of despot who yields obedience in whatever concerns the poor, to no law but that of his will. To discover what the liberty of a people is, we must live among them, and not look for it in the flatutes of the realm: the language of written law may be that of liberty, but the fituation of the poor may speak no language but that of flavery; there is too much of this contradiction in Ireland; a long series of oppressions, aided by many very ill judged laws, have brought landlords into a habit of exerting a very lofty superiority, and their vassals into that of an almost unlimited submission: speaking a language that is despised, professing a religion that is abhorred, and being disarmed, the poor find themfelves in many cases slaves even in the bosom of written liberty. Landlords that have refided much abread, are usually humane in their ideas, but the habit of tyranny naturally contracts the mind, fo that even in this polished age, there are instances of a severe carriage towards the poor, which is quite unknown in England.

A landlord in Ireland can fearcely invent an order which a fervant labourer or cottar dares to refuse to execute. Nothing satisfies him but an unlimited submission. Difrespect, or any thing tending towards sauciness, he may punish with his cane or his horsewhip with the most persect security, a poor man would have his bones broke if he offered to lift his hand in his own defence. Knocking down is spoken of in the country in a manner that makes an Englishman stare. Landlords of consequence have assured me that many of their cottars would think themselves honoured by having their wives and daughters sent for to the bed of their master; a mark of slavery that proves

the oppression under which such people must live. Nay, I have heard anecdotes of the lives of people being made free with without any apprehension of the justice of a jury. But let it not be imagined that this is common; formerly it happened every day, but law gains It must strike the most careless traveller to see whole strings of cars whipt into a ditch by a gentleman's footman to make way for his carriage; if they are overturned or broken in pieces, no matter. it is taken in patience; were they to complain, they would perhaps be horsewhipped. The execution of the laws lies very much in the hands of justices of the peace, many of whom are drawn from the most illiberal class in the kingdom. If a poor man lodges a complaint against a gentleman, or any animal that chuses to call itself a gentleman, and the justice issues out a summons for his appearance, it is a fixed affront, and he will infallibly be called out. Where MANNERS are in conspiracy against LAW, to whom are the oppressed people to have recourse? It is a fact, that a poor man having a contest with a gentleman must - but I am talking nonsense, they know their fituation too well to think of it; they can have no defence but by means of protection from one gentleman against another, who probably protects his vassal as he would the sheep he intends to eat.

'The colours of this picture are not charged. To affert that all these cases are common, would be an exaggeration; but to say that an unfeeling landlord will do all this with impunity, is to keep strictly to truth: and what is liberty but a farce and a jest, if its blessings are received as the savour of kindness and humanity, instead of being

the inheritance of RIGHT?

"Consequences have slowed from these oppressions which ought long ago to have put a stop to them. In England, we have heard much of whiteboys, fleelboys, oakboyr, peep of-day boys, &c. But these various insurgents are not to be confounded, for they are very The proper diffinction in the discontents of the people is different. into Protestant and Catholic. All but the whiteboys were among the manufacturing Protestants in the North. The whiteboys, Catholie labourers in the South: from the best intelligence I could gain, the riots of the manufacturers had no other foundation, but such variations in the manufacture as all fabrics experience, and which they had themselves known and submitted to before. I ne case, however, was different with the whiteboys; who being labouring Catholics. met with all those oppressions I have described, and would probably have continued in full submission, had not very severe treatment in respect of tythes, united with a great speculative rise of rents about the same time, blown up the slame of relissance; the atrocious acts they were guilty of made them the object of general indignation: acts were passed for their punishment which seemed calculated for the meridian of Barbary; this arole to such a height, that by one they were to be hanged under certain circumstances without the common formalities of a trial, which, though repealed the following fessions, marks the spirit of punishment; while others remain yet the law of the land, that would, if executed, tend more to raise than quell an inforrection. From all which it is manifest, that the gentlemen of Ireland never thought of a radical cure from overlooking the real cause of the disease, which in fact lay in themselves, and not in the wretches M 3 they they doomed to the gallows. Let them change their own conducted entirely, and the poor will not long riot. Treat them like men who ought to be as free as yourselves: put an end to that system of religious persecution which for seventy years has divided the kingdom against itself: in these two circumstances lies the cure of insurrection; perform them completely, and you will have an affectionate poor, instead of oppressed and discontented vassals.

A better treatment of the poor in Ireland is a very material point to the welfare of the whole British empire. Events may happen which may convince us fatally of this truth—If not, oppression must have broken all the spirit and resentment of men. By what policy the government of England can for so many years have permitted such an absurd system to be matured in Ireland, is beyond the power of plain sense to discover.'

We have been much pleased with the political knowledge which is displayed on the article, Religion. Mr. Young proves, in the clearest manner, that the Popery laws have been

as impolitic and absurd, as they are wicked and unjust.

In the section in which he speaks of waste lands, we have the

following theory of the formation of bogs:

In the variety of theories which have been started to account for the formation of bogs, difficulties occur which are not eafily folved: yet are there many circumstances which assist in tracing the cause. Various sorts of trees, some of them of a great size, are very generally found in them, and usually at the bottom, oak, fir, and yew the most common; the roots of these trees are fast in the earth; some of the trees feem broken off, others appear to be cut, but more with the marks of fire on them. Under some bogs of a considerable depth there are yet to be feen the furrows of land once ploughed. The black bog is a folid weighty mass which cuts almost like butter, and upon examination appears to resemble rotten wood. Under the red bogs there is always a stratum, if not equally folid with the black bog, nearly so, and makes as good fuel. There is upon the black as well as upon the red ones a furface of that spungy vegetable mass which is cleared away to get at the bog for fuel, but it is shallow on these. Sound trees are found equally in both forts. Both differ extremely from the bogs I have seen in England in the inequality of the surface; the Irish ones are rarely level, but rise into hills. I have seen one in Donnegal which is a perfect scenery of hill and dale. The spontaneous growth most common is heath; with some bogmyrtle, rushes and a little sedgy grass. As far as I can judge by roads, laying gravel of any fort, clay, earth, &c. improves the bog, and brings good grass. The depth of them is various; they have been fathomed to that of fifty feet, and some are said to be still deeper.

From these circumstances it appears, that a forest cut, burnt, or broken down, is probably the origin of a bog. In all countries where wood is so common as to be a weed, it is destroyed by burning, it is so around the Baltic, and in America at present. The native Irish might cut and burn their woods enough for the tree to fall, and in the interim between such an operation, and successive

culture

wars and other intestine divisions might prevent it in those spots, which so neglected afterwards became bogs. Trees lying very thick on the ground would become an impediment to all streams and currents, and gathering in their branches, whatever rubbish such waters brought with them, form a mass of substance which time might putrefy, and give that acid quality to, which would preserve some of the trunks though not the branches of the trees. The circumstance of red bogs being black and folid at the bottom, would feem to indicate that a black bog has received less accession from the growth and putrefaction of vegetables after the formation than the red ones, which from some circumstances of soil or water might yield a more luxuriant surface vegetation, till it produced that mass of spunge which is now found on the surface. That this supposition is quite satisfactory I cannot assert, but the effect appears to be at least posfible, and accounts for the distinction between the two kinds. That they receive their form and increase from a constant vegetation appears from their rifing into hills; if they did not vegetate, the quantity of water they contain would keep them on a level. The places where the traces of ploughing are found, I should suppose were once fields adjoining to the woods, and when the bog rose to a certain height, it flowed gradually over the furrounding land.'

Ingenious as this theory may appear, there are objections to it, which we think will be insuperable. One, not the least material, is, that in America (as we learn from a gentleman who resided many years in a very uncultivated part of it, and where the practice of burning down woods has been followed at intervals for a century back) no such bogs as the Irish are to be met with in any of those places where the woods have been burned. It is an axiom in logic, that similar causes produce similar effects. It is possible, indeed, the intense frosts which prevail through the northern parts of America during the winter months may in some degree prevent the same cause from producing the same effect there as in Ireland, where the climate

is humid, and the weather mild and open.

When our Author comes to treat of manners and customs. he observes, possibly alluding to a late Tourist, that, 'it is but an illiberal business for a traveller, who designs to publish remarks upon a country, to fit down coolly in his closet, and write a satire on the inhabitants. Severity of that fort must be enlivened with an uncommon share of wit and ridicule, to please. Where very gross absurdities are found, it is fair and manly to note them; but to enter into character and disposition is generally uncandid, since there are no people but might be better than they are found, and none but have virtues which deserve attention, at least as much as their failings; for these reasons this section would not have found a place in my obfervations, had not fome persons, of much more slippancy than wisdom, given very gross misrepresentations of the Irish nation. It is with pleasure, therefore, that I take up the pen, on the present occasion; as a much longer residence there enables me to exhibit a very different picture; in doing this, I shall be free to remark, wherein I M 4 think think the conduct of certain classes may have given rise to general

and consequently injurious condemnation.'

The inhabitants of Ireland Mr. Young divides into three The first are persons of rank and considerable property; the second, country gentlemen, and renters of land; the last class consists of those in still lower situations. In characterizing the last, the circumstances which struck our traveller most in the common Irish were, 'vivacity, and a great and eloquent volubility of speech; one would think they could take souff and talk without tiring till doomid y. They are infinitely more chearful and lively than any thing we commonly fee in England, having nothing of that incivility of fullen filence, with which fo many Englithmen from to wrap themselves up, as if retiring within their own importance. Lazy to an excels at work, but so spirit dly active at play, that at burling, which is the cricket of favages, they shew the greatest feats of agility. Their love of fociety is as remarkable as their curiofity is infatiable; and their hospitality to all comers, be their. own poverty ever fo pinching, has too much merit to be forgotten. Pleased to enjoyment with a joke, or witty repartee, they will repeat it with such expression, that the laugh will be universal. Warm friends and revengeful enemics; they are inviolable in their fecrecy, and inevitable in their refertment; with such a notion of honour, that neither threat nor reasond would induce them to betray the fecret or person of a man, though an oppressor, whose property they would plunder without ceremony. Hard urinkers and quarrelionie; great liars, but civil, submissive and obedient. Duncing is so universal among them, that there are every where it nerant da cing mailers, to whom the cottars pay fix-pence a quarter for teaching their families. Besides the Irith jig, which they can dance with a most luxuriant expression, minuets and country dances are taught; and I even heard some talk of cotillions coming in.

Some degree of education is also general; hedge schools, as they are called (they might as well be termed ditch ones, for I have teen many a ditch full of schools, are every where to be met with where reading and writing are taught. Schools are also common for men; I have seen a dozen great sellows at school, and was told they were educating with an intention of being priests. Many strokes in their character are evidently to be ascribed to the extreme oppression under which they live. If they are as great thieves and liars as they are

reported, it is certainly owing to this cause.'

After doing justice to the politeness and urbanity of those in the more elevated ranks of life, he concludes with a race of people, against whom, as may be collected from many different parts of this volume, he seems to have a particular spleen. I must now come, says he, to another class of people, to whose conduct it is almost entirely owing, that the character of the nation has not that lustre abroad, which, I dare affert, it will soon very generally merit: this is the class of little country gentlemen; tenants, who drink their claret by means of profit rents; jobbers in farms; bucks; your fellows with round hats, edged with gold, who hunt in the day, get drunk in the evening, and fight the next morning. I shall not dwell on a subject

subject so persectly disagreeable, but remark that these are the men among whom drinking, wrangling, quarelling, fighting, ravishing, &c. &c. &c. are found, as in their native soil; once, to a degree that made them the pest of society; they are growing better, but even now, one or two of them, got by accident (where they have no business) into better company, are sufficient very much to aerange the pleasures that result from a liberal conversation. A new spirit; new sashions; new modes of politeness exhibited by the higher ranks are imitated by the lower, which will, it is to be hoped, put an end to this race of beings; and either drive their sons and cousins into the army or navy, or fink them into plain farmers like those we have in England, where it is common to see men with much greater property without pretending to be gentlemen. I repeat it from the intelligence I received, that even this class are very different from what they were twenty years ago, and improve so fast, that the time will soon come when the national character will not be degraded by any set.

any fet.

That character is upon the whole respectable: it would be unfair to attribute to the nation at large the vices and sollies of only one class of individuals. Those persons from whom it is candid to take a general estimate do credit to their country. That they are a people learned, lively and ingenious, the admirable authors they have produced will be an eternal monument; witness their Swist, Sterne, Congreve, Byle, Berkeley, Steele, Farquhar, Southerne, and Gold-smith. Their talent for eloquence is selt and acknowledged in the parliaments of both the kingdoms. Our own service, both by sea and land (as well as that unfortunately for us) of the principal monarchies of Europe, speak their steady and determined courage. Every unprejudiced traveller who visits them will be as much pleased with their chearfulness, as obliged by their hospitality: and will find them a brave, police, and liberal people.

The sections on the corn trade and linen manufacture contain much interesting information. The author's inferences and arguments appear to be built upon documents of unquestionable authority, taken from public records, or communicated by gentlemen of veracity and honour, many of whom being in office themselves, their communications ought to be considered as authentic. Mr. Young's reasonings on these subjects are much too complicated for us to give any succinct detail of them in the compass of the present article. Nevertheless, that our Readers may form some idea of this Writer's commercial opinions, we shall make no apology for laying before them the sollowing passage; and we the rather do it, because the indulgences lately granted to Ireland have awakened in some minds an illiberal and groundless jealously.

Relative to the other manutactures of Ireland, I am forry to fay, they are too infignificant to merit a particular attention; upon the subject of that of wool I must however remark, that the policy of England, which has always hitherto been hostile to every appearance of an Irish woollen manusacture, has been founded upon the mean contrac-

contractions of illiberal jealousy; it is a conduct that has been founded upon the ignorance and prejudices of mercantile people, who, knowing as they are in the science which teaches that two and ewo make four, are loft in a labyrinth the moment they leave their counting-houses, and become statesmen; they are too apt to think of governing kingdoms upon the same principles they conduct their private business on, those of monopoly, which, though the soul of private interest, is the bane of public commerce. It has been the mistaken policy of this country to suppose, that all Ireland gained by a woollen manufacture would be so much loss to England; this is the true monopolizing ignorance. We did not think proper to draw these bands of commercial tyranny so tight as to interdict their linens; we gave them a free trade; nay we import an immense quantity of Ruffian and German linen, and yet between this double fire of the Irish and foreigners has our own linen manufacture flourished and increased; it is the spirit and effect of every species of monopoly to counteract the designs which dictate that mean policy. The rivalship of the Irish (if a rivalihip was to ensue) would be beneficial to our woollen trade; as a fast friend to the interest of my native country, I wish success to those branches of the Irish woollens which would rival our own; a thousand beneficial consequences would flow from it; it would inspirit our manusacturers; it would awaken them from their lethargy, and give rife to the spirit of invention and enterprize. How long did our old broad cloth trade sleep in the West, without one fign of life strong enough to animate a new pursuit; but a diffesent spirit breaking out in Yorkshire and Scotland, new fabrics were invented, and new trades opened. A free Irish woollen trade would put our manufacturers to their mettle, and would do more for the woodlen trade of England than any other measure whatever. Our merchants think such a rivalihip would roin them; but do they think the French would not have reason for such fears also? Have we not Soft the Levant and Turkey trade through the obflinacy of our monopolists? And why should not Ireland have a chance for such a branch as well as Languedoc? But such has been our narrow policy, with respect to that kingdom, that we have for a century sat down more contented with the successful rivalship of France, than with the chance of an Irish competitor.

Whenever any question, relative to commercial indulgence to Ireland, has come into the British parliament, its friends have always urged the distressed state of Ireland as a motive. This is taking the ground of duplicity, perhaps of falsehood; they ought to be more liberal, and avow that their principle is not to relax the present laws as a matter of humanity to Ireland, but of right and policy to themselves; to demand a free trade to Ireland as the best friends to Brizain; to demand that France may be rivalled by the subjects of the British empire, if those of one kingdom cannot, or will not do it,

that those of another may.

One would have reason to suppose, from the spirit of commercial jealousy among our woollen towns, that whatever Ireland got was lost to England: I shall in a succeeding section insert a table, which will shew that, in exact proportion to the wealth of Ireland, is the balance of the Irish trade in savour of England. That kingdom is

one of the greatest customers we have upon the globe; is it good policy to wish that our best customer may be poor? Do not the maxima of commercial life tell us, that the richer he is the better? Can any one suppose that the immense wealth of Holland is not of vast advantage to our manusactures; and though the Russia trade, upon the balance, is much against us, who can suppose that the increasing wealth of that vast empire, owing to the unparalleled wisdom of its present empress, the first and most able sovereign in the world, is not an increasing fund in favour of British industry?

We cannot dismis this article without acknowledging our obligations to this agreeable Tourist for the information and entertainment which his publication has afforded us. We have met with little or nothing of that passion for theory and paradox in which this Writer sometimes indulges himself. The work before us never could have appeared at a time when it would have been more worthy the public attention than at pre-

fent.

With respect to England, her sister island is at this moment an object of political magnitude much greater than she has ever been, since the two islands were connected. With respect to herself, she stands in a predicament different in many respects from any that she was ever in before; as it will be entirely owing to want of steadiness and virtue if she be now prevented from establishing her claim to what seems to be the indisputable birth-right of all mankind.

Should Ireland obtain and make use of those privileges which her own interest and the real interests of this kingdom point out to her, she will soon feel the advantages of them in the internal improvement that will gradually extend itself through the most uncultivated parts of her territories. Mr. Young's book may then answer the most important purposes: by pointing out what she has been, and the wretchedness she has formerly experienced, it may teach her how to value the blessings that will then slow in upon her; and the picture it will exhibit of her past situation may give an additional relish to her present enjoyments.

E remember to have heard it remarked as a singular characteristic of a man of great eminence in the literary world.

ART. II. Fffays on the Trade, Commerce, Manufactures, and Fisheries of Scotland; containing, Remarks on the Situation of most of the Sca-ports; the Number of Shipping employed; their Tonnage: Strictures on the principal inland Towns; the different Branches of Trade and Commerce carried on, and the various Improvements made in each: Hints and Observations on the Constitutional Police; with many other curious and interesting Articles never yet published. By David Loch, Merchant, and General Inspector of the Fisheries in Scotland. 12mo. 3 Vols. 7 s. 6 d. Edinburgh printed.

world, that he was able in all cases to discover the reach of tai lents of those with whom he conversed, and to adapt the nature of his arguments to their capacity; with men who had accustomed themselves to reason closely, his arguments were clear, philosophical, and strictly logical; with those who were incapable of following a close chain of reasoning, he adopted a more popular and diffusive strain; and with others, whose mental faculties were of a meaner class, he descended still lower, fo as to adopt those arguments which alone were within their But few are the men who are possessed of this verfatility of genius, and therefore, in general, one man is only capable of making himself agreeable to one set of companions, who are nearly on a level, as to mental faculties, with himself; and his conversation is disrelished by all others, because his style of reasoning is either above or beneath them. It is happy for fociety, that in every case of great moment, authors of different talents address themselves to the public, each of whom discussing the matter in his own particular manner, adapts his reasoning to the capacities of those who are in the same class with himself: and as among mankind at large the class of accurate reasoners is very small in comparison with those who are incapable of investigating any subject with a philosophical precision, it usually happens that, in those disquisitions especially that are intended to engage the attention of the people at large, the best written book is not the most useful, as an inferior performance will more engage the attention of the multitude. Newton's Principia was not in general effcem, even among men of science, till it came to be explained in their own manner by persons of inferior genius: and, were it not an invidious task, we could furn sh a numerous list of books that have afforded materials for many a popular performance, which, but for these neglected originals, could never have existed. We only remark this, to shew with what infinite wisdom the affairs of the universe are directed. Winds, storms, birds and insects, scatter the feeds of plants upon the furface of this globe, where they spontaneously spring up for the sustenance of those animals which take no care for themselves; and the knowledge that is produced by the exertions of men of superior genius is, in like manner, happily diffeminated among mankind by the more feeble efforts of those whom nature has adapted to that inferior, though most necessary office.

The work before us is of that class which is merely adapted to the multitude. Instead of conclusions logically deduced from premises established on firm data, we meet with affertions uttered with great confidence. Nothing appears doubtful; and where it would be difficult to refute an opposing argument, the reader is overwhelmed with a multiplicity of words, which al-

though

though they may not convey any diffinct ideas, yet as they end in a way that is favourable to the hypothesis of the Author, a Reader of the class for which this work is chiefly calculated, believes that what he has been reading contains unanswerable arguments in proof of that hypothesis, and he remains entirely convinced by the Author.

Mr Loch feems to have a confused idea of many particulars relating to commerce and manufactures, which he throws together in chaotic confusion, frequently starting from one subject to another, where there is no apparent connection-and as frequently returning with equal disorder to the subject he had quitted. Our Author seems, however, to be possessed of abundance of zeal in the cause of his native country, and is no less vehement against the English for sending their manufactures to Scotland. We wish to see manufactures flourish in every part of the kingdom, and cannot help thinking, that little good can refult from inflaming the minds of the lower people in either part of the island against their brethren on the other side the Tweed.

Without attempting to give an analysis of this desultory work, we shall only observe, that the bulk of the first volume confifts of many arguments tending to prove that the linen manufacture is an unprofitable one for Scotland, and that the wooilen manufacture would be extremely profitable; in which we think he is right. This we had occasion to observe was demonstrated some time ago in another work relating to the manufactures of Scotland \*, from which performance our Author feems to have borrowed largely, without making the smallest acknowledgement for it . Indeed, his observations on the management of sheep are little more than a transcript of what Mr. Anderson has said, put into a different dress; intermixed with a few observations picked up from other authors, by whom he

Observations on the means of exciting a spirit of national indus-

try, &c. See Review, vol. lviji.

<sup>+</sup> Example. " It is a certain fact, fays Mr. Loch, that that part of a fleece which glows in the coldest season, or in winter, is infinitely finer than that which grows in the summer; and that these threads or filaments on any fleece are exactly proportional to the different degrees of the temperature of the air, or the variations of heat and cold in the dist & in which the sheep are reared." In our Review, referred to in the above Note, we detailed the experiment by which this curious fact was first demonstrated, and the uses to which it might be applied. A fact that does not feem to have been attended to by any one before these experiments were made. See also a Note. p. 170, of Mr Loch's work, which is almost literally taken from Mr. Anderson's book, as transcribed into our Review.—Many other examples might be given.

is frequently misled, or bold affertions of his own, that too often stand in need of proofs to establish them +: interspersed with strokes of humour and wit, of his own style, that may perhaps divert some Readers, though it may not convince their

understandings.

But although we cannot say much in favour either of the originality or the elegance of this Writer, yet many observations incidentally occur in this miscellany (for such it might have been with propriety named) that are curious, and deserve attention. Among which is an account of the manufastures of Paisley, surnished by an anonymous writer, who seems to have been very well informed.

The second volume of these Essays contains observations by the Author on the different manusacturing towns in Scotland, made in a tour undertaken by him in quality of General Inspector of manusactures and fisheries: with the journal of a traverse among the Western Isles during the fishing season,

in 1778.

From the first part, we are happy to see that the numerous infant manusactures in Scotland are in a much more promising state than we had apprehended, and that industry is coming more and more into sashion in that part of the island. We heartily wish the gentlemen of landed property in that country may continue to give every encouragement to these manusactures, and that the legislature may in suture bestow a greater degree of attention to the improvement of Scotland than it has hitherto obtained: for undoubtedly the prosperity of that part of the nation will contribute more to its internal desence than that of any distant colonies ever can do. In this respect we agree in opinion with our Author,—nor do we hesitate to pronounce, that the spirit of colonization has been the hobby-

<sup>†</sup> Example. "They (the Highlanders), says he, p. 21, are also endeavouring to mend their breed (of sheep) by adopting the example of the nobility and gentry; who, to effect this, have spared no expence to import tups of the best kinds from the above-mentioned gentlemen (viz. Messrs. Bakewell, Chaplin, and Culley), by which means they have now sheep, which instead of two or three pounds of coarse wool, yield eight or ten pounds of sine wool; and in lieu of mutton of six and seven pounds per quarter, now sixteen and eighteen pounds—and yet these very sheep do not require a sist part more food to support them than the hungry half-starved breed of this country." Let this sact be sully proved, and we will undertake that in a very few years not one of the old breed of sheep will be sound in the country. Again, he observes, p. 12, "for hairy sheep, transported to rich passurage, will cause the wool to grow much siner, and contrari-wise."

horse of Europe for a century past, and has been productive of much national distress. But the time is not perhaps yet come when the force of this observation will be fully felt.

Will it be believed, in future ages, that Britain has exhaused her treasury for more than a century past, and thrown out every alluring bait that could be devised, to induce the natives of her own island to relinquish their habitations, and migrate to distant [defert] countries, where they stand in perpetual need of support from the weakened state, instead of strengthening it-and all this without enquiring whether it was possible to convert the labour of these persons at home to any more valuable purpose? Can it be believed, that a nation not absolutely stupid should have gone thousands of leagues in quest of fishing groundsshould have peopled a barren unhospitable island, and undertaken two expensive wars to obtain possession of that fishing ground, without so much as sounding their own coast, to see if any thing of the same kind could there be found, even after they had received the strongest intimations that it might? Yet, aftonishing as this may appear, it is undoubtedly true: - and, whether the observations of our Author on the number and magnitude of the fishing banks on the West coast of Scotland, may turn out as he imagines, or not, still we are inexcusable in not having, long ago, explored them with the utmost care, so

as not to leave room for a doubt concerning them.

From the whole train of our Author's observations on the fisheries, it is evident, that he means to magnify every advantage that his nation enjoys in that respect as much as possible.— We are forry that our scanty limits forbid us to enter into this discussion so fully as we could wish. We could, but for this objection, have been glad to collect together several interesting facts relating to the subject, that are scattered through the volume before us, so as to place them in one conspicuous point of view.—Would the nation be at the expence of fending a man of genius and public spirit to that part of the country, to collect facts and make observations on the spot, who could be capable of judging of the expediency or non-expediency of the measures that should be pointed out by the natives and others whom he might there meet with, who had frequented these seas, and who could arrange his ideas in a clear and perspicuous manner, we are persuaded that the observations of such a person, made public, would be of much more national advantage than the difcovery of a Southern Hemisphere, and might be accomplished at less than the thousandth part of the expence of an expedition to Otaheite. In the mean time, we recommend the journal of this Author to the attention of our countrymen—as it may serve to excite in them a defire to explore these unknown regions, in which we are happy to see that the fishings are beginning to be

attended to by the natives, although the laws are little calculated to promote their industry. We hope the time is fast approaching when this great national object will obtain a more unbiassed degree of attention from all ranks of people, than has hitherto been bestowed upon it \*.

The third volume confifts of some general observations on trade—on some of the manufacturing towns in England—on the police of the city of Edinburgh—on the trade to Campvere—on the canal between Clyde and Forth—on the advantages of making a navigable canal through the peninsula of Cantyre—on the trade to Ireland; with some smaller articles: to which is added a supplement, containing the Author's thoughts on the means of quieting the rebellion in America, which seems to have no other claim to a place here but that of filling up a part of the volume.

On all these subjects, persons who are unacquainted with them may receive some information.

Auricola.

<sup>•</sup> The following inflance of industry and attention in a Mr. Campbell of Loch Goyl, deserves to be particularised, as it tends to show that the natives are neither so stupid nor indolent as they are commonly represented:

<sup>&</sup>quot; I dined, says Mr. Loch, vol. ii. p. 225, with the reverend Mr. M'Lea, who told me in the course of conversation, that Alexander Campbell, one of Ardkinglass's tacksmen or farmers, had great merit in fishing the head of this loch; that he had, within these four years, encreased the number of his boats and nets as fix to one; and that most of his fishers came over to him at the proper season from Nairn. This information excited my curiofity to be fully acquainted with their mode of payment, the nature of their fishing, and to what market the fish were tent for fale; upon which I was told, that Mr. Campbell provides boats, nets, lines, and every material for fishing, and allows his fishermen one half of the fish caught for their trouble. Mr. Campbell has contrived nets with which they catch falmon, cod. feaths, feals, haddocks, and many other kinds of falt water fish, and mackrel when in season, in vast quantities. Nay, so great has been their success in this last kind, that they have often caught from 3.00 to 5000 at a draught, the market for which, as well as the others, is principally Glasgow, Paisley, Greenock, &c.; and the very innabitants themselves, who often assist the fishermen in hauling their nets on shore, when heavy loaded, are most generously rewarded by Mr. Campbell, who gives them as many fish as they can carry home for the use of their families." This is acting with a liberality of spirit that shows Mr. Campbell is capable of forming extensive views of trade and manufactures. We heartily wish him all the success his industry deserves, and are glad to see that his laird is not intensible of the value of such a tenant.

ART. III. Three Discourses. I. On the Progress of religious and Christian Knowledge. By William Enfield, LL.D. II. On religious Zeal; with a comparative View of the Protestant Diffenters of the last and present Age. By Richard Godwin. 111. On the Character, Osfices, and Qualifications of the Christian Preacher. By Philip Holland. 8vo. 3s. 6d. Boards. Johnson. 1780.

E are informed, in the Preface, that the Discourses here offered to public attention, were, in substance, lately delivered on occasions on which a considerable number of distenting ministers were affembled; and that the Authors are so nearly agreed in their general views, that they wish to appear in the world as friends united in the support of an important common cause.

The leading objects of these Discourses are to encourage free enquiry, and to excite an active but temperate zeal for the great interests of rational Christianity. The Authors are particularly careful to guard against the satal extremes of infidelity and sa-

naticism—bigotry and indifference.

The first Discourse, by Dr. Enfield, is sensible and ingentous. The Author traces with judgment and candour the progress of religious knowledge through its various gradations, and amidst the obstructions which ignorance or policy, pride or interest, superstition or enthusiasm, have from time to time thrown

in its way.

The testimony which the Doctor hath borne to the high merit of the Polonian brethren, who assisted Socious in perfecting his daring system of reformation, will perhaps be objected to, as partial, if not extravagant, by some of our Readers. We will transcribe this singular passage. Soon after the first dawn of the Reformation, several great men arose who possessed such strength and acuteness of understanding, and freedom of spirit, as to be able, at one effort, to separate the pure religion of Christ from the mass of absurdates and superstitions with which it had been mixed; and to conceive themselves, and to represent to others, a system of faith so rational and scriptural, that all the labours of modern times have done little to improve it.

It must indeed be acknowledged, even by the most bigotted adversaries of Socinianism, that its first sounders were men, not only of uncommon fortitude, but of great erudition and distinguished abilities. And it would be the height of prejudice not to allow them even higher praise than is due to their literary endowments. They are entitled to that praise which is the just reward of an unyielding integrity, and of the purest and most amiable virtues that could adorn the characters of men and Rev. Sept. 1780.

N Christians.

Christians. It is not our business to decide on the truth of their theological system. But they had that merit which all can judge of—founded on universal principles, and directed to the

common interests of religion and morality.

Dr. Enfield justly considers the good work of reformation as having been chiefly retarded in its progress by two causes: First, The appointment of subscriptions to articles of faith, as the term of admission into every national church; and secondly, The propensity which hath always prevailed among the vulgar, to prefer a religion, which either captivates the senses and imagination, or agitates and enflames the passions, to one which is immediately addressed to the understanding and the moral principle, and hath no other object than to make men wise and virtuous.' To the former may be referred every species of hierarchical domination, with their mischievous effects in enslaving the minds of men, and producing an illiberal timidity in the priests, and a blind submission in the people—to the latter may be traced up all the various absurdities which have been generated between folly and fancy:—mysticism with its "moping melancholy," and enthusiasm with its "moon-struck madness."

The Doctor congratulates his brethren on the prospect of the advancing power of "pure and undefiled religion." He mentions some auspicious appearances of its progress; and kindling with his subject, he gives sull scope to the generous wishes of his heart, till what he wishes he imagines he foresees. 'Yes (says he), I will foretel (and may it please the great Lord of Nature to sulfil the prediction!) that the cloud which was once "no bigger than a man's hand" shall at length spread over the whole heavens, and water every region of the earth with the dews of heavenly wissom:—and that the whole earth shall be one holy temple consecrated unto the Lord.'

The second Discourse, by Mr. Godwin, contains a variety of judicious reslections, and breathes an amiable and truly Christian spirit. The zeal which he recommends is persectly consistent with the charity he prosesses; and both are happily allied with that "wissom which cometh down from above, which is first pure and then peaceable; gentle and full of good fruits." The Author hath nothing of that little spirit and those low views of party which would confine all truth and all virtue to its own circle. His objects are equally liberal and important. He wishes to excite his brethren to that manly zeal which wastes not its force on those theological tristes and absurdities which have so long disgraced the controversies of the Christian Church, but which directs its influence to the most important and essential interests of mankind, and would restore the Christian religion

to its primitive simplicity, unencumbered with needless ceremo-

nies, and unobscured by incomprehensible mysteries.

The bigots to Puritanism will think he hath sketched the picture of the old Nonconformists with too free a pencil, and will accuse him of a want of duty and natural affection to his forefathers, by exhibiting them with such a harsh outline, and with fuch unpleasing features. 'The diligent and impartial inquirer, however candid, must acknowledge that the Protestant Dissenters, in less time than even half a century past, were in general auftere in their temper and manners; that they painted religion with a gloomy aspect; betrayed a spirit of singularity and opposition in trifles; were excessive and almost indiscriminate in their invectives against pleasure; laid too much stress upon modes and opinions; made too little allowance for human infirmities; fixed too high a value on long and frequent retirements for the fake of devotional exercises in private; placed as much too low the standard of the moral virtues, those especially which are humane, generous, and of all others the most engaging; confined almost all their approbation and good-will to the people of their own feet; discovered an over-weening conceit of their own spiritual attainments; and—what is still worse than all the rest!-that there were undoubtedly instances of those who put on the semblance of rigorous piety to atone for, conceal, and give success to heinous immorality.—It is with all readiness acknowledged, that there are upon record many exceptions to this heavy charge; but the above mentioned may, I think, be exhibited as some of the principal outlines in the . character of those who were, or affected to be, amongst the best and most religious persons of the last age. Nay, further, if a diligent and impartial inquiry were now made into the prevailing temper of large bodies of Protestant Dissenters in several disferent parts of this kingdom, it would be found that something of the same spirit is still remaining amongst us.'-This is bold speaking in a Dissenting minister. But truth and integrity beget courage. We have only to remark, that when the wound is deep and dangerous, the probe must not be held with a timid and trembling hand.

We can only speak in general terms our approbation of Mr. Holland's Discourse, having no room for extracts. It may be thought too prolix: but it contains some excellent and valuable remarks on the great principles of natural and revealed religion, and offers some important advices to ministers with respect to their intellectual qualifications and moral character; their pri-

vate studies and public duties.

ART. IV. Four Elegiac Tales. 4to. 29. 6d. Flexney.

THE Elegiac Tale is a species of composition in which it is not so easy to excel as at first view might be imagined. The narrative is required to be not only simple, but interesting; the versification, at the same time that it is familiar and concise, should also be elegant and harmonious: and over the whole must be diffused that plaintive tenderness which slows from native sensibility. If the poems before us be examined by these rules, they will not be found destitute of merit. In the choice of his subjects the Author has been peculiarly happy.—His narrations are unfolded with ease and perspicuity, and the sentiments with which they are embellished breathe the true spirit of elegy. In the construction of his verse also, if allowance be made for some little hardness of manner, he will not be thought Arikingly deficient. Where he has failed in point of verlification, we attribute the failure in great part to the confinement of his measure; which, notwithstanding some respectable attempts, has seldom of late succeeded. Well as the stanza of eight and fix syllables alternately might be adapted to the unadorned simplicity and nakedness of the ancient ballad, it leaves not scope enough for that ornament which is looked for in more modern compositions. To avoid simplicity (we mean in its less respectable sense) on the one hand, and stiffness on the other, is what few who have adapted this measure to narratives of any length, have ever been able to compass. Of this writer's success the Reader will form his own opinion from the following extract from Bertram and Matilda, the second tale in this collection.

"The morning drinks my husband's blood:
"Go page (Matilda cries)
"Haste to the holy Anselm's cell
"And bid the hermit rise."

He came—but when with hands uprais'd, And kneeling on the ground, Bent o'er her sleeping babe in tears The forr wing fair he found;

With kindred forrow torn, long time
The rev'rend hermit stands:

*R* .

44, Say, lady, whence thy grief? and why
45 To Heaven these listed hands?"

"The morning drinks my husband's blood:
"By doom unjust he dies;
"Bound in the dungeon's dreary cell,
"The prison'd Bertram lies.

" Oh, father! by our Saviour's cross " Which guards thy holy breaft!

" By him, whose bosom bled for all " Receive my sad request!

" Grant in thy sacred garb disguis'd, " To feek the dungeon's cell,

" Receive a husband's kifs of death, " And figh a last farewel."

" Yes! lady, take my hermit's dress,

"My pray'rs, and bleffings take;
"The Pow'r whose bosom bled for all " Shall ne'er thy truth forfake."

Veil'd, in the rev'rend father's hood She fought the prison round.

"Tis Bertram's flinty bed, and fast " His eyes in sleep are bound-

" Is this the bed of guilt? - Such rest " Ne'er sooth'd a traitor's sense;

" Such is the rest of virtue, such " The fleep of innocence."

Awak'ning, by the glimm'ring lamp, He saw the father stand-

And thrice he kis'd th' extended cross, And press'd the trembling hand.

"Oh, father! mourn not o'er the scene, " Which soon in death will close;

" Mourn, where each length'ned hour of life, " Prolongs a widow's woes.

"Watch o'er an orphan child, and foothe "A mother's grief to rest."

-Matilda clasps her Bertram's neck! She funk upon his breast!

. 7

" Thy hour of death is mine!-I come " Resolv'd to share thy doom.

" The morning's light, which sees thee fall " Shall guide me to the tomb.

"Oh! by our tender pledge of love, " Avert the dire defign!

" Our joys were one—one be our fate—
"Thy hour of death be mine."

At day-break, from his bed, enrag'd The warchful Richard flies;

" Lead out the victim, to his fate, " B'en now, the traitor dies."

Encircled by the murm'ring croud, The monarch press'd the throne; No eye, save his, resus'd a tear, No breast, save his, a groan, N 3

When

When flow, the sad procession mov'd.

The minister of sate

Came first; his right-hand bore alost

The ax's ponderous weight.

The hermit next, wrapt in the hood,
With falt'ring footsleps went;
His arms were crois'd, low towards the earth,
His looks were downwards bent.

Bareheaded last, with mien erect
The dauntless Bertram came,
Unmov'd he gaz'd on all, no fear
Could shake the warrior's frame,

"New strike the blow."—Firm on the block
His guiltless neck he laid;
The naked ax, uplisted high,
Hung trembling o'er his head.

" Hence vain disguise," Matilda cry'd,
" One little moment stay!"
With eager haste, she instant cast

The friar's garb away; Down her white breasts, that wildly heav'd,

Her hair luxuriant hung;
Now firike the blow!" o'er Bertram's neck
Her fnowy arms the flung.

"One death shall end us both!"-" No, live"
(The wond'ring Richard cries)

"To life, to liberty, to fame,
"Thy monarch bids thee rife."

C.K.t.

ART. V. An Ode. Pindarum quisquis studet amulari. 4to. 18. 6d.
Dodsley. 1780.

RIDICULE has been faid to be the test of truth.—When applied to the principles of shafe and applied to the principles of those who make use of it, the observation is, in some degree, just. The province of ridicule is to laugh at vanity, affectation, folly, or absurdity; and to expose incongruity and imposture. When, therefore, it is employed in pulling off the malk from hypocrify, or in detecting the dangerous delusions of fanaticism, it is then, no doubt, properly directed; but to attack, by the means of this weapon, the foundations of religious obligation, even though religion were a mere human institution, is to proceed upon false principles, as the attempt then is to destroy what has the peace of society and the happiness of individuals for its object. To stigmatize the blunders of ignorant statesmen, or the pretended patriotism of defigning and interested demagogues, comes, in like manner, within the province of ridicule; but to represent every mode of government as contemptible, and to consider all public virtue as allumed

An Odei

assumed for the purposes of private emolument, is to forget its legitimate object, and to act upon the false and pernicious supposition, that all men are fools or hypocrites,—a supposition that, in the end, must introduce either anarchy or despotism.

The same mode of reasoning may be extended to ridicule, when applied to the elegant arts. Its objects, in this case, are the pretenders to knowledge, or the perverters of it; those who assume to themselves an excellence they do not possess, or who, endeavouring to excel by unnatural efforts and affected peculiarity, overleap the modesty of nature. But to laugh at the bold conceptions of a comprehensive and elevated mind, merely because we ourselves are unequal to such exertions, argues not only a want of true principles of taste, but implies also a mean and malignant envy, that would bring down others to a level with ourselves.

The empty fashion of the day, to turn every thing serious into jest, has led us into these remarks: and let us add, there is no fashion that brings with it a more unerring and lamentable

proof of general depravity.

The present Writer, suiting his composition to the complexion of the times, has chosen the serious Ode for the butt of his buffoonery; but, unfortunately, the little joke that he intended is lost, as it certainly has no proper object. The attempts of unsuccessful scribblers are beneath notice, and the sew effusions of real genius, that have had the stamp of public approbation, though obnoxious to parody, are not open to burlesque: desective neither in sense nor connexion, and without any incongruous mixture of dignity and meanness, they have no unnaturally prominent seatures for ridicule to lay hold of. Do they ever introduce a sarrago of heterogeneous ideas and quaintnesses of expression, that can in any degree be resembled by "Morning's saffron-coloured gown, and her head-dress of pink and pea-green ribbands, of celestial staircases, and gilt balconies, fruit-trees with vast white perriwigs, &c."—But enough of this foolery.

Though this Writer cannot boast the most dexterous method of wielding the weapon he has assumed, that he knows, however, how to write a *Dedication*, is evident from the following compliment to Lord Carlisle, to whom he addresses his poem: The very few pieces, says he, with which you have favoured the Public, are as elegant and beautiful as any in our language.

Of the poem itself take the following specimen:

Hail, Liberty, fair goddess of this isle!
Deign on my verses, and on me, to smile;
Like them unfetter'd by the bonds of sense,
Permit us to enjoy life's transient dream,
To live, and write, without the least pretence
To method, order, meaning, plan, or scheme;

And

And shield us safe beneath thy guardian wings, From Law, Religion, Ministers, and Kings.

It is difficult to say, whether this Writer's political principles are more liberal, or his mind (witness the Dedication) more ingenuous, than his literary taste is classical and just.

ART. VI. Russia: or, a complete historical Account of all the Nations which compose that Empire. 2 Vols. 8vo. 10s. sewed. Nichols. 1780.

Whether it be an original or a translation, who is the Author, and on what authority his affertions are built, are particulars concerning which we receive not any information. Yet if this anonymous Writer had intended that his publication should acquire any credit with the world, he ought to have been at some little pains to satisfy the reasonable curiosity of his Readers; but as he has not thought sit to take this trouble, we are obliged to estimate his Work by its own intrinsic merit, and to be contented with such discoveries as may be made by internal evidence alone.

The first volume contains an introduction giving an account of the Siberians, together with what the Author calls a complete history of the Finnish nations. It would not, we apprehend, be very entertaining to enter into any minute detail concerning the Kara-Kitans, Tsongares, Tscheremisses, Tschou-wasches, Terptyaireis, and Votiaks, whose manners and customs are described with an appearance of laborious accuracy in this superlatively dull and tiresome performance. The Author feems not to us to possess any very clear idea of the duties, and requifites, of an historian. He knows not how to select from the great mass of materials which his subject affords, those particulars which are worthy of being laid before the public. He describes with a tedious minuteness circumstances of the most frivolous nature, and passes slightly over matters of the highest moment. The events which he relates stand altogether unconnected with each other, or with any general plan. He enjoys not in any degree the faculty of interesting the Reader in the subject of his narration; and as to the power of generalising his ideas, of tracing out their mutual connection or dependence, and thus making the customs and usages of the different nations which he describes throw light on each other, these are matters which lie far beyond his reach, and which he possesses neither the means to execute, nor even the capacity to comprehend. We should be glad to insert, as a specimen, some passage that might entertain our Readers: but such a passage we have not

been able to discover in either of the two volumes. We shall therefore take the liberty of laying before them a chapter relative to the Lettonians, &c. recommended only by its brevity.

The Lettonians, the Estonians, and Liess, inhabit Liessand, or Livonia; the former make also a part of the inhabitants of Courland. Estonia, or Estland, and Livonia, bear the name of their inhabitants. They have all an affinity with one another; but make not one nation. The Lettonians are of the same race with the Lithuanians and the ancient Prussians; that is to say, descended from the Sclavonians and Finns.

At the beginning of the thirteenth century they formed themfelves, by degrees, into a nation, near the mouth of the Visula, and
have fince expanded themselves to a wider compass. Three parts
out of four of their language is composed of Sclavonian terms, and
the rest of Finnish origin. The Estonians are less mixed; and the
Liess, as well as the inhabitants of the isle of Cesel, are simply a
branch of Finns. Their Finnish dialects differ in the same degree,
and that so conspicuously, that every one of them is at length become
a language by itself. These three nations are usually consounded by
the Germans under the name of Undeutsche, which signifies NouGermans, and comprehends them all. If any one should chuse to
derive the name Lettonians from the word Lada, or Leide, which signifies to root up, or break up land, it would not be more destitute of
probability than many hundreds of derivations daily imagined. They
have been cultivators of the ground from all antiquity.

When they less their situation on the Vistula to settle in Livonia, about the middle of the thirteenth century, the Finns, who lived chiefly by their flocks, and neglected the culture even of their arable lands, were not at all averse to the union; for the Lettonians immediately set about clearing the ground; and, by the preparation of that sort of manure which is made by burning the trunks of trees and bushes in the field, spread themselves so, that they obliged most of the Finns to retire. But such as chose to remain, adopted a life of agriculture; and this method of manuring is universal among them to this day. About the same period, the Knights of the Teutonic order having completed the conquest of Courland and Livonia, all the inhabitants of these two countries were converted to Christianity, and declared the slaves of this foreign nobility, who took them as their property, and have kept them as such ever since.

In their stature and whole exterior the Lettonians differ; but, in general, they are very like the Finns. Great numbers of them are of a phlegmatic and melancholy disposition. Except life itself, and the pleasures of love, every thing in the world is indifferent to them. The oppression they groan under, poverty, a hard education, and their general constitution, have inured them to the severity of the climate, want, and submission. They are of a phlegmatic temperament, idle, silthy, and addicted to drunkenness. They are not, however, destitute of capacity. Their women seel not so severely the hand of oppression as the men; and are not without a share of beauty and vanity.

Their villages are small, and their habitations dirty. Their houses are little huts made of baulks, placed upon one another, and fastened

fastened together by notches at the corners. This is the common. architecture of the people of all these parts of the North. A peasant wants nothing but timber and a hatchet to build his house . The habitations are small, but warm, and suited to the climate, as being easily heated in the sharpest winter. Their little villages are distributed about the estates of the nobility to whom they belong. food and furniture indicate the greatest indigence. Those whom their lord does not take into his immediate service, have a little field or meadow, with some cattle to procure a fort of subsistence from. The time, however, to look after it must be subtracted from their fleep, the day being scarcely sufficient to till the ground of their lord, repair the buildings, fences, and other works, which they do for the most part as a commutation for taxes. The women sew, and do other works which they are obliged to carry to the lordship. The do other works which they are obliged to carry to the lordship. Lettonians seldom give themselves any trouble, because their masters are obliged to maintain them without it. Such of them, however, as live under a mild proprietor, know how to turn the gentleness of their master to their own account, and often get a great deal of money: but they commonly defraud the community of it, by burying it in the earth.

The men dress themselves like the Finns, excepting that they do

not all wear their beard.

The dress of the women is very pretty, and has some resemblance to that of the Sclavonian women. They wear stockings, shoes or slippers, white shifts with sleeves very full towards the shoulder, but close at the wrist. They wear the common gown of semales, with long aprons, and a kind of boddice which comes down no lower than the petticoat. They wear a necklace of glass beads, which falls down likewise on their breast; and, being composed of a number of rows, serves as a tucker. The sides of the sleeves are worked or pinked, and the boddice is made of a party-coloured stuff, or of linen worked with various colours. The bottom of the petticoat and apron is adorned with a border sive inches wide, made of another stuff, or of a different colour from that of the petticoat. Sometimes there are many borders all alike, except in size, round the petticoat. They have a girdle likewise prettily worked, and sastened above the hips.

Married women are distinguished from maidens only by the headdress. The former wear little caps to the shape of the head, of several colours, and ornamented with gold or silver lace. They six to these caps behind a cockade, from which descend a number of ribbons and strings of various colours, which wave upon their shoulders. Maidens do not wear the little under-cap, but have a stiffened circlet on the top of the forehead, covered with gold lace, raised in front, and tied behind with cockades of different colours, the ends of which, being about six inches in length, fall upon their loose hair, like the

ribbons of the married women.

'These people were first converted to the Christianity of the Church of Rome: but force had more influence than conviction on their conversion. About the middle of the fixteenth cen-

Except moss, with which he crams the interflices against the cold,

tury they were converted from Popery to the profession of the Lutheran faith. Some merchants of Bremen laid the first foundations. of Christianity among them; the Knights of the Sword contributed to it rather by their arms than their arguments; and those of the Teutonic Order brought it to perfection. When their Pagan religion was at its height, the documents of it were only preserved by oral tradition: it is therefore no wonder, that, after fo long an abrogation of its tenets, we should now be so much in the dark about them. However, besides the ignorance with which they hold the dogmas of Christianity, such a supersition predominates among them, that the vessiges of Paganism are easily traced. It was, without doubt, exactly that of the Finns and Laplanders. With the latter, they named the Great First Cause, Journala, and Thor; believing that the properties of the divinity, as well as the phanomena of nature, were subject to him as so many inferior powers. They called the devil Vels; and ghosts or damons, Raggana. Grieva was the title of their high-priest, who was at the same time their temporal sovereign.

The above specimen sufficiently proves that, corresponding with the other impersections of this work, the style is low, vulgar, inaccurate, exhibiting in many parts the appearance of a bad translation written by a foreigner, or of a pen long unpractised in its native language \*.

\* From the year 1732 to 1776 feveral Russian academicians were commissioned to travel through the remote provinces of this extensive empire; some of whom published their journals; particularly Messes. Pallas and Gmelin. Of these journals an abridgment was made in the Russian language, of which, we are told, the present work is a literal translation. But as we have not ourselves seen this abridgment, we have avoided to mention it in the text.

ART. VII. Letters on Iceland: containing Observations on the Civil, Literary, Ecclesiastical, and Natural History; Antiquities, Volcanos, Basaltes, Hot Springs; Customs, Dress, Manners of the Inhabitants, &c. &c. Made ouring a Voyage undertaken in the Year 1772 by Joseph Banks, Esq; F. R. S. assisted by Dr. Solander, F. R. S. Dr. J. Lind, F. R. S. Dr. Uno Von Troil, and several other literary and ingenious Gentlemen. Written by Uno Von Troil, D. D. First Chaplain to his Swedish Majesty, Almoner of the Swedish Orders of Knighthood, and Member of the Academy of Sciences at Stockholm. To which are added, the Letters of Dr. Ihre and Dr. Bach to the Author concerning the Edda and the Elephantiasis of Iceland: Also Professor Bergman's curious Observations and chemical Examination of the Lava and other Substances produced on the Island. With a new Map of the Island, and a Representation of the remarkable Boiling Fountain, called by the Inhabitants Geyler. 8vo. 5 s. sewed. Robson, &c. 1780.

HIS very curious island, which, within a small and almost inconsiderable space, freezes with the utmost rigour, and burns

burns with all the violence of the most intense stame, has hitherto been little visited by persons who were capable of giving a scientific account of its productions, or disposed to exhibit an impartial view of its history. It has been supposed by many judicious cosmographers to be the Thule of the ancients; the title of Ultima best agreeing with its situation: and the several accounts that are given of the inhospitableness of the country, and the extreme rigour of the climate, have been produced as conwhich some ancient writers maintained of Thule, was the most extravagant that fancy could conceive: for regarding it as the extremity of the world, their imaginations ran riot in conjecture, and every thing strange and out of the common course of nature was supposed to be collected in Thule, and to exist there as in a common receptacle of confusion, prodigy, and "chimeras dire." Some affirmed, that there was no day beyond this magic island; and improving still farther in the art of exaggeration, Pytheas, in Polybius, affirms that all the elements were here jumbled together in a confused and heterogeneous mass, without any distinction of water, air, or earth (αλλα συγκριμα ]ι εκ Ιθίων), but a mixture of all, like the primitive chaos of the poets.

But leaving the dispute respecting the fituation of Thule to others who have more patience than we have to investigate an unimportant inquiry through the dark and doubtful labyrinths of antiquity; we shall confine ourselves to the history of sacts; and we are happy to be under the direction of so good a conductor as the learned and ingenious Author of the present pub-

lication.

tion hath been very considerable; though from the ravages of the plague and small pox the inhabitants are now reduced to about fixty thousand. The waste occasioned by the former in the beginning of the 15th century (called in the Icelandic Annals the Black Death) is almost incredible. Its effects on the state of the country were association, and produced almost a new seene of things, and a new revolution in its political and moral history.

Iceland hath long engaged the attention of the Danish Powers: but their attention hath not always contributed to the welfare and happiness of that country: for they have not been content to leave those poor islanders to the enjoyment of their frozen deserts and burning mountains, without the oppression of

taxes and the fetters of a monopoly.

Their mosses and grasses, of which their Flora chiefly consists, have been long ago to fully examined, and so regularly classed, by botanists from the school of Linnzus, that we are credibly informed that Mr. Banks and Dr. Solander found only a small

**species** 

species of grass which had eluded the attention of former travellers; and that even this was suspected to be rather an acci-

dental variety than a distinct species.

Amidst all the complicated horrors with which this country abounds, it hath however been the feat of the Muses. Icelandic poetry hath been much celebrated for the boldness of its images. and a certain wildness of sentiment and manner strongly characteristic of sublime but uncultivated genius \*. The celebrated Edda, which consists in a great degree of a collection of rules for the structure of Icelandic verse, with examples to illustrate them, was produced so early as the beginning of the 13th cen-

In the 11th century Christianity was introduced amongst the inhabitants of this island: schools were erected soon after; and claffical knowledge had made a confiderable progress in the 12th

century, even in this unpromising region.

Their histories and genealogies are the most ancient writings of the Icelanders which have reached the present times; they were the productions of the 12th century, and they relate the lives and actions of feveral of their more renowned chiefs, with an openness and candour which interest our feelings, and demand our credit.

In the 14th century, literature declined in Iceland, as well as in various other parts of Europe; and again raised its head under the auspices of the Reformation. Soon after this great revolution in the ecclefiastical and literary world, printing-presest were introduced and established in Iceland, schools were again erected, and every circumstance promised fair to restore this country to its former distinction in the scale of learning. Iceland, however, though by no means an illiterate country, cannot with propriety be called a learned one; and we need not be long in inquiring into the reason, when we observe the effects of despotism at a small distance from the immediate view of the

· A small specimen of scelandic poetry (not very sublime) may be

monarch.

feen in our Review, vol. liii. p. 593.

† Dr. Von Troil informs us, that a printing-office was established in Iceland about the year 1530 by John Mathieson, a native of Sweden. The Icelandic Bible was printed in 1584. This office was established at Hoolum, or Hola, in the North part of the island, and within the Arctic Circle. In Messrs. Bowyer and Nichola's Essay on the Origin of Printing, the date of this admirable art in Iceland is placed no higher than 1612, as they were unacquainted with any books printed there besore that period. Mr. Bryant speaks of a small treatife, which is in his possession, and on which he appears to fet a high value for its antiquity, that was printed at Hoolum in 1612. It was written by a native of that country, Arngrim Jonas, and is the book referred to by the learned Printers above mentioned. Rev.

monarch. In fuch circumftances, we cannot expect to find the people possessed of quick and lively talents; they are hardly content, and seldom cheerful. Historians and travellers agree in representing them to be of a serious and sullen disposition, who gather the little amusement their temper and situation qualify them to enjoy, from hearing the histories of former times—a period of independence to which they look back as to the golden

age of Iceland.

The great natural curiofities of Iceland are the volcanos and hot springs, which abound in the country, and present objects to the philosophical traveller equally amusing and astonishing. This island hath suffered very much from earthquakes: and the ravages occasioned by hurricanes and tempests have been great. Formerly there were confiderable woods in Iceland: but at prefent they are reduced to a small number: and trees, which once were the produce of the island, never grow at present to a greater height than twelve feet, and in thickness seldom exceed three or four inches. To the storms which so violently rage in this country of desolation, and the blatting influence of those immense shoals of ice that float thither from the shores of Greenland, Dr. Von Troil attributes the scarcity of wood; which may be very true with respect to the cousts, in particular. Agri-· culture is also greatly checked in Iceland by the very severe frosts, which frequently fet in so early as May and Junc. of this and other northern countries hath certainly increased fince the time that fir-trees flourished in Iceland. One cause of this increase of cold may be the yearly accumulation of the The eastern shores of Greenland (now floating ice-islands. called East Greenland by some geographers) were formerly inhabited by a colony of Norwegians, who had an episcopal see established among them. Ships formerly failed to this coast from Iceland, as well as from the continent; whereas, at present, it · is totally inaccessible, and hath been so for a number of years, on account of the immense masses of ice that are found there, and entirely obstruct the passage from the western coast of Iceland to the eastern coast of Greenland. Are Frode, a very antient writer of Icelandic annals, says, "That at the first landing of the Norwegians (toward the conclusion of the 9th century) on Iceland, they found it covered with woods and forests in the space between the shores and mountains."

The cold occasioned by the vast masses of ice that float near the shores of this island, is sometimes so intense, that both man and beast fall a facrifice to it.

The bears which arrive yearly with the floating ice, commit great ravages, particularly among the sheep. The government takes every possible method to encourage the natives in destroying these animals, by paying a premium of ten dollars for every

bear

bear that is killed, and in purchasing the skin, of him who killed it.'

The houses of the inhabitants are small, and inconvenient: their employment is sowling, fishing, and spinning. They are not much acquainted with the use of money; but their taxes are paid, and their barter settled, by ells of coarse cloth (called by the natives Wadmal), and by sishes; two of the latter being judged equivalent to one of the former.

Their diet is similar to that of other northern nations, and consists chiefly of dried fish, sour butter, and a flour made by

the moss which the botanists call Lichen Islandicus.

We have given this general sketch of Iceland from the work before us, rather to excite curiosity than to gratify it. There are many important and striking particulars in it, which will equally contribute to entertain and instruct its Readers. We have hitherto known little of this very curious spot; but have been contented with the partial accounts of Horrebow, the impersect and unsatisfactory compilations of Richter, or the meagre abridgment of some French translator.

The Author of the present Letters is a gentleman of great distinction in the Swedish church. He is equally conspicuous for the lustre of his descent, the extent of his learning, and the excellence of his private character. When Mr. Banks and Dr. Solander were disappointed in their intended scheme of revisiting the South Seas, they determined on a northern voyage, in which they were accompanied by Dr. Von Troil, and other

learned and ingenious gentlemen.

They touched at some of the Hebrides, particularly at I-Colm-Kill, that illustrious seat of learning in the middle ages, and at Staffa—the Island of Pillars—as it might be called. But Iceland was the capital object of this voyage, and to that country Dr. Von Troil hath chiefly confined his observations.

Though the philosophers of Sweden and Denmark had access to many accounts of Iceland, collected at the expence of government, and published by the authority of the court of Copenhagen, yet they anxiously requested the observations of Dr. Von Troil. These Letters are the result of their applications. They were afterwards published, received with avidity, and were soon translated into the German language; from which translation they are now rendered into English. Three of the Letters published in the present work are the production of the Chevalier Ihre of Upsal, Dr. Bach, and Prosessor Bergman of Stockholm: the first on the Edda; the second on the Icelandic scurvy and elephantiass: and the third on the effects of fire at the volcanos and hot springs; together with observations on the basaltes and such columns as are found at Staffa and elsewhere. This last is a most curious production, but abounds too much

in technical terms to be generally entertaining. The modely of the learned Professor is not less singular than his ingenuity, and we earnessly recommend his cautious method of philosophising as a rule to all suture adventurers in the world of nature.

The Letters of Dr. Von Troil are in number twenty-two. Their general contents are as follows. On the effects of fire in Iceland-Of Iceland in general-Of the constitution of the country-Of the arrival of the Norwegians, the government and laws in Iceland-Of its ecclesiastical affairs-Of the character and manner of life of the Icelanders-Of their dress-Their houses and buildings—Their food—Their employment, with remarks on their chronology—Of the diseases of Iceland— Of fishing, fowling, and the breed of cattle in Iceland-Of its trade-Of Icelandic literature-Of printing in Iceland-Of the remains of antiquity still visible in this island-Of Icelandic poetry-Of the volcanos in Iceland-Of Mount Heckla-Of the hot spouting springs in Iceland-Of the pillars of basalt in the islands of Staffa and Bo-sha-la among the Hebrides; to which is subjoined, Mr. Banks's curious account of Staffa, &c. in a letter to Mr. Pennant.

Where we receive valuable information, we should not be forward to criticise; and the little that may appear for the exercise of this ungrateful employment in the present work will be overlooked amidst the numerous appearances of candour, ingenuity, and good sense.

We shall extract a very considerable part of the first letter as an entertaining and instructive specimen: and we fix on this letter more particularly, because it gives a general account of

what is afterwards more diffusely related.

Gon our arrival in Iceland, on the 28th of August 1772, we directly saw a prospect before us, which though not pleasing, was uncommon and surprising. Whatever presented itself to our view, bore the marks of devastation: and our eyes, accustomed to behold the pleasing coasts of England, now saw nothing but the vestiges of the operation of a fire, Heaven knows how ancient!

The description of a country, where, quite close to the sea, you perceive almost nothing but sharp cliffs, vitrified by time, and where the eye loses itself in high rocky mountains covered with eternal snow, cannot possibly produce such emotions as at first sight might entirely preposses the thinking spectator. It is true, beauty is pleasing both to our eyes and our thoughts: but gigantic nature often makes the most lasting impressions.

We cast anchor not far from Besselden, the dwelling-place of the celebrated Stourlison, where we found two tracts of lava (called in Iccland Hraun), of which particularly the last was

remarkable,

temarkable, fince we found there, besides, a whole sield covered with lava, which must have been liquid in the highest degree, and. whole mountains of turf. Chance had directed us exactly to a spot on which we could, better than on any other part of Iceland, consider the operations of a fire which had laid waste a Aretch of fixty or seventy English miles. We spent several days here in examining every thing with so much the more pleasure, fince we found ourselves, as it were, in a new world.

We had now feen almost all the effects of a volcano, except the crater, from which the fire had proceeded. In order, therefore, to examine this likewife, we undertook a journey of twelve days to Mount Heckla itself. We travelled between three and four hundred English miles over an uninterrupted tract of lava, and had at last the pleasure of being the first who ever reached the summit of this celebrated volcano. The cause that no one has been there before is partly founded in superstition, and partly in the extreme difficulty of the ascent before the last discharge of fire. There was not one in our company who did not wish to have his clothes a little finged, only for the fake of feeing Heckla in a blaze: and we almost flattered ourfelves with this hope, fince the Bishop of Skalholt had informed us, in the night between the 5th and 6th of September, the day before our arrival, flames had proceeded from it; but now the mountain was more quiet than we wished. We however passed our time very agreeably, from one o'clock in the night till two next day, in visiting the mountain. We were even so happy, that the clouds, which covered the greatest part of it, dispersed towards evening, and presented us the most extensive prospect Imaginable.

The mountain is something above five thousand feet high, and separates at top into three points, of which that in the middle is the highest. The most inconsiderable point of the mountain consists of lava; the rest are ashes, with hard, solid stones thrown from the craters, together with some pumice stones, of which we found only a small piece with a little native sulphur.

Amongst many other openings, four were peculiarly remarkable; the first, the lava of which had taken the form of chimney-stacks half broken down; another, from which water had streamed; a third, all the stones of which were red as brick; and lastly, one from which the lava had burst forth in a Aream, which was divided at some distance into three arms. I have faid before, that we were not so bappy as to see Heckla throw up fire; but there were sufficient traces of its hurning inwardly; for on the upper half of it covered over with snow of, the depth of four or five inches, we frequently observed spots without any snow; and on the highest points where Fahrenheit's thermometer was at 24° in the air, it rose to 153° when it was Ray. Sept. 1780. . Rav. Sept. 1780.

that we could no longer observe the heat with a small pocket thermometer.

It is not known, whether fince the year 1693 Heckla hath been burning, till 1766, when it began to throw up flames on the 1st of April, and was burning for a long time, and destroyed the country for many miles round. Last December some flames likewise proceeded from it; and the people in the neighbourhood believe it will begin again to burn very soon, as they pretend to have observed, that the rivers thereabout are drying up. It is believed that this proceeds from the mountain's attracting the water, and is considered as a certain sign of an impending eruption. Besides this, the mountains of Myvatn and Kaltlegia are known in this country, on account of the violent inflammations of the former between the years 1730 and 1740, and the latter 1756.

But permit me, Sir, to omit a farther account of the volcano at this time, in order to speak of another effect of the fire, which is much finer, and as wonderful as the first; and so must be the more remarkable, as there is not in any part of the known world any thing which resembles it; I mean the box

fprings of water which abound in Iceland.

'They have different degrees of warmth, and are on that account divided by the inhabitants themselves into Langar, warm baths, and Heuren, or jets d'eaux: the first are found in several parts of Europe, though I do not believe they are employed for the same purposes in any other place; that is to say, the inhabitants do not bathe in them here merely for their health, but they are likewise the occasion for a scene of gallantry. Poverty prevents the lover of Iceland from making presents to his sair one; and nature presents no slowers of which elsewhere garlands are made; it is therefore customary, that, instead of all this, the swain perfectly cleanses one of these baths, which is afterwards honoured with the visits of his bride.

The other kind of springs mentioned above deserve more attention. I have seen a great number of them; but will only say something of three of the most remarkable. Near Laugervatn, a small lake of about a mile in circumserence, which is about two days journey distant from Heckla, I saw the first hot jet d'eau; and I must confess, that it was one of the most beautiful sights I ever belield. The morning was uncommonly clear, and the sun had already begun to gild the tops of the meighbouring mountains; it was so persect a calm, that the lake, on which some swans were swimming, was as smooth as a

The sebject is resumed by Dr. Von Troil, and more largely discussed in the 18th, 19th, and 20th letters, booking-

looking-glass; and round about it arose in eight different places the steam of the hot springs, which lost itself high in the air.

Water was spouting from all these springs; but one in particular continually threw up a column from eighteen to twenty-four seet high; and from sax to eight seet diameter. The water was extremely hot. A piece of mutton and some salmon-trouts were boiled in it; and likewise a Ptarmigan, which was almost boiled to pieces in six minutes, and tasted excellently.

I wish it was in my power to give such a description of this place as it deserves; but I fear mine will always remain inferior in point of expression. This much is certain at least, Nature never drew from any one a more cheerful homage to our great

Creator than I here paid him.

At Reikum was another spout of the same sort, the water of which I was assured rose to sixty or seventy seet perpendicular height some years ago; but a sall of earth having almost covered the whole opening, it now only spouted between fifty-sour and sixty seet, sideways. We sound a great many petrified leaves in this place, as likewise some native sulphur, of which too the water had a much stronger taste than any where else.

I have referved the most remarkable water-spout for the end, the description of which will appear as incredible to you as it did to me, could I not affure you, that it is all perfectly true, as I would not aver any thing but what I have seen

myfelf.

At Geyser, not far from Skalholt, one of the episcopal sees in Iceland, a most extraordinary large jet-d'eau is to be seen, with which the celebrated water-works at Marly and St. Cloud, at Gassel and Herrenhausen, are hardly to be compared. One sees here, within the circumference of about three miles, forty or fifty boiling springs together, which, I believe, all proceed from one and the same reservoir. In some the water is persectly clear, in others thick and clayey. In some, where it passes through a fine ochre, it is tinged as red as scarlet; and in others, where it flows over a paler clay, it is as white as milk.

The water spouts up from all: from some continually, from others only at intervals. The largest spring, which is in the middle, engaged our attention particularly the whole day, which we spent here from six in the morning till seven at night. The aperture through which the water arose (the depth of which I cannot determine) was nineteen feet in diameter: round the top of it is a bason, which, together with the pipe, has the form of a cauldron. The margin of the bason is upwards of nine feet one inch higher than the conduit, and its diameter is of sifty-six seet. Here the water doth not spout continually,

but only at intervals, several times in the day; and, as I was informed by the people in the neighbourhood, in bad, rainy

weather, higher than at other times.

- On the day that we were there the water spouted at ten different times, from fix in the morning till eleven in the foremoon, each time to the height of between five and ten fathoms.—The people who were with us told us, that the water would soon spout up much higher than it had till then done, and this appeared very credible to us. To determine its height therefore with the utmost accuracy, Dr. Lind, who had accompanied up on this voyage in the capacity of an astronomer, set up his quadrant.
- Soon after four o'clock, we observed the earth began to tremble in three different places, as likewise the top of a mountain which was about 300 fathoms distant from the mouth of the fpring. We also frequently heard a subterraneous noise, like the discharge of cannon, and immediately a column of water spouted from the opening, which at a great height divided itself into feveral rays, and, according to the observations made by the quadrant, was ninety-two feet high. Our great furprife at this uncommon force of the air and fire was yet increased, when many stones, which we had thrown into the aperture, were thrown up with the spouting water. You can hardly conceive, Sir, with what pleasure we spent the day here. Nor am I much surprised, that a people so much inclined to superstition as the Icelanders are, imagine this to be the entrance of hell; for this reason, they seldom pass one of these openings without spitting into it; or, as they say, uti fandens mun, into the devil's mouth.'

Of Mount Heckla and Geyser Dr. Von Troil gives a more

particular account in fome, fucceeding letters.

The Icelandic chronicles inform us of no irruptions from any volcanos in that country before the arrival of the Norwegians in the 9th century. Since that period, they have been recorded with confiderable accuracy. These chronicles give a list of sixty-three eruptions at Heckla and other places from the year 1000 to 1766, of which twenty-three were eruptions of Mount Heckla only.

Dr. Von Troil observes, that, 'in the year 1728, many farms were destroyed near Krasse, and a large lake called Myvatn was entirely dried up, into which the streams of fire that rolled from the mountain flowed during some years, and formed a tract of lava of sour miles in length and one and a half in breadth. In 1755, Kattlegian laid waste six parishes, and in the same year, the last cruption of Heckla ravaged a tract many miles to the

North-east.

In another letter to Professor Bergman, on the subject of volcanos, our Author remarks, that the first thing that is usually observed before a new eruption of fire, is the bursting of the mass of ice on the mountain with a dreadful noise. Flames then, with lightning, and balls of fire, issue with the smoke, which are seen several miles off. With the slames proceed a number of larger and smaller stones which are sometimes thrown to an incredible distance. I have seen a round stone about a mile from Heckla which was an ell in diameter, and had been thrown there in the last eruption of Heckla. Egbert Olassen also relates, that at the last eruption of Kattlegiaa, a stone, which weighed 290 pounds, was thrown to the distance of sour miles.

The 14th letter, on Icelandic literature, is particularly curious and instructive, Are Frode and Snorre Sturlesan, the writers of the Edda, are produced by our Author as tellimonies to the learning of Iceland in the twelfth and thirteenth centuries. They were both natives of the country, and were educated there. 'It may be affirmed (says Dr. Von Troil), that Iceland, from the introduction of the Christian religion in 1000, till the year 1264, when it became subject to Norway, was one of the few countries of Europe, and the only one in the North, where the sciences were cultivated and held in esteem. This period of time hath also produced more learned men than any other period fince. We need only read their ancient chronicles to be convinced, that they had great knowledge in morality, philosophy, natural history, and astronomy. They had tolerably clear ideas of divinity, and used to read the Fathers: but their poetical and historical productions in particular have bid defiance to time, even when ignorance was again beginning to refume her empire.'

Dr. Finneus, the learned Bishop of Skalholt, in his Ecclesiaftical History of Iceland, published in 1772, compares the state of the sciences in Iceland to the sour stages of human life, Their infancy extended to the year 1056, when the introduction of the Christian religion produced the first dawn of light. They were in their youth till 1110, when schools were first established, and the education and instruction of youth began to be more attended to than before. The manly age lasted till about the middle of the 14th century, when Iceland produced the greatest number of learned men. Old age appeared towards the end of the same century, when the sciences gradually decreated, and were almost entirely extinct, no works of any merit appearing. History now drooped her head, poetry had no relish, and all other sciences were enveloped in darkness. schools began to decay, and in many places they had none at all, It was very uncommon for any one to understand Latin,

X

and few priests could read their Breviary and Rituals suently.—We cannot wonder at this in Iceland, when the history of the church affords so many examples of Bishops who were present at Councils, at the conclusion of which they caused to be written under the acts the following testimony of their ignorance, "Quoniam dominus episcopus scribere nescit, ideo ejus loco subscrips N. N." i. e. Because my Lord the Bishop is unable to write, therefore N. N. subscribes his name for him.

Dr. Von Troil pays a compliment to some learned and inge-

Dr. Von Troil pays a compliment to some learned and ingenious gentlemen, natives of Iceland, who either reside in the country, or are travelling abroad in the laudable pursuit of knowledge. He places the present Bishop of Skalholt in the first class of Icelandic literati, and speaks of his Ecclesiastical History as 'replete with information, criticism, and erudition.'

Our opinion of the merit of these letters may be collected from what we have before said. As to the translation (which is prebably the work of a foreigner), it is on the whole well performed: and though the construction in some places is perplexed and inelegant, yet it is in general correct, and sufficiently intelligible.

ART. VIII. An Account kept during thirteen Months in the Royal Obserquatory at Greenwich, of the going of a Pocket Chronometer; made on a new Construction, by John Arnold, having his new invented Balance Spring, and a Compensation for the Effects of Heat and Cold in the Balance. Published by Permission of the Board of Longiaude. 4to. 1s. 1780. Sold by John Arnold, No. 2, Adamsireet, Adelphi; also by T. Becket, Strand.

REVIOUS to the account of the going of this excellent machine, which we shall extract from the present pamphlet it may not be impertinent to give our Readers a short detail of what had been done by others, in the same way, before the matter was taken up by Mr. Arnold.

Gemma Frisus seems to have been the first who suggested the method of finding the longitude at sea by means of watches, or time-keepers; which machines were then, as he says, but lately invented. After him Medius, and some others, attempted it; but the state of watch-making, as will easily be imagined, was then too impersect for this purpose. The dispute between Hooke and Huygens, concerning the invention and application of the pendulum spring to watches, was long and violent: each of them claiming this curious and most useful invention, and representing the other as a pirate. We sincerely believe that their claims were each of them just, and consequently their accusations of each other equally unjust: nor is this the only instance in which different persons have made the same discovery, nearly about the same time. The geometrical construction of solar eclipses by Flamsted, Halley, and Sir Christopher Wren;

+ Sualso, our ausmet of the original, Appendix to Res. vol. LIX. p. 506.

and the invention of instruments for taking angles at sea by reflection, by the late illustrious Sir Isaac Newton and Mr. Hadley, are now well known, and acknowledged to have been discovered by the several persons, intirely independent of each other. Moreover Hooke and Huggens, each of them, on making this discovery, applied it to the purpose of discovering the longitude Some disputes, however, between the sormer of those gentlemen and the English ministry, at that time, prevented the making any experiments with watches constructed by him; but many experiments were made with watches constructed by Mr. Huygens, from which it appeared that those watches were of no real use at sea, for this purpose. Dr. Hooke never, as far as we know, made a full discovery of his inventions of this kind; but many hints are dropped, in different parts of the Philosophical Transactions, his Philosophical Collections, and Cutlerian Lectures, of which later mechanics have undoubtedly availed themselves.

In 1714, an act passed for giving 20,000 l. to that person who should first discover a method, by which a ship might sail from England to any port in the West Indies, without baving committed an error of 30' in her longitude, on arriving at the said port. The first who turned his thoughts this way, in consequence of this public encouragement, was Henry Sully, as Englishman, but who had left England before the passing of this act: for in 1714 he printed, at Vienna, a small tract on the subject of watch-making; and soon after he removed from thence, and fettled at Paris, where he spent the remainder of his life in improving time-keepers for the discovery of the longitude. In 1716 he presented a watch, of his own making, to the Royal Academy of Sciences, which was much approved. It is particularly faid, that he had greatly diminished the friction; and that what he had not taken entirely away, he had, by a very fingular address, rendered uniform. He went to Bourdeaux In 1726 for the convenience of trying his watches, and died there in 1728. The greater part of what is yet known of watchmaking in France is principally to be attributed to him; for the famous Julien le Roy was his pupil, and owed most of his inventions to him, which he afterwards perfected and executed; and this gentleman, his fon, and M. Berthoud, are the only persons in France who have turned their thoughts this way fince the time of Sully. Several watches, made by the two latter artiffs, have been tried at fea, at the expence of the King of France, and very voluminous accounts of these trials have been published with great pomp; but the facts which are these related are so very few, and those sew enveloped in such a volume of words, vague and indeterminate in their meaning, that it is 0 4 scarce N scarcely possible to discover, from thence, what these watches are capable of performing \*.

M. Berthoud, in a pretty bulky pamphlet in 4to, entitled Eclair cissemens sur l'invention, &c. des nouvelles machines proposées en France pour la determination des longitudes en Mer par la mesure du temps, has with great labour collected together a sew of the principal sacts which resulted from the three last trials that were made of two time-keepers constructed by M. Le Roy, marked A and S; and of two of his own construction, denominated No. 6 and No 8, which are as follow:

June 8th, 1768, being then at Haure de Grace, M. Le Roy's time-keeper A lost  $1^m \frac{1}{2}$  a day on mean time; and S gained  $4^m$  a day. At the island Miquelon, on the coasts of Newfoundland, A was losing at the rate of  $0^m \frac{2}{3}$  a day, and S gaining about  $10^m$  a day on mean time. At Cadiz S gained on different days between the 16th and 30th of September  $1^m \frac{1}{2}$ ,  $1^m \frac{3}{4}$ ,  $3^m$ ,  $2^m \frac{1}{3}$ ,  $2^m \frac{3}{4}$  and  $6^m \frac{1}{2}$  a day on mean time; and A gained on the same days, respectively,  $2^m$ ,  $2^m \frac{3}{4}$ ,  $2^m \frac{3}{4}$ ,  $2^m \frac{3}{4}$ ,  $2^m \frac{3}{4}$ , and  $14^m \frac{3}{2}$  a day. A gained on mean time, at Brest, from the 4th of November to the 7th, at the rate of  $7^m \frac{3}{3}$  in 24 hours, and 8 at the rate of  $5^m \frac{1}{6}$ .

In November 1768, the time-keepers, No. 6 and No. 8, made by M. Berthoud, were put to the trial in a voyage conducted by Mt Fleurieu.

Voyaga fait par Ordre du Boi en 1771 et 1772 pour verifier PUtilité de pluseurs Methodes et Infruments, servant à determiner la Latitude et La Longitude. Par Mess. Perdun de la Grenne, Le Chevalier de Borda, et Pingre, 400. 11. Tom. 1778.

Roy, marked A and S, and M. Berthoud's No. 8, were again fent out on trial under Mess. Verdun, Borda, and Pingre, A was the same watch which had been tried before by the Marquis de Courtanvaux, and M. Cassini; but that marked S was a new one. They had also with them a small watch made by M. Le Roy, which, on account of its size and form, they called La petite ronde: but this did not answer at all. The performances of the other three were as follow:

No. 8. | Watch A. | Watch S. At Brest, Oct. 10th to 26th, 1771, Gain. 1"39 Lost 2"14 Gain. 1"48 Cadiz, Nov. 21st to Decem 1st, Do. 0 50 Do. 1 oc Do. On the 17th of March the ship struck on the Wilmington Rock, which lies off the island of Antigua; and the thermometer of compensation for heat and cold of the watch A was broken by the shock, and the watch put entirely out of order. This accident was the cause of their putting back to Port Royal.

Were we to form our judgement from this account, it would appear, that M. Berthoud's time-keepers greatly exceed those of M. Le Roy: but it ought, perhaps, to be observed, that this (No. 8.) is the only one of his making which has performed so well; and even this, on the former trial, did not go with any

very great degree of regularity.

About the year 1720, Mr. John Harrison, whose name is now so well known on account of his time-keepers, began to apply himself to the construction of them: and in the year 1730, one of them was tried, on board his Majesty's ships, in a voyage to and from Lisbon; in which trial it gave so much satisfaction, that he received public encouragement to proceed, and began to entertain hopes of obtaining the reward offered by the act of the 12th of Queen Anne; in order to which, he made three other time-keepers, every one of which was more accurate, and better adapted to the purpose of measuring time truly at sea, than the former. The second of these was finished in 1730; and during the next ten years its going was so much admired, by the ingenious men of those times, that the annual prize medal, distributed

buted by the Royal Society; for improvements in experimental philosophy, was given to Mr. Harrison on St. Andrew's day, 1749. Mr. Harrison did not finish his third machine until the year 1758; having then a fourth in confiderable forwardness, and which he finished in October 1761: this proved so much to his fatisfaction, that he wrote immediately to the commisfioners of the board of longitude, informing them that he was then ready to make the ultimate trial prescribed by the abovementioned act. Accordingly Mr. William Harrison, son of the inventor, embarked on board his Majesty's ship Deptsford, in November 1761, with this fourth time-keeper, on a voyage for Jamaica; and the longitude of the island, as shewn by the timekeeper, on his arrival there, differed but one minute and a quarter of the equator from the true longitude deduced from Astronomical Observations. The time-keeper also pointed out the longitudes of the several places, which they saw in the course of the voyage, in a very exact manner. Mr. Harrison junior returned to England, with the time-keeper, in the latter end of March 1762, and found that it had erred in the whole, from its fetting out to its return to England, no more than 1' 54"1 in time, or 285 minutes of longitude.

Mr. Harrison now claimed the whole reward of 20,000 l. offered by the act of the 12th of Queen Anne (1714); but some doubts arising in the minds of the Commissioners concerning the true situation of the island of Jamaica, the manner in which the time at that place had been found, as well as at Portimouth; and it being further fuggested by some, that although the timekeeper happened to be right at these two times, namely when at Jamaica, and on its return to England, it was by no means a proof that it had been always so in the intermediate times, another trial was proposed in a voyage to the island of Barbadoes, in which precautions were taken to obviate as many of those objections as possible. Accordingly, the Commissioners having previously sent out proper persons to make astronomical observations at that island, which, when compared with other corresponding ones made in England, would determine, beyond a doubt, its true fituation; Mr. William Harrison again fet out, with his father's time-keeper, in the latter end of the month of March 1764, the watch having been compared with equal altitudes before he fet out, at Portsmouth; and arrived at Barbadoes about the middle of May: where, on comparing it again with equal altitudes of the fun, it was found to thew the difference of longitude between Portsmouth and Barbadoes 3h 55' 3": the true difference of longitude between these places, refulting from aftronomical observations, is 3h 54' 20": consequently the error of the watch was 43", or 10' 45" of longitude. The watch gained at the rate of 2", 58 a day on mean time, from from February 29th, to March 21st, at Portsmouth; and lost at the rate of 2", 8 a-day, from May 14th to May 17th, at Barbadoes.

In consequence of this and the former trials. Mr. Harrifon received a moiety of the reward offered by the act of the 12th of Queen Anne, on his explaining the principles by which his time-keeper was confiructed, and delivering it, as well as the former three, up to the Commissioners of the longitude, for the use of the Public. He was also promised the other moiety of the reward, when other time-keepers were made, on the same principles, either by himself or others, which performed equally well with that which he had last made. This last time-keeper was also sent down to the Royal Observatory at Greenwich, to be tried there, under the direction of the Rev. Mr. Maskelyne, his Majesty's Astronomer Royal. It did not appear, however, that during the time of this trial \*, the watch went with the regularity that was expected; nor, indeed, with any thing near the regularity that it must actually have gone with during the course of the two voyages that had been made with it; which surprised many, and conveyed no favourable impression of the general utility of this method of discovering the longitude at sea; as it gave reasons for apprehending that the performance, even of the same watch, was not at all times equal; and consequently that little certainty could be expected in the performance of different ones. Moreover, the watch was now found to go faster than it did during its voyage to and from Barbadoes, by about 18 or 19 feconds in twenty-four hours: but this circumstance was accounted for by Mr. Harrison, in a publication entitled, Remarks on a Pampblet lately published by the Rev. Mr. Maskelyne; where he tells us, that not expecting the watch would be required of him so soon as it was, he had altered the rate of its going, by trying some experiments which he had not time to finish before he was ordered to deliver the watch up to the board. Is it not possible that the watch might be disordered by these experiments, and that disorder be the cause of its subsequent irregularity?

Soon after this trial, the Commissioners of Longitude agreed with Mr. Kendall, one of the watchmakers appointed by them to receive Mr. Harrison's discoveries, to make another watch on the very same construction with this, in order to determine whether other watchmakers could make them from the account which Mr. Harrison had given, as well as himself. The event proved the affirmative: for the watch produced by Mr. Ken-

<sup>\*</sup> See an account of the going of Mr. John Harrison's watch at the Royal Observatory, by the Rev. Nevil Maskelyne, Astronomet Royal. Published by order of the Commissioners of Longitude.

dall, in consequence of this agreement; went considerably better than that which had been made by Mr. Harrison himself: and indeed better than any which have been made fince on other principles, this only excepted which is the subject of the account before us.

This watch, made by Mr. Kendall on Mr. Harrison's construction, was fent out in the second voyage which Captain Cook made towards the South Pole, and round the world, in the years 1772, 1773, 1774 and 1775, to be tried under the care of Mr. Wales, who was employed by the Board of Longitude for that purpose: and it appears, from his account, that this watch was losing at the rate of \( \frac{1}{2} \) of a second a day, from March the 24th, to April 25th, 1772, at the Royal Observatory at Greenwich. August 1st, 1772, at the island of Madeira, latitude 320 N. longitude 170 W. it lost at the rate of 1", 77 a-day on mean time. At the Cape of Good Hope, latitude 33° 1 S. longitude 18 1 E. it gained at the rate of 1", 2 a-day on mean time, from November 2d, to the 14th, 1772; and the greatest variation between the rates of its going, on any two days was 5", 4. At Dusky Bay, in New Zealand, latitude 45% S. longitude 166° E. the watch gained at the rate of 6", 7 a-day, from the 6th of April to the 25th, 1773, and its greatest variation was 3", 6 from any one day to any other in that time. The watch gave the longitude of the island of Madeira 17° 6'; W. which, for aught that is yet known to the contrary, is the exact longitude of that place. It made the longitude of the Cape of Good-Hope 180 12' E. which is about 11' short of the truth; and the longitude of Dusky Bay, in New Zealand, 163° 47' E. or too little by about 2 15'1. But we ought, perhaps, with the person who had this watch then under his care, to observe, that in the compass of these 13 months, the watch had passed through all climates, from the latitude of 51 1 N. to 67° S, and over a space nearly equal to the whole equatorial circumference of the earth. The only defect which appears to have been in this watch is, that its rate of going was continually accelerated; but in the three years and an half, that it was under this trial, it never amounted to 14" a-day; for on its return to Greenwich, in the month of August 1775, it gained only 13" a-day; and its greatest rate during the voyage was at Fyal, one of the western islands, where it gained at the rate of 13", 5 a-day on mean time.

In consequence of the going of this watch, the House of Commons were pleased, in 1774, to order the other moiety of the reward, offered by the act of the 12th of Queen Anne, to be given to Mr. Harrison: and to enact, that any other person, who, by means of a time-keeper, the principles of which had not then been made public, should enable a ship to keep her longitude,

longitude, during a voyage of six months, within 60 geographical miles, or a degree of a great circle, should be entitled to a reward of 5000 l.; that in case he could enable her to keep her. longitude for the same time, within 40 geographical miles, or two-thirds of a degree of a great circle, he should be entitled to a reward of 75col.; or to a reward of 10,000l. if he enabled her to keep it, for that time, within 30 geographical miles, or half a degree of a great circle. It is scarcely posfible to reflect on the circumstance, without smiling at the oddness of it, that in all the acts of the British legislature, concerning the longitude, a standard, or measure, should be made choice of, for determining the reward, which, strictly speaking, has no relation to the subject. Sixty geographical miles, or one degree of a great circle, may make either one, or one hundred and eighty degrees of longitude! The determination ought clearly to have been in minutes of the equator: as it now is, it may be subject to numberless disputes. Accordingly, we find Mr. Arnold, in the introduction to the account before us, hinting, that although the greatest error of his watch be 38 minutes at the equator, which is more than is allowed by the act, yet, that it amounts to no more than about 25 geographical miles at the entrance of the channel of England.

It appears from this report of the going of Mr. Arnold's watch, that the mean rate which it went at, during the month of February 1779, was losing o", 31 a-day on mean solar time; during the month of March, its mean daily loss was 1", 37; during the month of April, 1", 38; during the month of May, 1", 34; the month of June, 1", 47; July o", 31; August o", 55. In the month of September it gained, on mean solar time, at the rate of o", 44 a-day; in October, at the rate of o", 38; at the rate of o", o4 in the month of November; and it lost at the rates o", 50, o", 68, and o", 60, respectively, in the months of December 1779, January and February 1780. From hence it appears, that the parts of this machine, which are to counteract the effects of heat and cold, are most exactly adjusted; and perform their office with all

the regularity that can ever be expected.

It further appears, that Mr. Arnold has very happily adjusted his balance, to go alike in the different positions that the watch may be put into: for we find, that when the watch was in an horizontal position, with the face upwards, it gained at the rate of 1", 72 a-day, on mean solar time; with the face downwards, it gained 2", 83: in a vertical position, with the hour XII. upwards, it gained at the rate of 0", 35 a-day; with the hour VI. highest, at the rate of 3", 85 a-day; with the hour IX. highest, it lost at the rate of 0", 29 a-day; and with the hour III. highest, it lost at the rate of 0", 35 per day. Artists, who know from experience

perience the great difficulty of adjusting the balance of a watch In this respect, will allow, that notwithstanding the most happy combination of accidents that could possibly have concurred, the Iabour and judgment that must have been employed, to produce this agreement, in all the possible positions that the watch can be placed in, deserves admiration; and as so nice an agreement, in this respect, has, perhaps, never happened in any watch before, so it will no way reflect on the ingenious constructor's judgment and skill, should he never, himself, be able to produce the like agreement again. --- Neither is so great a nicety, in this respect, absolutely necessary for the purpose of discovering the longitude at fea, as there never can be occasion to put the watches into all these positions ——The greatest difference between the rates at which the watch went on any two days, in these 13 months, is 6", 69; namely, between its rates on October 8th, and December 26th. The greatest difference between its rates of going on any day, and the next to it, is 4", 11; namely, between the 26th and 27th of December. So that the greatest error that it would have committed in the difference of longitude, on any one day, would have been very little more than one minute; which, as Mr. Arnold justly observes, is determining the longitude daily, to as great precision as the latitude can, in general, be determined.

If we take the mean rate which it went at during the month of February 1779, as a standard rate with which we may compare its going for the following twelve months, we shall find that the greatest error which it would have committed in the longitude, shewn by it, would have been 2', 33", 2, or 38' 18" in longitude: and this error happened about the end of fix months, or in the beginning of September; for, during these fix months, the watch had all along gone flower than it did in the month of February, with which rate of going it is compared; but, about the beginning of September, it began to go rather faster than it did in the month of February, and, by that means, began to lessen its total error. And it continued to do fo until the latter end of November, when it began again to go flower than it had done in the month of February, and, of course, to increase the quantity of its total error. And this it continued to do until the latter end of February 1780, when the error appeared again to be at a maximum, and equal to 2' 6", 6 in time, or 31' 39" of longitude. After this time it rather decreased to the end of the month.

So far as this watch has been tried, it must be acknowledged by all, that it is superior to every one that had been made before it. Nothing therefore seems to remain but for this watch to go equally well at sea, and for Mr. Arnold, or, which would still be better, for some other artists, under his direction,

01

to make other watches, on the same principles, that perform equally well with this, to entitle him to the second reward offered by Parliament for improvements in this branch of mechanics, and also to the universal approbation and applause of his fellow-citizens.

ART. IX. Davies's Life of Garrick. CONTINUED. See our last Month's Review.

Character, as A MAN, we now proceed to extract, from the entertaining work before us, a few particulars relative to his merit, as AN ACTOR:—observing, by the way, once for all, that as in the first respect,—(that of the pleasing companion, the affectionate husband, and the generous friend) sew men have excelled him,—so, in the latter (his prosessional walk), none, that we have heard of, ever equalled him.

Mr. Garrick was born at Hereford, in 1716. His father was a Captain in the army, and generally resided at Lichfield; from which circumstance, it has commonly been supposed that our celebrated David was a native of the last mentioned city.

At about ten years old, young Garrick was placed under the care of Mr. Hunter, master of the Grammar-school at Lichfield. It appears, that even at this early age he had conceived a passion for theatrical representations. When but little more than eleven, he formed the project of getting a play acted by young gentlemen and ladies. Having made trial of his own and his companion's abilities, and prevailed on the parents to give their consent, he pitched on the Recruiting Officer for the play; and assembled his little company in a large room: where his comedy was acted in a manner so far above the expectations of the audience, that it was much applauded. The part of Serjeant Kite, a character of busy intrigue, and bold humour, was performed by little Davy, with that ease and vivacity which (as our Biographer observes) is still remembered with pleasure at Lichfield.

Not long after, he was invited to Lisbon, by an uncle, who was a confiderable wine-merchant in that city; but his stay there was very short, for he returned to Lichfield in the year following. Mr. Davies conjectures, that the gay disposition of the young gentleman was not very suitable to the temper of the old one: which was, perhaps, says he, too grave and auftere to relish the vivacities of his nephew.

On his return to England, our young traveller was sent once more to Mr. Hunter's school, where, Mr. Davies says, it is certain, he did not make a very considerable progress in learning. — His temper was too volatile to apply closely to any par-

ticular study. Several of his father's acquaintance, who knew the delight which he selt in the entertainments of the stage, often treated him with a journey to London, that he might

feast his appetite at the playhouse.

Mr. Samuel Johnson of Lichfield, who hath since made so great a figure in the learned world, was one of David's earliest acquaintance. In the year 1735, as we are here informed, this gentleman undertook the instruction of youth , and Garrick; who was then turned of eighteen, became one of his scholars.—

Notwithstanding the brilliancy of his parts, the classic authors had as yet no charms for Mr. Garrick; his thoughts were constantly employed on the stage; for even at that time he was very busy id composing plays. When his master expected from him some exercise or composition upon a theme, he shewed him several scenes of a new comedy which had engrossed his time; and these, he told him, were the produce of his third attempt in dramatic poetry.

After a trial of fix months, Mr. Johnson grew tired of teaching the classics to three or four scholars; and he and his pupil Garrick

agreed to try their fortunes in the great metropolis.'

As this is an incident in the lives of two very celebrated men; our Biographer authenticates it by the following letters, originally published in the Gentleman's Magazine, a work with which Mr. Johnson hath had much connection. These letters were written by the very worthy Mr. Walmsley, Register of the Ecclesiastical Court in Lichsield, and a friend of Captain Garrick; and were addressed to Mr. Colson, a celebrated mathematician at Rochester.

### " To the Rev. Mr. Colson,

"My dear old friend, Lichfield, 1737.

"Having not been in town fince the year thirty-one, you will the less wonder at feeing a letter from me; but I have the pleasure of hearing of you sometimes in the prints, and am glad to see you are daily throwing in your valuable contributions to the republic of letters.

"But the present occasion of my writing is a savour I have to ask of you. My neighbour Capt. Garrick, who is an honest, valuable man, has a son, who is a very sensible young man, and a good scholar, and whom the Captain hopes, in some two or three years, he shall send to the Temple, and breed to the bar; but at present his pocket will not hold out for sending him to the university. I have proposed your taking him, if you like well of it, and your boarding him, and instructing him in the mathematics, philosophy, and haman learning. He is now nineteen, of sober and good disposition, and is as ingenious and promising a young man as ever I knew in my life. Few instructions on your side will do; and in the intervals of study he will be an agreeable companion for you. His sather will

<sup>•</sup> See more of this in the "Remarks on Johnson's Life of Milton," small edit. p. 47, the note.—For an account of these Remarks, see Review for June, 1780.

be glad to pay you whatever you shall require within his reach. I shall think myself very much obliged into the bargain. GILB. WALMSLEY."

" To the Rev. Mr. COLSON.

" Dear Sir, Lichfield, March 2. "I had the favour of your's, and am extremely obliged to you; but cannot say I had a greater affection for you upon it than I had before, being long fince so much endeared to you, as well by an early friendship, as by your many excellent and valuable qualifications. And had I a fon of my own, it would be my ambition, instead of sending him to the university, to dispose of him as this young gentleman is.

" He and another neighbour of mine, one Mr. S. Johnson, set out this morning for London together. Davy Garrick is to be with you early the next week, and Mr. Johnson, to try his fate with a tragedy, and to see to get himself employed in some translation, either from the Latin or the French. Johnson is a very good scholar and poet, and I have great hopes will turn out a fine tragedy writer. If it should any ways lay in your way, doubt not but you would be ready to recommend and affift your countryman.

G. WALMSLEY." Mr. Davies observes, that Mr. Johnson, in his Biographical and Critical Prefaces to the late edition of the English Poets \*, has, in the life of Edmund Smith, embraced an opportunity of shewing his gratitude to the memory of Mr. Walmsley.—This gratitude, however, we cannot help remarking, appeared in a very questionable shape. After passing the highest encomiums on "Gilbert Walmsley's" character; and even commending and instancing his candour on political points, Mr. Johnson strangely adds, "He was a Whig, with all the virulence and malevo-lence of his party." Could the most bigotted Whig speak with more virulence and malevolence of Samuel Johnson, as a Tory?

Mr. Garrick's further progress, in his out-set on the road of life, is thus related in the second chapter of these Memoirs:

When Mr. Garrick arrived in London, he found that his finances would not enable him to put himself under the care of Mr. Colson till the death of his uncle, who, about the year 1737, left Portugal, with an intention to fettle in London, in which place he soon after fell fick and died. Some time before his death, his nephew David infinuated to him, that he ought to make him some compensation in his will for the disappointment which he had obliged him to incur by a fruitless voyage to Lisbon The old gentleman was convinced that the remonstrance was just, and bequeathed to David a larger portion of his effects than to any of his brother's children; for to him he left one thousand pounds, and to the others five hundred pounds ecah.

"With the interest of the one thousand pounds Mr. Garrick prudently embraced the means of acquiring useful knowledge, by the

<sup>\*</sup> For an account of these Presaces, see our Reviews for July, August, and September, 1779. instruction Rsv. Sept. 1780.

instruction of Mr. Colson. His proficiency, however, in mathematics and philosophy, was not extensive; his mind was theatrically led, and nothing could divert his thoughts from the study of that to which his genius so powerfully prompted him. However, in the company of so rational a philosopher as Mr. Colson, he was imperceptibly and gradually improved in the talent of thinking and reasoning; and the example and precepts of so wise a man were not vainly bestowed on

a mind fo acute and rational as that of the young boarder.

His father, Capt. Garrick, had been many years upon half-pay; but, with a view to the better support of his family, he had embraced an offer to receive the whole emoluments of his post from a brother officer, on condition that he should reside at Gibraltar in his stead. Much about the time when his son David lived with Mr. Colson, the Captain returned to England from that fortress, where he had lived several years. He purposed to sell his commission, from an assectionate and tender motive to procure some permanent substituction for a wife and seven children; but his health was so shattered, and his constitution so entirely broken, that he was not permitted to assemblish his purpose; and he died very soon after.

There was not much more than the intervention of a year be-

tween the death of Mr. Garrick's father and his mother.

Mr. Garrick now found himself free from all restraint, and in a fituation to indulge himself in his darling passion for acting, from which nothing but his tenderness for so dear a relation as a mother

had hitherto restrained him.

However, during the short interval between his mother's death and his commencing comedian, he engaged for some time in the wine trade, and was in partnership with his brother, Mr. Peter Garrick; they hired vaults in Durham Yard for the purpose of carrying on the business. The union between the brothers was of no long date; Peter was calm, sedate, and methodical; David was gay, volatile, impetuous, and, perhaps, not so confined to regularity as his partner could have wished. To prevent the continuance of fruitless and daily altercation, by the interposition of friends, the partnership was dissolved amicably.

And now Mr. Garrick prepared himself in earnest for that employment which he so ardently loved, and in which nature designed

he should so eminently excel.

he got himself introduced to the managers of the theatres, and tried his talent in the recitation of some particular and favourite portions of plays. Now and then he indulged himself in the practice of mimickry, a talent which, however inserior, is never willingly refigned by him who excels in it. Sometimes he wrote criticisms upon the action and elocution of the players, and published them in the prints. These sudden essusions of his mind generally comprehended judicious observations and shrewd remarks, unmixed with that gross illiberality which often disgraces the instructions of modern stage critics, who first knock the actor down, and then graciously tell him his faults.

Mr. Garrick's diffidence with-held him from trying his firength at first upon a London theatre. He thought the hazard was too great, and embraced the advantage of commencing noviciate in act-

Log with a company of players then ready to fet out for Ipswich, under the direction of Mr. William Giffard and Mr. Dunstall, in the

summer of 1741.

The first effort of his theatrical talents was exerted in Aboan, in the play of Oroonoko, a part in which his features could not easily be discerned; under the disguise of a black countenance, he hoped to escape being known, should it be his missortune not to please. Though Aboan is not a first-rate character, yet the scenes of pathetic persuasion and affecting distress, in which that character is involved, will always command the attention of the audience when represented by a judicious actor. Our young player's applause was equal to his most sanguine desires. Under the assumed name of Lyddal, he not only acted a variety of characters in plays, particularly Chamont in the Orphan, Captain Brazen in the Recruiting Officer, and Sir Harry Wildair; but he likewise attempted the active seats of the Harlequin. In every estay he gave such delight to the audience, that they gratified him with constant and loud proofs of their approbation. The town of Ipswich will long boast of having sirst seen and encouraged so great a genius as Mr. Garrick.'

The third and fourth chapters exhibit the characters of the most considerable actors on the British theatre, at the time when D. G. commenced player: for it was a considerable part of our Author's plan, to include, in a narrative of Mr. Garrick's Life, 'many theatrical anecdotes, and a variety of observations on several performers of both sexes, who distinguished themselves by superiority in their profession.' In doing this, he has displayed their merits, and delineated their characters, with judge-

ment and candour.

In Chap. V. he refumes the direct thread of Mr. Garrick's part of the narrative; and entertains us with the following anecdotes; some of which will be new to many of our Readers.

Mr. Garrick had performed a noviciate at Ipswich; and even before his going to that place, he had studied, with great assiduity, a variety of parts in the different walks of acting. The Clown, the Fop, the Fine Gentleman, the Man of Humour, the Sot, the Valet, the Lover, the Hero, nay, the Harlequin, had all been critically explored, and often rehearsed and practised by him in private. After long restection and much serious weighing of consequences, he fixed upon Richard the Third for his first part in London. He had often declared he would never chuse a character which was not suitable to his person; for, said he, if I should come forth in a hero, or any part which is generally acted by a tall sellow, I shall not be offered a larger salary than forty shillings per week. In this he glanced at the folly of those managers who used to measure an actor's merit by his size.

'He could not possibly give a stronger proof of sound judgment, than in fixing his choice on Richard. The play has always been popular, on account of its comprehending such variety of historical and domestic facts, with such affecting scenes of royal misery and distress. Richard was well adapted to his figure; the situations in which he is placed are diversised by a succession of passon, and dig-

mifed by variety and splendor of action. A skilful actor cannot

wish for a fairer field on which to display his abilities.

On the 19th of October, 1741, David Garrick acted Richard the Third, for the first time, at the playhouse in Goodman's-lields. So, many idle persons, under the title of gentlemen acting for their diversion, had exposed their incapacity at that theatre, and had so often disappointed the audiences, that no very large company was brought together to see the new personner. However, several of his own acquaintance, many of them persons of good judgment, were assembled at the usual hour; though we may well believe that the greatest part of the audience were stimulated rather by curiosity to see the event, than invited by any hopes of rational entertainment.

An actor, who, in the first display of his talents, undertakes a principal character, has generally, amongst other distincties, the prejudices of the audience to struggle with, in favour of an established performer. Here, indeed, they were not insurmountable. Cibber, who had been much admired in Richard, had left the stage. Quin was the popular player; but his manner of heaving up his words, and his laboured action, prevented his being a favourite Richard.

"Mr. Garrick's eafy and familiar, yet forcible ftyle is speaking and acting, at first threw the critics into some hesitation concerning the novelty as well as propriety of his manner. They had been long accustomed to an elevation of the voice, with a sudden mechanical depression of its tones, calculated to excite admiration, and to intrapapplance. To the just modulation of the words, and concurring expression of the seatures from the genuine workings of nature, they had been strapgers, at least for some time. But after he had gone through a variety of scenes, in which he gave evident proofs of consummate art, and persect knowledge of character, their doubts were turned into surprise and assonishment; from which they relieved themselves by loud and reiterated applause. They were more especially charmed when the actor, after having thrown aside the hypocrite and politician, assumed the warrior and the hero. When news was brought to Richard, that the Duke of Buckingham was taken, Garrick's look and action, when he pronounced the words,

Off with his head!

So much for Buckingham! were so fignificant and important, from his visible enjoyment of the incident, that several loud shouts of approbation proclaimed the triumph of the actor and satisfaction of the audience. The death of Richard was accompanied with the loudest gratulations of applause.

The same play was acted fix or seven times successively. The receipts of the treasury, which I have before me, amounted, in seven nights, to no more than 216 l. 7 s. 6 d. and this conveys a certain evidence, of what use the kindness, as well as judgment of the manager, is to the growing same of an actor. Gissard to a good understanding joined a sense of honour, with great humanity. He saw Garrick's merit, and did all in his power to support it. Several other parts, among which were Aboan in Oroanoko, Chamont in the Orphan, Clodio in the Fop's Fortune, Bays in the Rehearsal, succeeded Richard; which savourite character was repeatedly called for, and acted to crouded audiences.

Such was the universal approbation which sollowed our young actor, that the more established theatres of Drury-Lane and Covent-Garden were deserted: Mr. Garrick drew after him the inhabitants of the most polite parts of the town. Goodman's Fields was sull of the splendor of St. James's and Grosvenor-Square. The coaches of the nobility filled up the space from Temple Bar to White-Chapel. He had so perfectly convinced the public of his superior accomplishments in acting, that not to admire him would not only have argued an absence of taste, but the grossess superior state, but the grossess superior the old actors, confessed that he had excelled the ablest of them in the variety of his exhibitions, and equalled them all in their most applauded characters.

'Mr. Pope was persuaded by Lord Orrery to see him in the first dawn of his same: that great man, who had often seen and admired Betterton, whose picture he had painted, and which is now in the possession of Lord Manssield, was struck with the propriety and beauty of Mr. Garrick's action; and, as a convincing proof that he had a good opinion of his merit, he told Lord Orrery, that he was afraid the young man would be spoiled, for he would have no competitor.

Mr. Garrick shone forth like a theatrical Newton; he threw new light on elocution and action, he banished ranting, bombast and grimace, and restored nature, ease, simplicity and genuine humour-

'We must not wonder that the comedians were the last who became proselytes to the new philosophy of the theatre: the players, from their limited station, and not from malignity of temper, are more liable to envy and jealousy than persons of most other prosessions. Incroachments and altercations, in a small circle, are as disagreeable as they are unavoidable. The superior merit of one player is often detrimental to the interest of him who thinks himself a competitor. The loss of parts which the actor has played, and, perhaps, with approbation, for a considerable time, is attended with loss of reputation and diminution of income.

"Quin, who had hitherto been esteemed the first actor in tragedy, could not conceal his uneafiness and disgust from the great success of Mr. Garrick. After he had been a spectator of his manner in some important character, which, I believe, was Richard the Third, he declared peremptorily, "That if the young sellow was right, he, and the rast of the players, had been all wrong:" and, upon being told that Goodman's-Fields theatre was growded every night to see the new actor, he said, "That Garrick was a new religion: Whitesield was followed for a time; but they would all come to church again."

'Mr. Garrick, who had a quick and happy talent in turning an epigram, gave this smart reply to Quin's bon mot.

Pope Quin, who damns all churches but his own, Complains that herefy corrupts the town: Schism, he cries, has turn'd the nation's brain; But eyes will open, and to church again!

Thou great infallible, forbear to roar, 'Thy bulls and errors are rever'd no more; When doctrines meet with gen'ral approbation, It is not herefy, but reformation.

Colley

'Colley Cibber, from whom more candour might have been expected, after he had seen Garrick's Bays, which the public esteemed a master-piece of comic humour; said, "Garrick was well enough, but not superior to his son Theophilus, who had little more to re-

commend him in the part than pertness and vivacity."

"Mrs. Bracegirdle, a celebrated actress, who had left the flage for more than thirty years before Garrick's first appearance, and was vifited by many persons of condition and taste, thought very differently of this rising genius. In a conversation which she had with Colley Cibber, who spoke of him with an affected derogation, she reproved his malignity, and generously said, "Come, come, Cibber, tell me, if there is not something like envy in your character of this young gentleman. The actor who pleases every body must be a man of merit." The old man felt the force of this sensible rebuke; he took a pinch of souff, and srankly replied; "Why faith, Bracey, I believe you are right—The young fellow is clever."

Mr. Garrick's weekly income was, at first, very moderate, not exceeding fix or seven pounds. But when it was evident, that the great emoluments from the playhouse treasury were chiefly, if not entirely, owing to his labours, and that the benches of the playhouse were almost always empty when his name was not seen in the playbills, Mr. Giffard very heartily concurred with Mr. Garrick, and his friends, to allow him a full moiety of the profits; and, in this, the manager sound his advantage, for the actor was constantly employed in consequence of his being perpetually admired. To a very long and fatiguing character in the play, he would frequently add another in a farce. The distresses which he raised in the audience by his Less and Richard, he relieved with the roguish tricks of the Lying

Valet, or the diverting humours of the School-boy.'

The great arrear of articles now before us, all preffing for admission into our journal, obliges us to rise, somewhat abruptly, from our present entertainment;—but to which we hope again to sit down, with a good appetite, at a future opportunity. We must not, however, part company without remarking, from our Author's previous advertisement, that he acknowledges himself greatly indebted to his learned friend, Dr. Samuel Johnson, for his encouragement in the prosecution of his design, and particularly for many of the anecdotes relative to the early part of the life of his hero: for which the Doctor was well qualified, having been familiarly acquainted in the family, and with the nearest relations of Mr. Garrick.

· [To be concluded in our next.]

G.

A Complete Body of Heraldry; containing an Historical Inquiry into the Origin of Armories, and the Rise and Progress of Heraldry, confidered as a Science: the Institution of the Offices of Constable, Marshal, and Earl Marshal of England; their concurrent and separate Jurisdictions, Functions, Powers, &c. the Creation and Establishment of Kings, Heralds, Pursuivants, and other Officers of Arms, with their feveral and respective Duties, Badges, Liveries, Wages, Visitations, &c. The proper Method of blaconing and marshalling Armorial Bearings; and therein of Ordinarias, Charges, Marks of Cadency, Additions and Abatements of Honour; Assumptions, Grants, Augmentations, Alienations, Exchanges, &c. The Arms, Quarterings, &c. of all Sovereign Princes and States; as also the Atchievements of the Peers, Peereffes, and Baronets of England, Scotland, and Ireland. An Hiftorical Catalogue of all the different Orders of Knighthood. The Arms of the Counties, Cities, &c. of England, Scotland and Wales, The Arms of Archiepiscopal and Episcopal Sees in England and Ireland. A Discourse on the Origin, Use, and Abuse of Funeral Trophies. GLOVER's Ordinary of Arms, augmented and improved. An Alphabet of Arms, with a copious Glossary explaining technical Terms. Illustrated with Copper-plates. Carefully compiled from the best and most undoubted Authorities by Joseph Edmondfon, Esq; F. S. A. Mowbray Herald Extraordinary; and Author of the Barenagium Genealogicum, and Genealogical Tables of the English Peers. Folio. 2 Vols. 31. 38. unbound. Dodsley, &c. 1780.

HIS title-page feems fufficiently copious, although we have taken the liberty of fometimes inferting the &c. a little fooner than is done in the original. The whole work, indeed, as well as its title, is rather verbose; and, in too many instances, inaccurate.

Among our rude ancestors, when military valour was the only virtue in request, because war was the great business of fociety, gentlemen were principally distinguished by their bravery and conduct in the field. The bravery, indeed, of fuch an age, was little better than fierce brutality, and the perfection of military conduct was nothing more than the artificial stratagem of crafty barbarians. It is probable, therefore, that many families have been ennobled by exploits, which would scarcely, at present, do honour to the meanest of mankind. Yet such exploits being in ancient times thought worthy of general applause and admiration, they formed the main foundation of the distinction of ranks, which afterwards gave birth to the important prerogatives of nobility. But in an improved, commercial age, many new fources are opened to the active ambition of man. The progress of arts, learning, laws, and government, furnish a wide field of emulation; pre-eminence may be attained by the elegant arts of conversation and literature; and it

is expected that a gentleman should be distinguished from a peasant, not merely by his superior courage and more delicate sense of honour, but by the justness and extent of his ideas, and

the propriety of his expression.

In carefully examining the different branches of this very vo-Luminous performance, a Reader may extract a satisfactory account of the rife and progress of gentilitial distinctions, as well as of the present state of that art by which they are ascertained and perpetuated. The Author first examines the much disputed questions, whether armorial enfigns, analogous to our present coats of arms, were known to the ancients. He allows that the Egyptians, Affyrians and Greeks made use of symbolical devices, as public and national standards; and also that their principal leaders represented a variety of figures on their shields and armour. But the former, it is plain, were intended to diftinguish communities, and not, as our coats of armour, families and individuals. The latter, he observes, were not hereditary and permanent marks of gentility, but merely personal and casual ornaments, which were affumed or laid afide according to the whim, fancy, or caprice of the wearer. As to the Romans, it is observed by SILIUS ITALICUS, that the family of the Corvini constantly bore a raven for their crest; and Suetonius, in the life of Caligula, seems to infer, that the Torquati had a chain, and the Cincinnati a tuft of hair, for their family enfigns. The words are, "Vetera familiarum infignia nobilissimo cuique ademit, Torquato torquem, Cincinnato crinem, & Pompeio ftirpis antiquæ magni cognomen." The Author explains this passage: Caligula ordered the chain and tust of hair to be taken from the respective statues of Torquator and Cincinnatus: and he justly remarks, that this meaning is confirmed by the order for erazing the word magnus from the inscription under the statue of Pompey.

The Romans were indeed divided into mebiles, novi, and ignobiles; a distinction taken from the jus imaginum, or the right of having the statues and images of their ancestors. But there is an essential difference between the jus imaginum and the armories of later times. The former was established in favour of those families whose ancestors had executed some important office in the state, and was therefore a civil honour; the latter was established in favour of those only who had signalised themselves in battle, or who held some command in the army.

Having sufficiently resuted the opinion of those writers who maintain the high antiquity of armorial bearings, the Author

explains their real origin.

Upon the whole, the Romans were the first people who thought of distributing the conquered lands amongst the foldiery, to hold by military forvice; that is, on condition of their fighting for, and defending

fending them whenever attacked by the enemy. The northern nations, on their irruption into the Roman empire, from the great opposition which they every where met with on the frontiers, plainty saw the advantages which accrued from the lands being thus granted out in property to those whose interest it was, and who had in themstelves power, to defend them: wherefore, as soon as they had driven out the Romans, and had got possession of their territories, they adopted the same plan; and the conquering general allotted his new acquists to the superior officers under his command, who subdivided them amongst their inferiors, to hold likewise by military service. These military benefices, or, as Sir Henry Spelman very justly styles them, pradia militaria, afterwards were called fenda, or fends to and evidently became the bass of the seudal system.

At first the allotments or military benefices were personal, and granted during the life only of the possessor, after whose decease they reverted to the prince or original grantor: but the seudal system being enlarged and improved, these seuds occasionally and by degrees became hereditary; and accordingly we find that, towards the close of the ninth century, seudatories frequently obtained the Prince's consent, that they might transmit their beneficiary lands to their posterity; and they not long after had the like permission to divide them amongst all their children, charged however with military service in

the defence of the kingdom.

The obligations which each principal feudatory was under of assembling and keeping together his quota of soldiers in time of service, and the necessity there was that the prince or principal commander should be satisfied that his army was joined by all the chief military tenants, with their several powers according to the obligations of their respective tenures, pointed out the utility of each leader's carrying with him some mark or token, whereby not only he himself might be known by his followers, but his place and station in the host might likewise be particularised, and distinguished by those whose duty it was to note down his attendance, to muster the whole body, to regulate its line of march, and to mark out the encampment for each party. In the preceding times, each seader had been habituated to charge his shield and other pieces of armour either

Posthumous Treatise on Feuds.

<sup>†</sup> Mr. Somner supposes that the word Feud is a German compound, which confist of Feb, Feo, or Feob, signifying a Salary, Stipend, or Wages; and of Hode, Bead, or Hode, importing Quality, Kind, or Nature: so that, says he, Feudum, Fee, or land holden in Feo, is no more, considered in its first and primary acceptation, than what was holden in Feo-bode, by contraction Feud, or Feod, i. e. a Stipendiary conditional mercenary way and nature; with the acknowledgement of a superior, and a condition of returning him some service for it, upon the withdrawing whereof the land was revertible unto the lord. This etymon, according to Sir Martin Wright, not only suggests the most probable account of the word, but gives the clearest defection of the thing itself, and is agreeable to the book of Feuds, lib. II. tir. axiii. which says that Beneficium (Feudum) silud est quad ex benevolentia ita dabutur alicui, at proprietas rei penes dantem remaneret, usus structus ad accipientem ejusque barreaes pertineret, ad bor, ut ille Sigus barredes domino sideiner servirent. The sense whereas is thus expertised by Mr. Selden: Feuds or Feuda, being the same which in our laws we call Senancies, or Lands beld, and Feuda also, are possessions so given and held, that the possessions is bound to do service to him from whom they were given.—Wright's Introduction to the Law of Tomures.

with the representation of some animal, a part of some military weapon or engine, or with some symbolical device: and this induced the great landed barons, and others who brought any confiderable number of fighting men into the field, to suspend or exhibit on the top of a lance or pike, elevated so as to be visible at a distance, some en-fign, or piece of silk, or other stuff, whereon was represented a figure similar to that which he himself bore, either on his shield or on his helmet: and those ensigns or military figures, being known to their respective followers, were by them looked for and resorted unto upon every emergency; so that a continuance by each chief, of the use of the same military figure which he had been accustomed to earry, grew in a manner absolutely requisite, lest by any alteration, or the total change of it, his vassals, tenants, and others whose duty it was to adhere thereto, might, especially in time of action, be deceived, thrown into disorder, or drawn into danger. For the like reasons, the sons retained the same military enfigns as their father had affumed; their posterity adopted the example; and at length those ensigns being by general consent considered as solely appertinent to the particular family of him who had originally used them, they became bereditary armories of such family, and were esteemed as the tertain and approved tesser of ancestrial honour and distinction. The reputation thus stampt on armerial bearings introduced such a regard for their prefervation, and so great a propensity to their refinement and improvement, that fundry princes, and more particularly the Emperor Charlemagne, did not feruple to apply themselves with affiduity to the regulation of the use and blazon of armories, which were then confessedly known to be not only the honourable testimo-mies of landed property and dignity, but the acknowledged badges and memorials of personal valour and extraordinary services per-formed in the wars.

•

Thus much in general: in a subsequent passage the Author explains the introduction of family distinctions into England.

From what has been before observed, there is the greatest reason to conclude, that bereditary family arms are of German production and seudal origin; but the time in which they were first used in England is not equally certain. An enquiry into that sact, touching which there has been a greater diversity of opinions than about the origin of the institution itself, is highly interesting, and well worthy of our researches. Our Saxon monarchs have been considered as the introducers of gentilial arms into this island, whilst, on the other hand, some writers have maintained, that arms were used by the Britons at the very time that the Christian saith was first propagated here, and that Lucius, a pro-regulus in Britain in the 48th year of the Christian ara, took for his arms Ar. a cross gules. Canute and his Danes have, in their turns, been honoured with the reputation of having first taught our ancestors the use of arms. The learned and judicious antiquary Mr. Arthur Agarde conjectures that arms came to us first from the Normans, being brought in by Edward the Con-

Sir James Ley, who was afterwards Earl of Marlborough, in his Treatife on the Antiquity of Arms in England.—Antiquary Discourses, vol. i. p. 112. Mr. Tate, ibid. 162.

fessor, and afterwards more plentisusly practised here by William the Conqueror and the nobles who came over with him. Mr. Waterhouse, upon what grounds is uncertain, supposes that gentilial armories were known here before that time; and that the first users of them were those sew of the British and Saxon nobility, who kept their honours, fortunes, and feats on the change of government made by Duke William, and who, not having appeared in opposition to him or his sons, held their stations in the country, although the Normans enjoyed both the places and preferments in court and camp; and as they grew more habituated to his government, and he abated of his rigour, and by peaceable ruling became more calm, they ventured to show themselves more openly, and with greater freedom avowed their rights, by bearing those marks of honourable distinction \*. The great Mr. Camden, who is followed by Peter Pithen and others, thinks them of more recent date with us, and fays, that " shortly after the "Conquest the estimation of arms began in the expeditions to the " Holy Land, and afterwards by little and little became hereditary, " when it was accounted an especial honour to posterity to retain " those arms which had been displayed in the Holy Land in that holy " fervice against the professed enemies of Christianity; and that we " received, at that time, the hereditary use of them; but that the " same was not fully established until the reign of King Henry the "Third; for that, in the instances of the last Earls of Chester, the es two Quincies Earls of Winchester, and the two Lacies Earls of "Lincoln, the arms of the father still varied from those of the son +." Sir Henry Spelman is of opinion, that they are of still more modern growth in this kingdom; for, speaking of the antiquity generally allowed to the usage of arms in England, he observes, that " this nation being for some hundreds of years harassed with wars, in the form of foreign assaults, and civil commotions, there is little es reason to be over confident in matters of pedigree and arms much 44 beyond four hundred years;" and expresses his doubts whether they are even entitled to that antiquity, by adding, " Nescis are « ea prorfus antiquitate "."

"Upon what authority the advocates for the use of gentilial arms being known and practifed in Britain during the Saxon government, ground such affertion, doth not appear, as all the historians of those times are filent as to that matter. The Horse of Hengist and Horsa, -the devices by which the several kingdoms were distinguished from each other during the Heptarchy-the Golden Dragon of Uter, furnamed Pendragon—the three different bearings attributed to his fon Arthur; to wit, first, Two dragons, endersed, or; secondly, Three crowns; and, thirdly, Vert, a cross argent, with the Holy Virgin bolding the infant Jesus in ber arms, on the first quarter 4-the Tunf borne by Edwin King of Northumberland ||-the Banner-roll of gold and purple hung over the tomb of King Oswald at Bardney (')-the

Bede. (\*) Ibid.

Dragon, or, depicted on the banner of Cuthred King of Wessex (†) at the battle of Bureford (‡)—the Saxon blazon, being Azure, a cross formée, or sowery, or (§), and that of the Danes, being Or, semée of bearts, three leopards gules (||)—upon all which stress hath been laid for proving the prevalency of the use of arms in this kingdom in those early times—were no other than the military and imperial ensigns of the several monarchs who bore them, and were never con-

fidered by them in any other light.

Hereditary gentilial arms were the fruits of the feudal law; and, as we have not any good reason to imagine that either such law, or any of the customs to which it gave birth, had gained a footing in England previous to the invasion of William the Norman, we cannot justly expect to meet with any family arms used in this kingdom antecedent to that remarkable event. Notwithstanding this, some writers have suggested that our English King Edward, commonly styled the Confessor, who frequently visited the court of his uncle the Duke of Normandy, and was fond of the fashions and customs there observed, introduced many of them into England; and, among others, that of the use of family arms: in confirmation whereof, they affert that Edward, by way of fetting an example to his subjects for assuming such marks of distinction, took for his own private arms - Az. a cross formée or, between five martlets of the last +, as we find them de-picted in many places in this kingdom. Now, had this really been the case, it cannot reasonably be supposed that a fashion adopted and entroduced by a prince so much beloved by his people as Edward confessedly was, should not be followed at all, or at least by the major part of the principal men in his kingdom, more especially as it was defigned for their honour and diffinction; and confequently that, if the use of family arms had then prevailed among the nobility and gentry of England, some memoranda or traces of such practice must have been handed down to us: whereas nothing of that fort appears. The general histories of those times do not take the least motice of it; and Abbas Rievalensis, Edward's prosessed historian, who is extremely circumstantial even in the minutest occurrences which he thought redounded to his master's character, is totally filent as to this matter; so that no credit can be given to those modern writers, who would perfuade us that the practice of bearing family arms was first brought into England by the Confessor. Further, there is not only great reason to doubt the truth of the affertion, that Edward the Confessor was the person who first assumed the arms above described; but to think that they were the imperial ensigns of his elder brother Edmund Ironside, and actually borne by him at the battle of Aihdon: for Margaret, who married Malcolm Canmore

(1) 1mhoff Blazoniæ Regum Pariumque Magnæ Britanniæ. Spencer'a Opus He-

<sup>(†)</sup> Hoveden. (†) Sax. Chron. (8) Speed, Guillim, York, Gerard, Leigh, Morgan, &c.

They are commonly called Martlets by the heraldic writers; but on the escutcheon of Edward the Consessor's arms, carved on the wall of his abbey-church at Westminster, they are represented with beaks, legs, and claws; whereas the heraldic martlet hath neither beaks nor legs.

<sup>†</sup> Coutumier de Normandie-Ord, Vitalis.

King of Scotland, and was fifter to Edgar Atheling, and daughter of Edward the elder son of King Edmund Ironside, used those very arms after the death of her brother, and fifter Christian, in testimony of her right to the crown of England, as being the only heiress of the Saxon race, and actually had them engraved and fet up on the monafi tery of Dumfermling, of which she was the foundress, where they still remain. The cross formée or, in a field azure, was the Saxon enfign; and therefore there is the greater likelihood, not only that Edward the Confessor, on his ascending the throne, took the imperial enfign of his late brother, rather than that he brought them as newinvented family arms from the Norman court; but also that Margaret of Scotland, in support of her claim to the English crown, would wear the imperial enfigns used by her grandfather, who had been King of England, and not such arms as had been first assumed by her great-uncle Edward the Confessor, who had mounted the English throne, in prejudice to the right of her father, and consequently to that of her brother, and of hersels. The Normans were indeed so well acquainted with the feudal system, that they planned and established the form of their government upon that system, at the time of their first settlement in France; in evidence of which, we find that most part of the lands in Normandy were held of the Duke by military tenure, and that the use of hereditary arms, as well as other feudal customs, were observed by the nobility and chief land-holders of that duchy. Hence there cannot be the least shadow of doubt, that the commanders of those different corps, which composed William's army when he invaded this kingdom, made use of the same marks or tokens of distinction. That such were here used by them, we have a very notable instance. The inhabitants of the senny parts of Cambridge and Lincoln shires resuled to subject themselves to the Norman yoke, and manfully refifted the troops fent by William to force them to obedience; in which opposition they were greatly encouraged and affifted by the monks of Ely; but being at length overpowered by the Normans, the revengeful and imperious monarch had no sooner made himself master of that part of the country, than, in order to keep all things quiet there, and to punish as well as awe the Ely monks, he not only quartered one of his captains upon each of them at bed and board, but required every monk, upon peril of his life, to be answerable for the good maintenance and personal safety of that individual Norman who was so placed under his immediate care and protection. A picture, representing the portrait of each of these Norman chiese, as also that of the monk on whom he was particularly quartered, together with the name and coat of arms of Such Norman, in proper blazon, placed beneath his portrait, was hung up in the refectory of the monastery, and was afterwards removed into the cathedral church at Ely, where it remained till lately. Most of those chiefs obtained lands, and settled in England +, where their descendants continued for many years, and used for their family arms the same figures and devices as are represented in the abovementioned picture, under the portrait of their respective ancestor.

;

Contumier de Normandie.—Ord. Vitalis,

<sup>†</sup> Domesday-Liber Niger Scaccarii.

The fidelity of the picture, so far as regards the coats of arms represented therein, cannot therefore be justly questioned; and if such picture was really genuine, and painted at the time in which the feweral persons whose portraits are therein exhibited were living; it is a proof that hereditary gentilial arms were used by the Normans at the time of their invasion of this kingdom. In short, when the whole of the several arguments that have been offered in support of the different opinions broached, in respect to the time in which armorial bearings were first brought into England, are maturely considered, it will appear manifest that arms, together with the feudal system, from whence they originated, were first introduced into this kingdom by the Normans at the time of the Conquest; and that Duke William having foon after bestowed on his followers those lands and honours, of which he had violently disseised the natives, to hold of him by military or knight's service; those sew of the British nobility and Saxon line, who had been lucky enough to avoid the frowns of the Conqueror, and to keep their honours, fortunes, and estates, assumed to themselves and families certain marks or tokens of distinction simi-Jar to those then used by the new intruders. These British, Saxon, and new Norman Lords, from whom most of our now ancient gentry are descended, being, by the tenure of their lands, obliged, in their persons, and with their dependents, tenants, and servants, to attend their fovereign in his wars, in compliance with the feudal custom, granted out parts of their respective tenures to persons who were allied to them by marriage, or affection, upon such terms as either they themselves held them of the first grantor, or on such other conditions as they thought most expedient for their own private emolument; at the same time assigning to some of them certain coats of armour, which they usually composed of part of their own arms, with fuch differences and additions as they thought proper. Others of these principal tenants, to whom arms had not been thus granted, and who, from the nature of their tenures, were bound not only to give personal attendance on their lord in times of war, but to supply him with a certain number of men completely armed, towards making up the whole complement of foldiers, which he was obliged to bring with him into the field when called on for that purpose by the sovereign, assumed to themselves arms, in great measure resembling those borne by their chief, but yet in some respects varied from them, either in the difference of the charges, or in the diversification of their tindures. The continuance of this practice greatly increased the number of armories, which, as before observed, received a considerable augmentation from the splitting and subdividing of landed property, and were still further multiplied by those used in tilts and tournaments, but most especially by the various arms assumed by that amazing crowd of adventurers who engaged in the Croisades, and, until those times, had never presumed to difference themselves by any peculiar badges or tokens of distinction. After the return of King Richard the First from Palestine, he shewed a particular fondness for displaying, on every occasion, those armorial ensigns under which he had gained so much glory in his expedition against the insidels: those who had served with him in that warfare, likewise prided themselves in bearing such distinguishing emblems and devices as they had used on that occasion: their issue adopted the idea; and holding it as a great honour to retain those badges, which their fathers had worn in the holy war, not only bore them during their lives, but transmitted them to their posterity as permanent marks of family distinction. In consequence of this, the great lords and principal gentry did not only continue those badges and marks on their shields, but, in order to be better known and distinguished, had the like badges and devices depicted on the breasts and backs of the tunics and surcoats which they were over their armour, as also on the caparisons of their horses. This fashion of surcoats, spread over their coats of mail, and reaching down to their heels, Sir William Dugdale, from John Rous, informs us, commenced in the reign of King John; but it certainly was of an earlier date, and introduced about the middle of the twelfth century; fince we find the figure of Galfridus Earl of Richmond, who died anno 1186, represented in that dress on his seals . Arms, having thus increased and become hereditary, soon acquired fuch an accession of estimation and importance, that they were sometimes transferred, as testimonies of favour and affection, from the legal possession to some other person +; and being no longer assumable at pleasure by any man whatsoever, they came to be considered as proper remunerations of merit, valour, and good services performed; fo that princes, kings, emperors, and their generals and commanders, whilst in the field, as Guillim observes I, "bestowed them on mar-" tial men, whose valourous merits, even in justice, required dae " recompence of honour answerable unto their worthy acts; the re-" membrance whereof could not better be preserved and derived unto of posterity, than by these kinds of honourable rewards." In imitation of this practice, several great earls assumed to themselves the privilege of granting, by their letters patent, particular arms, together with titles and places of dignity, to the inferior gentry, and fuch persons as they deemed meritorious, although not ranked among their immediate tenants and dependents §.?

We shall insert one quotation more, because to many of our Readers it may appear curious. It respects the origin of the

office of Herald.

" We learn from Bertrand Caprioli ||, and others, that anciently it was customary for the Emperors to take under their more immediate care and protection, such of their best, most experienced, and valiant foldiers of gentilitial birth, as had been either grievously -wounded or maimed in their wars, and to provide them with victuals and all forts of necessaries for their support; that these soldiers were distinguished by the appellation of Veterani, or veterans; that great respect was paid to them, as well on account of their ancient descent, and experience in feats of arms and matters of warfare, as of their having hazarded their lives in the service of the Emperor and the

Public; and that the undertaking and profecution of fieges and engagements, and the conduct of all other military affairs, were carried on by their advice, and under their direction. On these accounts, the frequent attendance of the Veterani on the persons of their imperial masters became necessary; and the affistance they from time to time afforded, soon encouraged the emperors to employ them in carrying messages unto, and negotiating and settling matters of dispute with, their enemies and rebellious subjects. As, on these occasions, they observed the most prosound secrecy and honour, never betraying or divulging the state and condition of the one party to the other, they established their reputation with people of all ranks and nations, to whom they were sen', insomuch that, by general consent, they passed freely, unmodested, and respected, through the countries and armies of the princes with whom their master was at war, and were by those princes received, treated, and dismissed with safety, civility, and esteem.

"The institution of justs, tilts, and tournaments, which originated in Germany, seems to have opened a new field for the employment of the Veterans. The practice of those trials of skill and prowess was effected a proper and honourable school and seminary, in times of peace, for young gentlemen to learn initiatory exercises fit for a military life; to keep them from floth and idleness; to habituate them to the use of arms; and to rouse in them a spirit of emulation, and thirst after glory, whereby they might acquire honour to them-selves, and benefit to their country. But at the same time it was neceffary, that those exercises should be performed under due regulations, and the inspection of such persons as were best qualified to manage and conduct them. The task therefore naturally devolved upon the Veterans, who, from their former course of life, could bekt judge and determine on those matters, and who, from their necessary acquaintance with families and persons of the nobility and gentry, and the characters of each individual, knew whether they were properly admissible within the lists, no one being permitted to enter into them, against whom there was any suspicion of reproach, that i., who was supposed to have committed any action unworthy of a gentleman; a method of exclusion, which was looked upon as a proper motive to polish the manners, and give an inoffensive elegance of behaviour, in an age when all young gentlemen were eager to get a reputation by their address in tilting. The feudal system, as hath been herein before observed, which began to spread itself over the western and northern parts of Europe, nearly about the same time that tilts and tournaments became fashionable, had introduced and established tenures by knights service; the holders of lands under which tenure, according to the condition thereof, and the quantity of land held by them, were obliged to furnish a stated number of knights or military horsemen, ready to engage in the support and defence of their prince and country. Those tenants, in order that they might readily be known and diffinguished from each other, seerrally assumed some particular device or token, and bore it upon their respective banners, surcoats, and shields; and as no other perfons were then deemed to be noblemen or gentlemen, such devices, afterwards called arms, became the gentilitial tokens and enfigns of

the families who had so assumed them. In like manner, the challengers who offered to engage in tournaments, tilts, and justs, in proof of their gentility, hung up, at the entrance of the lists, shields charged with their devices and symbols; as did likewise the acceptors, no one who had not a certificate from the Veterans, of his being a gentleman, and of which his device, symbol, or arms, was the criterion, being permitted to tourney. Hence therefore a new branch of business fell into the province of the Veterans, they being under a necessity of making themselves acquainted, not only with the different ensigns of princes, but with the distinct devices each family had assumed and arrogated to itself, and of preventing such confusion as

might arise from bearing them improperly.'

Mr. Edmondson relates many curious and interesting facts concerning the history of the middle ages: his authorities are faithfully cited; and he scems not to labour under any defect of materials: but we must observe, that these materials are not always arranged in the happiest manner. The performance abounds with useless repetitions; the style is generally careless and inelegant; and there is such a deficiency of taste in every part of the work, that whatever rank Mr. E. may hold as an HERALD, he is not entitled to the most honourable distinction as an AUTHOR. Even in the chapter which treats of the blazoning of arms, or of the principles of Heraldry, confidered as a science, we meet with many terms in the beginning of the discourse, which no reader who is not already acquainted with the science which Mr. E. means to teach him, can be supposed to understand. He appears to be totally inattentive to the simplest rules commonly observed in the art of book-making. a copious Table of Contents, but without any reference to the pages where the particulars are to be found. Some parts of the Armorial science are explained by engravings. The Reader is directed to look at Figure I. but is not told where this figure is placed. After turning over the first volume to no purpose, he concludes that his copy is imperfect; till by accident he looks into the second volume, and there finds the figures illustrating what is faid in the first. Such inaccuracies are peculiarly unfortunate in a work which is recommended to our attention as a magazine of useful facts. The great excellence of a magazine is, that, as we have occasion for its contents, we can readily find them.

Notwithstanding these desects (which we are sorry to observe), Mr. Edmondson's work must be considered as the most full and camprehensive, and consequently the most alefal Body of HERALDRY, which this country has yet produced. The undertaking was vast, and expensive; and, on the whole, it will probably be long before we shall see it excelled by any other production of the kind.

Q

ART.

Rev. Sept. 1780.

ART. XI. The Candidate, a Poetical Epifile to the Authors of the Monthly Review. 4to. 1 s. 6 d. H. Payne. 1780.

O usual is it for a disappointed Writer to vent his spleen upon the Reviewers, that we sully expected the poem before us, judging from its address, had been an effusion of that angry passion. It seems, however, we were mistaken. It is published, says the Author, with a view of obtaining the opinion of the candid and judicious Reader, on the merits of the Writer as a Poet; very sew, he apprehends, being in such cases sufficiently impartial to decide for themselves. And, as to critics of acknowledged merit (we thank him for the acknowledgment), it is addressed to the Monthly Reviewers.

The situation which we are drawn into by this address, is such as might bring upon us, on the one hand, the imputation of moroseness, should we not be softened by a compliment which sew patrons can withstand; and on the other, should we treat this epistle with a lenity which the strictest impartiality would not justify, it might reasonably be suspected, that we had suspected our judgment to be duped by flattery. To avoid, therefore, every imputation or suspicion of either kind, let the Poem speak

for itself.

Say then, O ye who tell how Authors speed, May Hope indulge her flight, and I succeed? Say, shall my name, to future fong prefix'd, Be with the meanest of the tuneful mix'd? Shall my fost strains the modest maid engage, My graver numbers move the filver'd fage, My tender themes delight the lover's heart, And comfort to the poor my folemn fongs impart? ' For O! thou Hope's, thou Thought's eternal King-Who gav'st them power to charm, and me to sing-Chief to thy praise my willing numbers soar, And in my happier transports I adore; Mercy! thy softest attribute proclaim, Thyself in abitract, thy more levely name; That flings o'er all my grief a cheering ray, As the full moon-beam gilds the watery way. And then too Love, my foul's resistless lord, Shall many a gentle, generous strain afford, To all the foil of footy passion blind, Pure as embracing angels, and as kind; Our Mira's name in future times shall shine, And-though the harshest-shepherds envy mine. 'Then let me, (pleasing task!) however hard, Join, as of old, the prophet and the bard; If not, ah! shield me from the dire difgrace Chat haunts our wild and visionary race: Let me not draw my lengthen'd lines along, And tire in untam'd infamy of long,

Leff,

Lest, in some dismal Dunciad's suture page,
I stand the Cibber of this tuneless age,
Lest, is another Pope th' indulgent skies
Should give, inspir'd by all their deities,
My luckless name, in his immortal strain,
Should, blasted, brand me as a second Cain;
Doom'd in that song to live against my will,
Whom all must scorn, and yet whom none could kill.

The youth, refisted by the maiden's art, Persists; and time subdues her kindling heart; To strong entreaty yields the widow's vow, As mighty walls to bold besiegers bow: Repeated prayers draw bounty from the sky, And heaven is won by importunity; Ours, a projecting tribe, pursue in vain; In tedious trials, an uncertain gain; Madly plunge on through every hope's deseat, And with our ruin only, find the cheat.'

The Author of this Epistle; of whose merit our readers may probably by this time form no unfavourable opinion, will not, we are persuaded, think we mean

to damn (as he expresses himself) with mutilated praise, if we intimate that, beside some sew other trisling inaccuracies, his rhymes are not always regulated by the purest standard of pronunciation: for instance, shone, moon, gods, abodes, &c. These are petty blemisses, which, should a suture edition be called for, might easily be removed. And we would then also recommend to him to consider, whether his Poem, which bears evident marks of haste, might not admit of improvement in other respects; particularly one in which it is materially defective—the want of a subject to make a proper and forcible impression on the mind: where this is wanting, the best verses will lose their effect.

Art. 12. Domestic Peace and Good Humour essential to national Happiness. Addressed to a Member of Parliament. Small 8vo. 1 s. 6 d. Johnson. 1780.

argue against the use of any thing from its abuse, is one of those stallow arts of sophistry which is certain, in the end, to betray the cause it is meant to support. The present Writer, under the specious pretence of exposing the impropriety of indiscriminate opposition to the measures of government, artfully endeavours to infinuate that all opposition, especially in material points, is inconfident with the safety of the state. Is not a certain considence, says he, in ministers of state acquainted with the business of it, necessary

ceffary to its existence? Is not such a considence as is sounded in the nature of things, whatever occasional distrust may prevail, essential to our existence? According to this, let whoever will be the minister, whether a Sejanus or a Borgia, it will be the duty of every one to place a certain considence in him, as necessary to the existence of the state—Most admirable doctrine!

This being the leading principle of the book, the Reader will not be surprised if, under the insidious appearance of sanctity and can-dour, he finds our Author striving to mislead and impose upon the understanding by misrepresentation and declamatory invective, unsupported by facts, or the least shadow of sound argument. We are willing, however, to believe, that his net work of Jesuitical syllogisms is of too slims a texture to hold those fast who may chance to be entangled in it. His political creed seems to be nearly of a complexion with that imputed to a late unpopular orator at York. He is of opinion, that there is neither extravagance in the expenditure of public money, nor corruption in government; and that our refources are of confiderable magnitude. As a proof of this, he points out a tax which alone would bring in, as he tells us, two millions and a half yearly, without diffressing the subject, and which no one ought to grumble at. He, moreover, seems to think that, 'If virtue is not so enforced, as to produce a sufficient sum, yet not acting precipitately, no minister will be suffered to enjoy any degree of peace and comfort for some years to come.' But this is not all: it was left for this Writer's sagacity to discover that freedom is one great source, or at least an aggravation, of misery. We are in a less happy situation, under difficulties, than people who are not free. This is a bold word [yea, verily], but not being compelled to act in union, in danger, we increase that danger by difunion. On the other hand, being more in love with liberty, than with any other object, it may be presumed we should do more for her take; but this is a speculative idea, and exills chiefly in the minds of the virtuous few. Being enthralled by voluptuousness, what we have not the spirit to do by choice, we must perform by compulsion. The above sentiment is wrapped up with some degree of dexterity; nevertheless the solds of

<sup>\*</sup> Prov. xxxi. 29.

Art. 13. An Incredible Great Bore: a familiar Epistle, from Roger Wittol, Esq; of — College, Oxford, to Mr. John Hedgings, in the Country. 4to. 1 s. 6 d. Kearsley. 1780.

The cant words and phrases, hackney'd, on every occasion, by the bucks, the punsters, and other small wits of the age, are here strung together, like the fashionable jargon of Swift's time, in the Polite Conversation of that pleasant satirist. Swist's work was a satire in prose; Mr. Wittol gives us his fun in verse,-somewhat in Anstey's The Epittle recites the incidents which occurred in the manner. Author's excursion to London,

On one of Kemp's tits, which did up on the road .

They are rehearfed in a strain not destitute of humour, and illustrated by a frontispiece in caricature; but though the Writer's deign may have been purely to ridicule the reptile species of wit here brought into exhibition, the performance will perhaps be misconceived by many of its Readers, who may be provoked to exclaim, with the Writer himself

O'tis a curs'd Bore!"

Art. 16. An idle Hour's Amusement: being a small Collection of Poems, Sonnets, &c. and a few Imitations from Anacreon, Horace, and Virgil. 4to. 2 s. Becket. 1780. A very idle hour's amusement, indeed-Exempli gratia.

Sing who will with founding note,

In fields how mighty heroes fought, I'll fing the charms of Harriot. Ye Muses, aid each amorous thought, Till my verse with graces fraught, Shines like lovely Harriot.

Catat.

Art. 17. Panegyric. An Essay on some of the worthiest Characters in the Kingdom. 4to. 1 s. 6d. Fielding and Walker. How fond some people are of giving oblique glances at their own characters! This Writer, furely, had an eye to himself when he speaks of

> darling fons. In whom the blood of Duiness runs With Falschood's mixt; who still, in spite Of nature, and the Poet's right, Can works compose of rueful length, &c.

Rueful, indeed, is the length of this poem; it extends through three and thirty of the most unmeaning pages we ever met with. The worthiest characters in the kingdom, if we credit this Panegyrist, are Lord North, Lord G. Germaine, and Lord Sandwich! And yet, after all, we find ourselves puzzled to guess, whether, in what he fays of this triumvirate, he would chuse to be thought serious or ironical. Indeed, it is no matter: the problem (we mean with respect to the merit of the poem) is not worth folving. C-t-t.

<sup>.</sup> The Reviewer aspires to the honour of exactly one seventh part of this line.

Art. 18. Fugitive Pieces. Written by J. P. Kemble. 8vol

1 s. 6 d. Fielding and Walker. 1780. This little collection, confisting of odes, fongs, occasional prologues, &c. will, we doubt not, be acceptably received by the Author's particular friends: whether the Public in general will be amused with them, is a question we will not take upon us to answer. Though far from being first-rate performances, they are, nevertheless, sprightly, and in some degree ingenious.

Election Flights. Containing, the Nomination Day, a Letter from Timmy straightforward to his Mother, and a New

Song. 4to. 1s. 6d. Almon.

A forry imitation of the Bath Guide. The best use to which the Cambridgeshire freeholders can apply this eighteen pennyworth of trash, will be to light their pipes with it at their next entertainment.

A Second Letter from Timmy Straightforward to his Mother, containing a Description of Pot-Fair, and an Ode for the Anniversary Meeting of the Governors of Addenbrooke's Hospital, Cambridge. 4to. 6d. Almon.

Equally ingenious and useful with the foregoing flights.

Att. 21. A Letter from Mrs. Straightforward to her Son Timmy. To which is prefixed Mrs. Straightforward's Letter to the Ladies and Gentlemen of Cambridge. 4to. 1 s. Rivington. "Ne'er a barrel better herring."

Art. 22. The Modern Pantheon, a Dream. By a Lady of Quality. 8vo. 18. Bew. 1780.

This system of modern mythology is much too unmeaning to be entitled to criticism, or farther notice.

Art. 23. Poems to ber Majesty: to which is added, a new Tragedy, entitled, The Earl of Somerset; literally founded on History: with a Presatory Address, &c. By Henry Lucas, A. M. Student of the Middle Temple, Author of the Tears of Alnwick, Visit from

the Shades, &c. 4to. 10 s. 6 d. Dodsley, &c. 1779. In a most rapturous Dedication to the Queen's most excellent Majesty,' we are told, that the first poem in the collection arrived at the diffinguished honour of her Majesty's most gracious perusal; and that ' the dear intelligence naturally gave rise to the second,' which the Author flatters himself was also graciously received. After such distinction, we apprehend Mr. Lucas is little anxious for the approbation or applause of inserior critics; we shall therefore not presume to comment upon his ' Ejaculation, occasioned by seeing the Royal children on his Majesty's birth-day,' nor yet on his 'Oblation, a lyric poem, on her Majesty's happy delivery of a daughter, the most amiable Princess Sophia, November 3, 1777.

Mr. Lucas expresses great indignation at the ill-treatment he suppoles himself to have met with from the managers of the theatres, in rejecting his play of Somerset. We entirely agree with him, that he has been extremely ill-treated: though we think the objects of his resentment ought not to be the managers; who from self-interest would certainly not reject a play that was likely to succeed, but rather those 'accomplished critics, dramatic as well as classical, who, by the private estimation in which they held his tragedy,' buoyed

him up with the idea that it merited a public exhibition on the stage. Who these accomplished critics are, we are not told: one indeed in mentioned, whose authority in these matters sew will dispute; yet, in the present instance, many will suspect that, if his sentiments be rightly expressed, he is unwilling, now he has commenced courtier, to offend by his sincerity. We do not, however, suppose this to be the case. We rather think that the Author, who perhaps may be not naturally dissident, has explained some good-natured expression of the critic's with a latitude of interpretation which he never intended it should bear. People, who have had but little intercourse with the world, are very apt to mistake the forms of common civility for professions of the most inviolable friendship; and the self-sufficiency of young authors will as often mistake those unavoidable compliments, which their own vanity may have extorted, for the genuine smiles of critical approbation.

The only part of the managers' conduct which feems to require an apology, is the keeping Mr. L. nearly four years in suspence. It surely was not necessary to fit four years in judgment, before the face of such a play as the Earl of Somerset could be determined.

M I S C E L L A N E O U S.

Art. 24. A Tour through Ireland; wherein the prefent State of that Kingdom is considered; and the most noted Cities, Towns, Seats, Buildings, Leughs, &c. described. Interspersed with Obfervations on the Manners, Customs. Antiquities, Curiosities, and natural History of that Country. To which is prefixed, a general Description of the Kingdom: with the Distances between the Ports &c. on the Coast of Great Britain, and those on that of Ireland. 12mo. 3 s. 6 d. Lowndes. 1780.

To those who wish to make the Tour of Ireland by their own fire-fide, this book will be a convenient wade-merum. It fully answers to its Title. We must remark, however, that the Writer's information does not appear to be collected altogether from actual observation; he has occasionally availed himself of the labours of others who have preceded him, whose works, probably, made part of his travelling quipage.

Art. 25. A Letter to the Patentees of Govent Garden Theatre, on the Conduct of Mr. Harris, the Acting Manager. 4to. 1 s. Lambert. 1780.

Time has shown the idea, on which this acrimonious episse is written, to be ill-founded. Spirit, but rather an illiberal spirit, breathes through this composition; and we are inclined to think better of Mr. Harris, than to suppose him capable of undermining another public adventurer, the nature of whose undertaking in a manner precludes him from being considered as a competitor.

Art. 25. The Fashionable Day. 8vo. 2s. Kearsty.

The design of this pamphlet is to ridicule the fashionable misemaployment of time. Ingenious as some parts of it may be, it is written in a strain of phantastic irony that to most Readers will be more wearssome than amusing.

Art. 27. Female Government! or, Letters from a Gentleman to his Friend on the Education of the Fair Sex; with Hints for the Conduct of Men in a married State; humbly addressed to the Peereffes of Great-Britain; with all Submission inscribed to their henpecked Husbands; and now published for the Benefit of the rifing Generation of Cuckolds. 8vo. 6 d. Fielding and Walker. 1779.
If this Writer be in jest, we cannot compliment him for the felicity of his wit; and if he be in earnest, we see as little to commend in his argument. The Preface informs us, that 'it will be evident to every critic of discernment, that the composition is the language of the heart.' It may be so, for aught we can discern to the contrary: - and so much the worse for the Author, in our estimation; for old as we are, we have not forgotten the endearments of youth. The delightful remembrance of them still plays round our hearts, and beams a mild lustre on the evening of life. This pleasure we should never have experienced, had we viewed the most lovely part of the creation with the "jaundiced eye" of this gloomy and malignant Writer, who, under pretence of supporting domestic tranquillity, would erect a domestic tyranny—break the pleasing associations of the fexes, under pretence of supporting conjugal honour-and make wemen slaves, that they may not be tyrants nor strumpets !- O righteous judge!

Art. 28. The Beauties of Shakespear, regularly selected from each Play, with a General Index, digesting them under proper Heads. Illustrated with Explanatory Notes, and similar Passes from ancient and modern Authors. By William Dodd, LL. D. The 3d Edition, with large Additions, and the Author's last Corrections.

rections. 12mo. 3 Vols. 9 s. sewed. Macgowan. 1780.

In our 6th volume, p. 316, we commended, to the Public, the first edition of this work, as a valuable miscellany. The collection is now much improved, as well as considerably extended. The Editor assure is not many address, that Dr. Dodd had, during the latter part of his life, made many considerable additions to this book; that he had finished his plan; and had got more than one half of it printed, before his unforturate death.—Poor Dodd! if ability could compensate for the want of virtue, thy sate would, indeed, be justly lamented, and this Editor would stand in need of no apology for the farcastic terms in which he has inscribed these volumes to the Earl of Chestersield.

#### DRAMATIC.

Art. 29. The Manager in Distress. A Prelude on opening the Theatre-Royal in the Haymarket, May 30, 1780. By George Colman. 8vo. 118. Cadell.

A theatrical jeu d'ofprie, taking a fair advantage of many circumflances, temporary and local, which are handled with much address and vivacity. It contains, likewise, some materials worthy of a more regular drama. The character of Bustleton, in particular, would figure as no inconsiderable personage in the proups of a comedy.

Agure as no inconsiderable personage in the groupe of a comedy.

Art. 30. Fire and Water! a Comic Opera: in Two Acts.

Personned at the Theatre Royal in the Haymarket. By Miles Peter Andrews. 8vo. 1s. Cadell. 1780.

Much of this opera is so very applicable to some late events, that

we should without scruple announce it as written in consequence of them, had not the Author informed us, in a presatory advertisement, that, 'however singular it may appear, the piece was actually written, and delivered to the Manager, long before any of the late disturbances.' This may, in general, be true; but we cannot help suspecting, that some particular passages were afterwards thrown in by the Author or Manager.

There is no great dramatic force in the fable, persons, or dialogue. The character of Ambuscade is somewhat novel and whimsical. The

fongs are tolerable.

Art. 31. A Widow and no Widow. A Dramatic Piece of Three Acts. At it was performed at the Theatre Royal in the Haymarket, in the Year 1779. Written by Paul Jodrell, M. A. 8vo.

1 s. 6 d. Conant. 170.

The widow's suitors, as well as some other personages of this little drama, are well known to the Public. The Caledonian Traveller to Abyssinia, the patriotic Doctor of Divinity, the Constitutional Booksseller, and the penurious Peg Pennyworth, will tempt the Reader to subjoin other names to them, besides those of the actors that stand opposed to those characters among the Drassatis Persona. The artist is rather a coarse painter, but commonly hits off a striking likeness.

Nove Ls.

Art. 32. Alwyn, or, the Gentleman Comedian. In Two Volumes. 12mo. 6s. Fielding and Walker. 1780.

A vulgar narrative of uninteresting incidents in the peregrinations

of a strolling player.

Art. 33. The Indian Adventurer: or, the History of Mr. Vanneck; a Novel, founded on Facts. 12mo. 3 s. bound. Lane. 1780.

Still more infipid and vulgar than the preceding article, and withal

insufferably coarse and indelicate.

Medical.

Art. 34. An Introduction to the Theory and Practice of Surgery.

By William Deafe, Surgeon to the United Hospitals of St. Nicholas and St. Catherine, at Dublin. Vol. I. 8vo. 3s. Murray.

1780.

Mr. Dease begins his work with giving a slight historical view of the progress of surgery, from the most remote to the present time. He then, in his 1st section, presents a general view of the human body and animal occonomy, as connected with the practice of surgery. In the 2d, he proceeds to a general account of the proximate caule, symptoms, distinctions, and treatment of external inflammations. Sect. 3d treats on Suppuration. Sect. 4th, on Gangrene. Sect. 5th, on Ulcers; and Sect. 6th, on Wounds in general. After all these Sections, which are short and concise, follow a number of Notes and Illustrations, consisting of cases, and practical remarks elucidating and confirming the doctrines laid down in the former part of the work. This method seems to us, on the whole, judicious and prositable; since, in teaching the elements of any science, there is nothing so serviceable as apposite examples. We have already had

Review for April, 1778.

occasion to soeak favourably of Mr. Dease's professional knowledge and the present publication affords additional proof of his ability. We cannot compliment him on the propriety and correctness of his language.

Art, 35. The Gout and Rheumatism cured or alleviated; proved by well authenticated Cases of the most painful Fits being removed in a sew Days. With Reslections on the Causes of the Gout, and the Danger of altering the Diet in Chronic Complaints. By William Rowley, M. D. 8vo. 28. Richardson, 1779.

Our old acquaintance, Dr. Rowley, who used to claim great merit with the Public for generously allowing the whole faculty to participate in his wonderful discoveries, has at last condescended to be the harbinger of as arrant a nostrum as any advertised in the daily papers. It is an elixir, of Persian or Arabian origin (forsooth) with which a bath and cataplasm is prepared for gouty limbs. Its virtues are trumpeted forth both in French and English, and supported by cases, with names to them. Doubt now who can! As for Dr. Rowley's thoughts and restedions, they are rational enough, but would searcely have been worth printing, but for the purpose of ekeing out an advertisement into a pamphler.

- Art. 36. An Account of the Methods pursued in the Treatment of Cancerous and Scientificans Disorders, and other Inducations. By J. O. Justamond, F. R. S and Surgeon to the Westminster Hospital. 8vo. 3s, Cadell, 1780.

The Public is obliged to this gentleman for his assiduous and un-

wearied endeavours to discover a cure for the dreadful disorders here. treated of; at the same time, we have the mortification to find that the advance he has made in this object is very inadequate to the defired effect. The principal remedies tried by Mr. Justamond were, first, a German recipe, which chiefly consisted in a martial tincture with fal ammoniac, used as a wash round the ulcer, with the view of . \* Toftening the indurated parts-secondly, a hemlock bath-and thirdly, a preparation of arienic, used as a caustic to the surface of the ulcer. In this last mineral, Mr. Justamond thinks, is to be found the only true specific against the cancerous wirus; but unfortunately, its use was attended with so much pain, and with such noxious effects on the nervous f. stem, that he was feldom able to continue its application long enough to produce any important advantage. As an internal medicine, the Writer found the martial flowers in large doses particularly serviceable in mending the habit; and he had occasson to observe its peculiar esticacy in that common and troublesome disorder of the semale sex, the fluor albus. On the whole, however, he candidly acknowledges that he never succeeded in healing any ulcerated cancer, besides the first described, by these methods a except in the instance of one other cancer, which proceeded from another disease, and was treated in a different manner.

Mr Justamond appears much attached to the opinion that cancers are produced from insects, or the germina of them taken up from the air by the lymphatic vessels; a theory which has prevailed in Germany and Italy. How far this notion corresponds with the various phænomena of the disease, we shall leave our Readers to judge for themselves.

The

The Writer concludes with some observations respecting the methods of treating coagulations of milk in the breasts; in which he adduces some instances to shew that stimulant and discutient applications, as particularly a folution of fal ammoniac with the addition of spirits, succeed better in these cases than emollient poultices.

As facts fairly and accurately related are always useful, though they may not have turned out as we should have wished or expected; we doubt not but some instruction may be derived from the present publication, which is written with candour and intelligence.

Religious and Controversial. Art. 37. A Reply to Mr. Gibbon's Vindication of fome Passages in the Fifteenth and Sixteenth Chapters of the History of the Decline and Fall of the Roman Empire Wherein the Charges brought against him in the Examination are confirmed, and further Instances given of his Misrepresentation, Inaccuracy, and By Henry Edwards Davis, B. A. of Baliol College,

Oxford. Octavo. 3 s. fewed. Dodsley.

Mr. Davis introduces his Reply with acquainting his readers, that he contends not for personal victory, but for the establishment of a just cause; with acknowledging that he has been mistaken in some points, and too bold in some of his affertions; and with mentioning some things that may be urged in extenuation of his offence. But while he freely confesses some errors that he has fallen into, in his Examination of Mr. Gibbon's References, he still contends for the substantial grounds of the general charge; he still insists, that many inaccuracies remain unnociced, many mifrepresentations unaccounted for by Mr. Gibbon; enough, he is confident, were he even to give up without a dispute, all that his adversary has called in question, to convince the world, that he has totally fet aside the Historian's boasted claim to the merits of accuracy and originality.

Mr. Gibbon complains loudly, that Mr. Davis has repeatedly applied to him, some of the barshest epithets in the English languagethat he has prosecuted a religious crusade—with implacable spirit, and with acrimony of slile. In answer to this Mr. Davis says, that some persons may, perhaps, think, that warmth of expression is in this case the just and proper language of the heart, and gives energy to fentiments which flow from the powerful conviction of truth. If for they will not be disposed, he tells us, to pass a very severe censure upon the indignation which a young Writer felt, when encountering an Author, whom he had but too good reason to consider as an underminer of that religion, on which mankind may build better hopes, and which affords more valuable objects of them, than Mr. Gibbon's

unsubstantial bubble of FAME.

After making some general remarks on Mr. Gibbon's Vindication, Mr. Davis proceeds to make his defence; and endeavours to confirm his former charges. He tells us, that there are twenty-nine instances of misrepresentation charged upon Mr. Gibbon in his Examination, to which no reply is made in the Vindication; that he has been convicted of only sight trifling mistakes out of fixty eight inflances; for that there are still remaining fixty substantial proofs of mifrepresenta-

<sup>9</sup> See Review, Vol. LIX. p. 199.

sion, he says, which Mr. Gibbon, with all his artistice and plausibi-

hity, will find it difficult to confute.

Having shewn how the balance stands between him and the Historian, Mr. Davis proceeds to make some remarks upon what Mr. Gibbon has advanced, upon the mild genius of polytheism, and the religious barmony of the ancient world; and then goes on to consider what is said of the Jews, who are placed by Mr. Gibbon in the most hateful and contemptible light. In order to consute what is alleged against them, our Author gives an epitome of the Jewish history, during their captivity under the Assyrians, Medes, and Persians, and endeavours to shew that the Jews were not distinguished from other nations by an intelerant zeal; that they were not subject to the Assyrian empire, as the Babylonian and Assyrian were not the same people; and that they did not languish for many ages under the Persian monarchy, the most despited portion of their slawer.

He concludes his Reply with taking some notice of Mr. Gibbon's plagiarism; and here he tells us, that if he had directed his studies so the perusal of Tillement, Voltaire, Crewier, Le Beau, and other French historians, he should have discovered still more, how little Mr. Gibbon had consulted original materials; or rather proved, that it really was his invariable practice through the whole of his History, to transcribe the moderns, and by their aid and guidance to make a parade of the learning of the ancients.—Such of our Readers as are unprejudiced, and competent judges of this matter, will, we apprehend, give little credit to this affertion; as for us, we are fully convinced, that Mr. Gibbon, though he has occasionally consulted and frequently borrowed from moderns, is well acquainted with ancient

Before we conclude this article, we think ourselves bound in justice to Mr. Davis, to acknowledge that his Reply bears evident marks of learning, judgment, and critical acamen; and that, though several of the instances of mistake and missepresentation, which are charged upon his adversary, are trisling, yet there are others which are of considerable importance, and well deserve Mr. Gibbon's serious attention.

## S сноот-Воо к.

Art. 38. The Scholar's Guide to Arithmetic; or, a complete Exercise Book for the Use of Schools. With Notes, containing the Reason of every Rule, demonstrated from the most simple and evident Principles; together with general Theorems for the more extensive Use of the Science. By John Bonnycastle, private Teacher of the Mathematics. 12mo. 2s. Johnson. 1780.

The Author informs us, in his preface, that we are not to look on this book as a complete treatife on arithmetic, but only, as 'a short methodical tract, drawn up for the purpose of teaching.'—We assure our readers that this is a modest account; and that many masters may profit by what is here offered to them for the use of their scholars. In pursuance of this plan, of writing a book for the use of schools, he has been very careful to make all his definitions and rules as concise as possible, consistent with that simplicity and clearness which is absolutely necessary in things of this nature; and afterwards to exemplify those rules with a sufficient number of examples, in selecting of which.

which, he has made choice of such as are most likely to occur in business. He has also shewn, with great clearness and perspicuity, the reason of each rule, in notes; and, in some instances, has illustrated and explained the examples, when he had reason to apprehend any difficulties would be sound, or where any disputes have arisen between former Authors: and in this part of his work, Mr. B. has shewn great ingenuity and judgment.

By confining every thing of this nature to the notes, Mr. Bonny-castle has been enabled to keep his text free from long explanations, so that nothing is to be found there, but what the learner ought to transcribe, and fix in his memory; a matter which seems to have been too much neglected by most of those Authors who have undertaken to write on the subject of arithmetic for the use of schools. On the whole, we shall not hesitate to declare, that we think this little book will be sound very useful, both to the teacher and learner.

## CORRESPONDENCE.

We are forry that we cannot, without forfeiting our own characters, gratify the withes or our anonymous correspondent, who figns himself "A Friend to candid Criticism;" and who expresses him hopes that we shall not be averse, in our next Review, to correct the injustice of our too precipitate centure of the Philosophical Inquiries into the Laws of Animal Life, by Dr. Hugh Smith of Hatton Street, in the 8th Article of our Review for July last.—The Reviewer inflicted that censure with all due detiberation;—much could not be necessary, in a case so very plain:—and he appeals to the Article complained of, and, with still greater considence, to the work itself, for the propriety and justice of it. In fact, the Article alone is abundantly sufficient to shew the complexion of this Experimental Inquiry. From the sew specimens there given, the philosophical reader will be enabled to form a faint, but just idea of the pompous inanity of the whole performance; and to judge for himself, with respect to the sar fetched and illogical conclusions drawn from the sew and trissing experiments contained in it.

These conclusions would not follow, were we to grant the Author every one of his data; and even to allow, ex abundanti, that men, and other land animals, like fifter, actually carried about them an air bladder, which had hitherto eluded the researches of the most prying Anatomists. Besides, though the force of wapour, acted upon by heat, be immense; that of air, rarefied by a heat much exceeding that of animal bodies, is comparatively very trisling; as hath long ago been shewn, by the experiments of Amontono, Muschenbroeck, Robins, and others.

Our Correspondent attempts to reconcile us to the Author's notions concerning the pulse-glass; to which he might have added the fire-engine: a machine to which the Author likewise refers; and in which, motion is undoubtedly produced on the same principles. He says—' The precaution taken to exhaust the pulse-glass of what is called common air, does not produce an absolute vacuum; but makes way for a purer, or more rarefied air to occupy that space which it has left: and if you will call Dr. Franklin's invisible vapour,

pour, vital air, I fancy Dr. Smith and you will differ very little in your idea concerning it.'—We can never agree to call an absolute vacuum (quoad air) or a megation of air; by the title of air; event shough a high-sounding epithet should be affixed to it: and we are forry that our Correspondent, and the Author, should now first learn from us, what has been long known with respect to the site-engine; and is equally true with regard to the passe glass, when properly constructed; that the motions in both these instruments are not caused by air rarested by heat; but by a highly elastic vapour, which has previously expelled the air contained in them.—But we forget that it is no part of our duty to teach philosophical ledurers; or their friends; the distinctive properties of air and vapour, that are known to every gree in philosophy; though it is our bounden duty to expose the false pretentions of conceited and uninformed writers.

Our Correspondent, very properly, and with a commendable degree of seeling, observes, that though our a duty to the Public frequently requires us to censure the performances of our cotemporaries, it is nevertheless an invoidious office, and must be often painful to an ingenuous mind.'——When ignorance is accompanied with modesty and diffidence,—a very rare combination!—the critic's situation is peculiarly distressful; but the Reviewer could not possibly seel any qualms

arifing from such a combination on the present occasion.

Our candid Correspondent has thought proper to throw out a hint, as if nothing less than 'personal malevolence' could have distated the criticism of which he complains.—This is the usual plea and resource of bad Authors.—But, that no innocent persons may fall under the Author's suspicion, he solemnly declares, that he had no other assurance even that such a person existed, as Dr. Hugh Smith of Hatton Street, than what he derived from seeing that name assixed to this Work, and from the recollection of the numerous eulogia, or, as they are vulgarly called, pussi, which he remembers to have formerly read, with difgust, in the newspapers, relative to him, and his Leanres on the Phi-

Topophy of Phyfic.

In the same respectable channels—so well calculated to drag forth modest but conscious merit to the notice of the Public, and so excellently adapted to philosophical discussions—the praises of Dr. H. Smith have again been celebrated, in a regular series of letters; if not by Dr. Hugh Smith himself, at least by a person wonderfully resembling him in empty solemnity, in his skill in pneumatics, and in his logic. This personage, who styles himself William Chambers, alluding to Dr. H. Smith's 'late discoveries' gives us broad hints, that the world is 'not to expest more than one' such 'important discovery in the same branch of science, in the course of a century' to come: and to add the weight of numbers to his testimony, he produces an applauding certificate, granted to the Doctor by a certain drinking club, as the Reviewer has been informed, who, it seems, assemble in Pigsser, or thereabouts; and which be calls The Mathematical Society.

Not content with this felf applause, as we cannot help confidering it, this other Sosia abuses his Reviewer, in a systematic form, through four letters, and in terms the most indecorous;—such as modern friendship could scarce extort from the most feeling breast, in behalf of the dearest injured friend. In a coarse and vulgar strain

of exultation over the supposed ignorance of the Reviewer, he principally dwells on two instances. The philosophical attainments of the fei disant Mr. William Chambers may be judged of from these two specimens, which we shall condescend to transcribe.

To expose the ignorance of the Reviewer, he first tells us, that the vapour or elastic steam arising from the boiling studie in the pulse-glass cannot expel all the air contained in the instrument; because, saith he, 'the atmospheric air is constantly pressing in.'—Dr. H. S. ought to know, that a drop or two of water, or even a globule of mercury, will, by a boiling heat, be converted into an elastic vapour, not only capable of expelling all the air out of a vessel, but of raising even a greater pressure than that of the atmosphere; provided every part of the vessel has acquired such a heat as will suffer the vapour to retain its elastic form: and that if any air be lest in the pulse-glass, the sense

fibility of the inftrument will be impaired in proportion.

In the fecond instance, the Reviewer is asked, with the most risible folemnity, what Mr. W. C. calls one ferious question. It is a curious one at least.—' How could the operator conjure all the air out of the pulse-glass without breaking the instrument? The weight and pressure of the external atmosphere, under such circumstances, would certainly crush the glass to atoms. Blush, Critic, and never more talk of philosophy!'—Dr. H. S. or Mr. W. C. may, possibly, if ever they attended a lecture on the air pump, have seen a standard pane of glass broke under these circumstances: but we could not have supposed, that any person who had publicly lectured on philosophy, or even the humble writer on philosophical subjects in a newspaper, could have been so grossly ignorant, as not to know that the arched form of even a thin glass bulb would protect it from even a greater pressure than that of the atmosphere.

The extreme familiarity with which the Reviewer has been treated by the learned apologist of Dr. Hugh Smith-whoever he may beintitles him, he conceives, to look up to Dr. H. Smith himself on this occasion; and particularly to advise him to leave off, for the future, this unbeseeming practice of advertifing himself as a philosopher; and of abusing those whose aim it was to instruct him. philosophical discovery of importance cannot possibly stand in need of the fostering hand of a Gazetteer to sustain it; much less can it require a strain of abuse, that disgraces even a modern newspaper, to Support it; against the censure of a- deceitful, envious, vain, or necessitions, ignorant, malicious, scurrilous, malignant, knavish, BLOCK. HEAD of a Reviewer.'- For such is the style, nay the very words, (only occasionally changing Mr. W. C.'s substantives into adjectives) which this foul-mouthed Apologist of Dr. H. S. has thought proper to adopt, in return for the exemplary urbanity of the Reviewer towards bis friend.

Since the preceding observations were written, Dr. H. Smith's Syllabus has been perused by the Reviewer, who had but just before been reminded of the decisive sentence of condemnation passed upon it, by an associate, in the Monthly Review for July 1778, page 68. Mr. Chambers has committed a most unfortunate blunder, in exciting the Reviewer's attention towards that forgotten production; and particularly in arranging him of 'appardonable effrencesy,' for having

dared to own that he had not read it!-Two examples, extracted from this quintessence of the Lecturers on the Philosophy of Physic, will

furnish a sufficient specimen of this curious production.

This teacher of philosophy betrays such an ignorance of the nature of those bubbles which continually rise from heated liquors, as to mistake them for air: - and he exhibits a still more deplorable inflance of ignorance, with respect to the nature of that common in-Arument, the thermometer; by teaching his enlightened auditors that, on the thermometer's being put into cold water, the mercury defcends, because ' the air in the quickfilver is more compressed;' and that, on applying heat, ' the AIR contained in the quickfilver is as quickly expanded, &c.'-Such are the ' late discoveries' of Dr. H. 8.; the like of which, we believe, to use the words of Mr. W.

Chambers, ' we shall not see in a century to come!'

The Editor of the Monthly Review having likewise been called apon by Mr. W. Chambers, as being 'the immediate responsible man; and conjured, with a folemnity truly ridiculous, ' to wipe off this foul flain-and see that a public atonement be made; - presents his compliments to him (not forgetting the fociety in Pig-street, or cliewhere), and affures him, that though he may possibly be as much in the dark about air and vapour, as be appears to be; yet his well-grounded confidence in the capacity and candour of the Reviewer whom he has thus grossly abused (as well as of the gentleman who damned the Syllabus), will not suffer him to doubt, for a moment, of the justice, propriety, and even mercy, of their criticisms.—Securely resting on their well-known abilities, he feels the most sensible pleasure, in being the instrument of executing critical justice on assuming pretenders to science, of whatever denomination, and their equally ignorant tools, or dupes: especially when, depending on the ignorance of the majority of newspaper readers, with respect to philosophical subjects, they fearlessly vilify their proper judges; who have, in conscience, and ex efficio, been obliged to condemn their worthless productions.

N. B. Our readers are defired to fill up the following biatus, which, by some accident happened in our account of Dr. Smith's Inquiries, in the Review for July, p. 52, I. 2d.—After the words—' to present his notions on this subject,' add, ' with a little more precision, and less solemnity.'

## • Mr. DARWIN's posthumous publication in our next.

We are obliged to Dr. G. for the following information, viz. That it is Lord Gardenston \*, one of the Lords of Session in Scotland, who has established the linen manufacture in the village of Laurencekirk +, which formerly confisted of only a few houses: but that fince his Lordthip's attention to the place, it hath greatly increased, and is in a very flourishing condition. It is now a free and independent burgh of Barony.

Mentioned in the Review by the name of Francis Garden. + See the 19th Article of our last month's Catalogue.

## THE

## MONTHLY REVIEW,

For OCTOBER, 1780.

## **\$**

ART. I. A General Dictionary of the English Language. One main Object of which is, to establish a plain and permanent Standard of Pronunciation. To which is prefixed, a Rhetorical Grammar. By Thomas Sheridan, A. M. 410. Two Volumes. 11. 11 s. 6 d. Boards. Dodsley. 1780.

S this work feems to be the last of several publications by the same Author, all of which tend to a design of carrying a long concerted plan of his Dictionary into execution, before we can properly estimate the value of the present performance, it will be requisite to have some retrospect to his former; treatises on the subject before us.

About twenty years ago, Mr. Sheridan published an essay, entitled "British Education," in which he endeavoured to prove, that most of the evils complained of in this country arose. from an erroneous and defective education; and he enlarged particularly on the bad consequences attending the neglect of a studying our own language, and the art of elocution. cultivation of these studies was insisted upon by him, as of the highest importance in promoting the cause of religion and virtue; in propagating knowledge, and the refinement of writing. in poetry and profe; and in raising the liberal arts to any degree of perfection among us. When this work first appeared,: it was much read and admired by many persons or tatte and judgment; among whom the late Lord Chestersield was very warm in his commendations of it, as may be seen in some of his Letters. The novelty of the matter contained in it, and Mr. Sheridan's original manner of treating his subject, excited curiosity. But though no particular attempt was made to confute his doctrine, yet his conclusions, upon the whole, were so very surprising and extraordinary, that a general incredulity prevailed with re-Vol. LXIII,

gard to them, and the scheme was considered as visionary, and

impracticable.

Among many objections made to the practicability of the design, none was more common among the literati, who had cultivated only the written language, and had paid no attention to the art of delivery, than that it was impossible to teach elo-cution as an art. Of this our ingenious Author took notice in a pamphlet published soon after, entitled, "Heads of a Plan for the Improvement of Elocution, &c." in which he fays-With regard to the second article, that of rendering the acquirement of a just, forcible, and graceful delivery, easy to such as shall apply to it, though it be generally allowed to be a most desirable object, yet sew think it a point that can be compassed. Many will not allow that elocation either is, or can be taught as an art. That it was fo, and the most favourite art among the Greeks and Romans, cannot be denied. What has been, may be. But to those who say, that because it never has been taught or practifed as such amongst us, therefore it never can be, I shall not attempt an answer.

Mr. Sheridan, however, did not long rest upon that argument; but, in order to shew the practicability of the defign, delivered, and afterwards published, a course of lectures on Elocution, in which he laid open the principles on which that art is founded, and the general rules by which it is governed, under the several heads of articulation; pronunciation; accent; emphasis; tones or notes of the speaking voice; pauses or stops; and key or pitch, or management of the voice. In all these he made it his business to expose the ignorance, and detect the errors, of the few literary men who had written any thing upon the subject, and to establish his own principles and rules upon a folid foundation. These were new, and the result of his own investigation. In this course our learned Writer pursued the analytic method, as being the most proper to gain the attention of the adult, for whose use the Lectures were chiesly intended.

Our Author having thus established his theory, the next thing wanting was to assist, in the practical part, those who were defirous of cultivating the studies recommended by him. With this view, he published a course of lectures on the Art of Reading, in two parts; one, respecting prose; the other, verse. In the first of these, he pursues a method opposite to that of the former, proceeding in the synthetic way, in order to teach the art regularly, from the first simple elements, to their most extended combinations. In the whole of this part, we discern the same original train of investigation, the same evidence of the truth of his positions, and the same detection of the errors of preceding writers. In the second part, Mr. Sheridan endeavoured to lay open the whole prosody of our language, on principles which,

he thought, had never been touched upon before. But it is certain, that Mr. Say had some, though not a sufficiently determinate, idea of them, and that Mr. Mason, in his Essay on the Power of Numbers in Poetic Compositions, has stated part of these principles with no small degree of perspicuity, though not in so accurate and copious a manner as our Author has done: and particularly, he was mistaken in making accent the sole standard of English quantity, without considering how much the beauty and variety of our versification depend upon emphasis. Mr. Sheridan, we are satisfied, had never seen what

had been written upon the subject by Say and Mason.

Our ingenious Writer's last Work seems designed to crown the whole, by laying open a method of teaching a just delivery of the English tongue by the organs of speech, and establishing an obvious, general, and permanent standard of pronunciation. This Work confifts of two parts. The first is called a Rhetorical Grammar, as treating only of the spoken language, to distinguish it from those which treat only of the written. The intention of this Grammar will be best explained in the Author's own words: 6 The great difficulty of the English tongue lies in the pronunciation; an exactness in which, after all the pains they can take, is found to be unattainable not only by foreigners, but provincials. The chief cause of this has been the want of method in teaching it, by a well digested system of rules. Some of our grammarians, indeed, begin their work with a definition that would lead us to expect a regular treatise on the subject. They set out with telling us, that grammar consists of two pasts; Orthopy, or the just manner of pronouncing; and Orthography, or the just manner of writing words. So that they define grammar to be the art of teaching people to speak and write correctly, according to the custom of those whose language we learn. But after having made this distinction, they scarce take any notice of orthoepy, and their whole pains are employed about the other article, orthography. They were deterred from this part of the work, by the immense difficulty of the undertaking; and as there never has been any public encouragement to fuch a work, either by focieties, or royal munificence (means which produced the regulation and refinement of their several tongues in neighbouring countries), there has been no one hardy enough to engage in so laborious an undertaking upon a precarious prospect of reward. This is the task on which I am now employed, to restore the first and noblest part of grammar to its just rank and power, and to reduce the other to its due state of subordination: to make the spoken language, as it ought to be, the archetype, of which the written should be considered only as the type.'

It must be allowed, that Mr. Sheridan has executed this part of his work in a very masterly manner; having laid open, in the Grammar before us, a plain, comprehensive method of teaching the whole of orthoepy, or the right manner of delivering English by the organs of speech, in as clear and obvious a way, as that

that of orthography, or the proper manner of writing it, wasdisplayed in other grammars. How little qualified the writers of these were for the task our Author has undertaken, appears from what he says of them in his Art of Reading. 'Nothing can be a stronger proof of the gross errors into which literary men have fallen, in their several grammars and treatises on this subject, than that the best of them have mistaken diphthongs for simple sounds, and simple sounds for diphthongs; compound consonants for single, and single for compound: nay, what is still more extraordinary, that they have even mistaken vowels for consonants.'

In this Grammar Mr. Sheridan has pointed out, for the first time, the principles upon which our pronunciation is founded, and the general rules by which it is regulated; though hitherto it has been thought that it was entirely left to chance. But he has clearly shewn, that though, in establishing our pronunciation, there were no certain rules laid down for its regulation, yet there was a fecret influence of analogy constantly operating, which attracted the different words, according to their feveral classes, to itself as their centre. For instance—he has made the discovery, that the pronunciation of our polysyllables is, for the most part, regulated by the terminating syllable, of which he has given examples in the general terminations of our words, with the few exceptions under each article. The critical Reader, ther ore, need not now be at a loss to determine which of the controverted pronunciations of many of our words is most proper; as he can now decide upon the sure ground of principle, not the vague and uncertain rule of authority; and he can assign a reason why he prefers the accenting of the word refractory to that of refractory, concordance to concordance, acad'emy to ac'ademy, and so on through all the words of disputable pronunciation.

Our learned Author hath, in this work, opened a field of fcience which has scarcely been looked into by the moderns, though it was that in which the ancients delighted to range at large, and where they collected the choicest flowers both of rhetoric and poetry, to adorn the temple of the Muses. The pains which they took about the living language were immense, and the labour incessant. They wisely considered speech as the substance, and writing as the shadow, which followed it of course, whilst the moderns have been principally employed in examining the shadow, and thus have never been able to form a sufficiently just idea of the proportion, beauty, and colouring of the substance itself. Had any of the ancient rhetorical grammars been handed down to us, the oratorical art would not so long have lain dormant. But without such assistance no successful attempts could be expected from men, trained up and pre-

judiced

judiced in favour of a language taken in by the eye, when it is considered, that whoever undertook to execute the task should be possessed of a chaste uncorrupt ear, cultivated with the nicest care from early childhood; and that, whilst he was capable of penetrating into the mysteries of a very deep and intricate science, he should be so circumstanced as to have his speculations aided by constant practice, and their truth brought to the test of experiment. Some circumstances in Mr. Sheridan's life seem to have peculiarly qualified him for the present undertaking; and as the subject has employed his thoughts from his early days, his labours have been crowned with success. What he has laid down is so plain as to carry conviction with it. He hath erected, upon the broad basis of science, a comprehensive system of rules, by which the art of elocution may be taught, from the first simple elements, to their most extended combinations.

With regard to the Dictionary, the main intention of it is thus set forth by the Author: 'In his Dictionary he has reduced the pronunciation of each word to a certainty, by fixed and visible marks; the only way by which uniformity of sound could be propagated to any distance. This we find effectually done in the art of music, by notes; for in whatever part of the globe music is so taught, the adep:s in it read it exactly the same way. A similar uniformity of pronunciation, by means of this Grammar and Dictionary, may be spread through all parts of the globe, wherever English shall be taught by their aid.'

Mr. Sheridan was the first among the moderns, who conceived the idea of establishing a certain standard of pronunciation by visible marks. Having thrown out this idea many years since, when he first laid open his plan of his Grammar and Dictionary, the thought was greedily seized on by the late Dr. Kenrick, who resolved to forestal our Author's Work. However, as it fortunately happened that Mr. Sheridan had kept secret his intended manner of marking the founds, Dr. Kenrick was obliged to have recourse to his own invention for this purpose, which availed him so little, that his contrivance is remarkably clumfy and inartificial. To point out the different founds of our vowels, he has had recourte to no less than sixteen marks; which Mr. Sheridan has accomplished by the use of only three. In Dr. Kenrick's way, besides the extreme difficulty of producing a correct edition with such a multiplicity of characters, the time which it would take up, for persons who consult his Dictionary, to become masters of his marks, would be very great; whereas our Author's scheme is the simplest that can be conceived. The whole is done by the use of the three figures, 1, 2, 3; and all that is required of the learner is, to get a small scheme, consisting of seventeen words, by heart, or to hold it in his hand when he consults the Dictionary; and then he cannot possibly mittake the pronunciation of the word according to its marks.

The

The important ends which Mr. Sheridan proposes to answer by the present publication, are pointed out by him in the following queries:

Whe her it would not contribute much to promote the cause of religion, if the service of the church were always performed with

propriety, and sermons delivered with due force?

Whether it would not be of service to the state, if all our senators, who had from nature the abilities, should also be surnished, from art and practice, with the habitual power of delivering their sentiments readily, in a correct, perspicuous, and sorcible manner? And whether this would not be equally useful to the gentlemen of the bar?

Whether it would not contribute much to the ease and pleasure of society, and improvement of politeness, if all gentlemen in public meetings, or private company, should be able to express their thoughts clearly, and with an utterance so regulated, as not to give pain to the understanding, or offence to the ears of their auditors?

Whether it would not greatly contribute to put an end to the odious diffinction kept up between the subjects of the same King, if a way were opened, by which the attainment of the English tongue in its purity, both in point of phraseology and pronunciation, might be rendered easy to all inhabitants of his Majesty's dominions, whether of South or North Britain, of Ireland, or the other British dependencies?

Whether it would not redound much to the honour of this nation, if the attainment of our tongue were rendered easy to foreigners, so as to enable them to read our excellent authors in the original, and converse with the natives of these countries upon equal terms?

Whether many important advantages would not accrue both to the present age, and to posterity, if the English language were ascer-

tained, and reduced to a fixed and permanent standard?

Whether the first step necessary to the accomplishment of these points, be not that of opening a method, whereby all children of these realms, whether male or female, may be instructed from the first rudiments, in a grammatical knowledge of the English tongue, and the art of reading and speaking it with propriety and grace; in the same regular way as other languages, and other arts, of infinitely less consequence to them, are now taught?

'To compass these points, and others perhaps of still greater consequence which may flow from them, has been the chief object of the Author's pursuits in life, and the main end of the present publica-

tion '

The succeeding very curious extract will explain Mr. Sheridan's pretentions to establish a standard of pronunciation.

But it may be asked, what right the Author has to assume to himself the office of a legislator on this occasion, and what his pretentions are to establish an absolute standard in an article, which is far from being in a settled state among any class of people? It is well known, that there is a great diversity of pronunciation of the same words, not only in individuals, but in whole bodies of men. That there are some adopted by the universities; some prevail at the bar, and some in the senate-house. That the propriety of these several

bto-

pronunciations is controverted by the several persons who have adopted them; and what right has this self-appointed judge to determine which is the best?

The Author allows the propriety of the objection, and therefore thinks it necessary to lay open the grounds upon which he puts in his claim to this arduous office.

There was a time, and that at no very distant period, which may be called the Augustan age of England, I mean during the reign of Queen Anne, when English was the language spoken at court; and when the same attention was paid to propriety of pronunciation, as that of French at the Court of Verfailles. This produced a uniformity in that article in all the polite circles; and a gentleman or 1 bly would have been as much ashamed of a wrong pronunciation then, as persons of a liberal education would now be of mis-spelling words. But on the accession of a foreign family to the throne, amid the many blessings conferred by that happy event, the English language suffered much by being banished the court, to make room for the French. From that time the regard formerly paid to pronunciation has been gradually declining; so that now the greatest improprieties in that point are to be found among people of fashion; many pronunciations, which thirty or forty years ago were confined to the vulgar, are gradually gaining ground; and if fomething be not done to stop this growing evil, and fix a general standard at present, the English is likely to become a mere jargon, which every one may pronounce as he pleases. It is to be wished, that such a standard had been established at the period before mentioned, as it is probable, that English was then spoken in its highest state of perfection. Nor is it yet too late to recover it in that very fate. It was my fortune to receive the early part of my education under a matter, who made that a material object of instruction to the youth committed to his care. He was the intimate friend, and chosen companion of Swift; who had passed great part of his life in a familiar intercourse with the most distinguished men of the age, whether for rank or genius. Eminent as he was for the purity and accuracy of his flyle, he was not more attentive to that point in writing, than he was to exactness of pronunciation in speaking. Nor could he bear to hear any mistakes committed by his friends in that respect, without correcting them. I had the happiness to be much with him in the early part of my life, and for several months read to him three or four hours a day, receiving still the benefit of his instruction. I have since had frequent opportunities of being convinced, that a uniformity of pronunciation had prevailed at the court of Queen Anne, by comparing Swift's with that of many distinguished personages who were there initiated into life; among the number of which were the Duke of Dorfet and the Earl of Chestersield. And that very pronunciation is still the customary one among the descendents of all the politer part of the world bred in that reign. Upon investigating the principles on which the pronunciation of that time was formed, I found, that though there were no rules laid down for its regulation, yet there was a fecret influence of analogy constantly operating, which attracted the different words, according to their several classes, to itself as their centre. And where there were any deviations from that analogy, the anomalies were founded upon the best principle by which speech can be regulated, that of preserving the pronunciation which was the most easy to the organs of speech, and consequently most agreeable to the ear. So far the Author has laid open his pretensions, upon a supposition that pronunciation depended only upon custom and fashion. But when he adds, that he is the first who ever laid open the principles upon which our pronunciation is founded, and the rules by which it is regulated, he hopes the claim he has said in to the office he has undertaken, will not be considered as either vain

or prefumptuous."

Undoubtedly there cannot be a better standard of pronunciation, so far as it is regulated by use and custom alone, than that which is afforded by the reign of Queen Anne; though the accentuation of every individual word was not, even in that period, so firmly settled, but that some sew variations may be traced in the very best writers. Mr. Sheridan had certainly a great advantage in being acquainted with such masters of our Spoken language as Dr. Swift, the Earl of Chesterfield, and the Duke of Dorfet; and this advantage hath been prodigiously increased by his own long and ardent attention to the subject, both in a speculative and a practical view, in which respect no perfon living can pretend to compare with him. Nevertheless, our Author must not be surprised, if, in a matter in its nature so delicate and difficult as that concerning which he treats, a doubt should here and there arise, in the minds of the most candid critics, with regard to the propriety of his determinations. For instance, we would wish him to reconsider, whether in the words which begin with super, such as superstition, supercede,

&c. he is right in directing them to be pronounced fho-per. Whatever might be the case in Queen Anne's time, it doth not occur to us that any one, at present, above the lower ranks, speaks these words with the sound, sh; or that a good reason can be given for their being thus sounded. Nay, their being thus spoken is contrary to Mr. Sheridan's own rule; for he says, that the letter S always preserves its own proper sound at the beginning of words. A sew doubts, however, of this kind, will by no means detract from the general merit of the Dictionary before us; which is undoubtedly a work of great authority and importance, and will be sound of the utmoit service to all public speakers; to all foreigners who study our tongue; to all who have been brought up in the use of the Scotch, Irish, or other provincial accents; and to all teachers of the English language.

What is still wanting to complete the undertaking is, that a School of Eloquence be opened, where not only pupils may be regularly taught the art of delivery for their own benefit, but where persons may be instructed in the method of teaching it to

others

others, that thus it may spread through the land. Buch an inflitution would alone be the means of effectually answering the ends proposed by our Author. He had formerly an intention of carrying a plan of this kind into execution; and he is of all men the best fitted for conducting it, by his deep scientific knowledge of the subject, and by his being one of the most correct speakers of the age. Whether Mr. Sheridan still persists in his defign, we are not able to fay; but if he means to pursue it, we fincerely wish that he may succeed in the prosecution of so valuable and desirable an object.

ART. II. Supplement to the Edition of Shakspeare's Plays published in 1778, by Samuel Johnson and George Steevens. Containing additional Observations by several of the former Commentators: to which are subjoined, the genuine Poems of the same Author, and feven Plays that have been ascribed to him. With Notes by the Editor [Mr. Malone] and others. 2 Vols. 8vo. (large) 18s. Boards. Bathurst, &c. 1780.

THIS very curious Supp'ement to Shakspeare well deserves the rank it claims; for though it doth not place itself on an equal footing with the last edition of Johnson and Steevens, yet it merits a place next to it: and the admirers of Shakspeare will esteem themselves indebted to Mr. Malone for the pains he hath taken to gratify their curiofity.

The Editor's Advertisement is sensible and modest. He acknowledges his obligations to feveral learned and ingenious gentlemen, who affilted him with notes and observations to il-Justrate some obscure or interesting passages in Shakspeare. Sir William Blackstone for the first time appears here as a scholiast. His very judicious notes have no other distinction than the final letter of his name, — P. The other gentlemen whose affistance the Editor acknowledges are, Dr. Percy [Dean of Carlifle], the Rev. Dr. Farmer, the Rev. Mr. Henley, Mr. Tyrwhitt, and (above all) Mr. Steevens.

The Advertisement is succeeded by what Mr. Malone calls a Prolegomena, which contains a very curious delineation of the occonomy of our antient theatres, and is a farther proof how laborious and critical his enquiries have been in order to throw

light on this obscure subject.

It may afford some amusement to our Readers, to present them with a general view of the ancient English stage, extracted from the Prolegomena; referring those who wish to be more minutely acquainted with particulars, and the refources from whence they were drawn, to the work itself.

Before Shakspeare, the drama was little cultivated, or understood. Not one play that was published before 1592 will bear a second reading. Exclusive of mysteries, moralities, translations, Acc, there are but thirty-four pieces extant which were published

before that period.

In the time of Shakspeare there were no less than ten play-houses, viz. sour private and six public theatres. Most, is not all Shakspeare's plays were performed either at the Globe on the Bank-side, or at the private theatre in Black Friars. This latter was very small, and plays were represented there by candle-light. The Globe was situated on the South side of the Thames. It was an hexagonal building, partly open to the weather, and partly covered with reeds. It was a public theatre of considerable size; and plays were acted there by day-light. It was burnt down in 1613; and rebuilt the following year with great improvements. Exhibitions at the Globe were chiefly calculated for the lower people: those at Black Friars, for a more select and judicious audience. Wright, author of the Historia Histrio-aica (1699), informs us, that the Globe was a summer, and the other a winter theatre.

In Shakspeare's time, the price of admission to the pit was sixpence:—to the best rooms (as they were called) or boxes, a shilling. Admission to meaner theatres was obtained at a much cheaper rate. The Fortune playhouse, which belonged to William Alleyn, the sounder of Dulwich College, had a Two-penny gallery, as we learn from Middleton's comedy of the Roaring Girl, 1611. In the reign of Charles I. the price of admission to the boxes in the more respectable theatres was advanced to two shillings, and half a crown.

It appears from several passages in old plays, that persons were permitted to fit on the stage as spectators of the exhibition. The critics and wits chiefly took their seats there. This indulgence indeed was granted only at the private, not at the public theatres.—The stage was strewed with rushes; the usual cover-

ing indeed for floors, at that time, in England.

As to the machinery of the stage, it was very simple before the time of Shakspeare, as we learn from a passage in Sir Philip Sydney's Defence of Poetry (1595). Mr. Malone, from several circumstances collected from old plays and their stage-directions, finks the mechanism of the ancient English theatre so very low, as to imagine that it seldom went beyond a painted chair, or a trap-door; and that few, if any of them, had any moveable scenes. They had, he thinks, only curtains to be drawn backward or forward on an iron-rod; and a fingle scene, composed of tapestry, which appears sometimes to have been ornamented with pictures. Some passages in the old dramas incline one to think, that, when tragedies were performed, the stage was hung with black. Mr. Steevens, however, is of opinion that the machinery of the stage in the time of Shakspeare was not so simple and scanty as Mr. Malone supposes. From some stage directions in the

the first follo edition of his plays, it should seem that the machinery was considerably improved. In The Tempest, Ariel is said to enter "like a harpy, claps his wings on the table, and with a quaint device the banquet vanishes." In a subsequent scene of the same play, "Juno descends;" and in Cymbeline, "Jupiter descends likewise in thunder and lightning, sitting upon an eagle." In Macbeth "the cauldron sinks, and the apparitions rise." 'It may be added, says Mr. Steevens, that the dialogue of Shakspeare hath such perpetual reference to objects supposed visible to the audience, that the want of scenery could not have failed to render many of the descriptions uttered by his speakers absurd and laughable.' He also observes, that the pageants and tournaments so often exhibited in the reign of Henry VIII. might afford a natural introduction to scenery on the stage.

Before the exhibition began, three flourishes, or pieces of music, were played; or, in the ancient language, there were three foundings. Music was likewise played between the acts: the instruments chiefly used were trumpets, cornets and hautboys. The band, which did not consist of more than five or fix persons, sat in an upper balcony, over what is now called

the stage-box.

The performers of male characters generally wore periwigs a part of dress unusual at that period. Masques were sometimes worn by those who performed in semale characters. In Shakspeare's time, and for many years afterwards, these latter characters were represented by boys or young men. Sir William Davenant, in imitation of the foreign theatres, first introduced females in the scene.

In Shakspeare's time, it was not customary to exhibit more than a single drama in one day. The Yorksbire Tragedy, or All's One, appears, indeed, to have been one of four pieces that were exhibited the same day; and Fletcher has also a piece called Four Plays in One. We find no other instance of the same kind. Farces were not introduced till after the Restoration.

The entertainment in Shakspeare's time was diversified and enlivened (principally for the sake of the common people) by vaulting, tumbling, slight of hand, morrice-dancing, &c.—in short (says old Stephen Gosson, in his School of Abuse, 1579), as nothing is forgot (viz. by the Devil) that might serve to set out the matter with pomp, or ravish the beholders with variety of pleasure."

The amusements which preceded the commencement of the play were anciently of various kinds. While some part of the audience entertained themselves with reading or playing at cards, others (says Mr. Malone) were employed in less refined occupa-

tions, in drinking ale or smoking tobacco.

It was customary in the time of Shakspeare to carry tablebooks (as they were called) to the theatre, and either from curiofity or enmity to the Author, or some other motive, to write down passages of the play. There is reason to believe, that some of Shakspeare's dramas underwent this sate; and that some of the old quartos were published from these impersest copies.

The ancient custom of concluding the play with a prayer for the health and prosperity of the King and Queen, if it were acted in the public theatres, probably gave birth to the common addition to the modern play-bills, Vivant Rex & Regina. If the play was acted in private houses, the patrons of it were prayed for. Plays in the time of Shakspeare began at one o'clock in the afternoon: and the exhibition was usually finished in two hours. Even in 1667, they commenced at three o'clock.

From Gosson's School of Abuse, above quoted, it seems that dramatic entertainments were usually exhibited on Sundays:—afterwards they were performed on that and other days indiscriminately. Withers complains of this profanation of the Lord's Day, so late as the year 1628, through Prynne is silent about it in his Histoimastix, 1633. May, however, in his History of the Parliament, &c. 1646, taking a review of the conduct of King Charles and his ministers from 1628 to 1640, observes, that plays were usually represented at Court on Sundays during that period. It is probable, that they were not publicly performed at that time on the Lord's Day.

Play-bills announcing the title and leading features of the exhibition were given out in Shakspeare's time to draw an audience: but the characters of the piece and the names of the actors were not specified. This latter practice did not commence till the beginning of the present century. It is conjectured by the Editor, that the long and whimsical titles that are prefixed to the quarto copies of our Author's plays, were transcribed from the play-bills of the time. It is improbable, that Shakspeare, who was exceedingly modest, and who has more than once apologised for his untutored lines, should in his MSS. have entitled any of his dramas most excellent and pleasant performances. The following is an exact copy of the title-page of The merry Wives of Windsor, as it appears in the old 4to edition:

A most
Pleasant and excellent conceited
Comedie
Of
Syr John Fassaffe
And the
Merry Wives of Windsor.
Entermixed

With fundrie variable and pleasing humours of Sir Hugh, the Welch Knight, Justice Shallow, And his wife Cousia, Mr. Slender.

. With

With the Swaggering Vaine of antient Piffoll And Corporal Nym. By William Shakspeare. As it hath been divers Times afted By the Right Honourable my Lord Chamberlaine's Servants: Both before her Majestie and elsewhere. 16C2.

When the æra of benefits for the authors commenced, cannot be exactly ascertained. Mr. Oldys hints at an ancient custom of allotting the profits of the first day to the poet: " a regulation (says Mr. Malone, somewhat archly) which would have been very favourable to some of the ephemeral productions of modern times.' In the latter end of Q. Elizabeth's reign, the poet had his benefit on the second day. Decker speaks of the poet's third day in 1612.

Southerne was the first dramatic Writer who obtained the emoluments arising from two representations; and to Farquhar, in 1700, the benefit of a third was granted. Mr. Addison was the first who discontinued the ancient but humiliating practice of distributing tickets, and soliciting company to attend at the theatre on the poet's night. By this mean practice of foliciting people to attend, Southerne is faid to have gained 700 l. by one play.

The customary price of the copy of a play to the Bookseller in the time of Shakspeare appears to have been twenty nobles, or 61. 13s. 4d. The usual present from the patron to whom

it was dedicated, was forty shillings.

Dramatic poets were, in those times, as at present, admitted

gratis into the theatre.

Cat-calling was an ancient mode of censure. Decker speaks of "mewing at passionate speeches." The common term, as well as practice, of damning plays, is as ancient, at least, as the time of Sir William Davenant, 1643. Three pieces of Ben Johnson's, and two of Beaumont and Fletcher's, underwent this

Actors in Shakspeare's time had not an annual salary. performers shared the profits of the stage, according to a mode of proportion previously agreed on. The utmost that the sharers of the Globe play-house could have received on any one day was about 351. This theatre is supposed to have held about thirteen or fourteen hundred persons. [Each of the modern theatres in Drury-Lane and Covent Garden, Mr. Malone obferves in a note, will contain two thousand three hundred.] In 1685, Shadwell received by his benefit on the third night, 1301. which was the greatest receipt that had been ever taken before that time at Drury-Lane.

It appears from the MSS. of Lord Stanhope, Treasurer of the Chambers to King James I. that the customary sum paid to John Heminge and his company, for the performance of a play at court, was 61. 13 s. 4 d. to which his Majesty would occafionally add, by way of bounty, the sum of 31. 6 s. 8 d.

fionally add, by way of bounty, the sum of 31. 6s. 8d.

Thus scanty and meagre (says our ingenious Editor) were the apparatus and accommodations of our ancient theatres, on which those dramas were first exhibited that have since engaged the attention of so many learned men, and delighted so many

thousand spectators!'

These observations on the ancient state of the English theatre are followed with some account of the original performers in the dramas of Shakeipear:—this account indeed is very slender, but it is the utmost that could be procured; and, though slender, is another proof of the great industry of Mr. Malone. To this is subjoined a transcript of a curious MS lately discovered in the library of Dulwich College, entitled, The Platt of the secound Parte of the Seaven deadlie Sinns. This platt (i. e. plat-form or outline of the performance, enumerating the different characters, with the names of the performers) serves in some measure to mark the various degrees of consequence of several of these old actors. In this platt, Shakspeare, who is simply called Will, is supposed to be the person who acted the part of Itys. also, Edward Alleyne, who afterwards founded Dulwich College, is called Ned; and Henry Condell, whom Shakspeare mentions in his will as one of his fellows, and who joined with Heminge in the folio edition of his plays, is called Harry. Burbage (the alter Roscius of Camden) appears in two characters in this platt. It is difficult to form a just idea of the nature and defign of the piece itself, from this rude sketch of it. It feems to have been an attempt to unite the seriousness and piety of the ancient moralities with the gayer and more infinuating graces of the more regular and improved drama. 'The necesfity (fays Mr. Steevens) of half indulging and half repressing a gross and vicious taste, might have given rife to such pieces of dramatic patch-work as this. Even the most rigid Puritans might have been content to behold exhibitions in which Pagan histories were rendered subservient to Christian purposes. dulness of the intervening homilist would have half absolved the deadly sin of the poet. A sainted audience would have been tempted to think the representation of Othello laudable, provided the piece were at once heightened and moralised by chorusesspoken in the characters of Ireton and Cromwell!' We by no means subscribe to this opinion. The old Puritans objected to every species of dramatic entertainment; and looked on every attempt to unite the church and the stage as an impious profanation of the former. Their rigidness yielded not to the charms

of poetry; and their horror was the more increased when Christianity was blended with the sictions of Paganism, and Religion in her sober suit was forced into company with the

gayer characters of a mixed drama.

The Prolegomena is succeeded by Supplemental Observations on the several plays of Shakspeare, which have occurred since the publication of the last edition. Some of them are of very little consequence, and only serve to enlarge the catalogue of parallel passages, already sufficiently numerous in the preceding volumes. Mr. Tyrwhytt's Remarks on Dr. Warburton's Differtation on Chivalry and Romance are learned and ingenious, and sufficiently consute that great man's hypothesis. But it is too long to be transcribed: and we will not do it the injustice to

abridge it.

The original letter from Warburton to Concanen, which, from a note on Dr. Akenfide's Ode to Mr. Edwards, had long excited the curiofity of the public, is here printed at full length. It was written in the year 1726, and is dated from Newarke; at which place, if we have been rightly informed, Dr. Warburton was at that time a practifing attorney. Matthew Concanen, to whom the letter was sent, was then a member of a club, in which Theobald, and others of the same class. were engaged in a literary war with Pope and his fellow-wits of an opposite fociety. Pope's genius had excited their envy; and the severity of ridicule had mortified their pride. At one of their meetings, the Attorney of Newark had the honour of being introduced by this Concanen. Having been little in the world. he looked on himself as highly distinguished by this introduction; and, in the letter now published, acknowledges the obligation with much thankfulness. The most curious part of the letter is that which relates to Mr. Pope; who is directly charged with plagiarism 'for want of genius:'-the very Mr. Pope, whose genius he afterwards exalted by all the extravagance of praise; and on whose Dunciad, where his old friends, Concanen and Theobald, were hung up to public scorn, he wrote notes to render its satire intelligible, and pointed out beauties to make its merit conspicuous!

The letter contains remarks on Addison's Cato, and on that sublime passage in 'our British Homer' (as he calls Shakspeare)

" Between the acting of a dreadful thing

And the first motion, &c."

It appears from the letter, that he had objections to Shak-fpeare's acquaintance with the ancients—that in his view they were of great weight—that it was necessary that Mr. Theobald should be apprised of them, in order to obviate any difficulty that might occur on that head—and that he would communicate them some other opportunity.

Dr.

Dr. Warburton, indeed, in the Preface to his edition of Shakspeare, acknowledges, that he had formerly the "ill fortune to have some accidental connections with Theobald:"but the merit of this acknowledgment is in some degree rendered questionable by a passage which succeeds it. "He was recommended to me as a poor man." Hence one might be apt to think, that all Dr. Warburton's attention to this poor man was the mere effect of difinterested charity. But whatever his benevolence might have been, at the time when this accidental connection began, we apprehend an attorney of small practice in a country town (as Warburton at that time was) was a very unlikely person for a poor author to be recommended to for patronage and support. In short, Dr. Warburton, when he had tafted some of the sweets of high life, and when the notice taken of him by the greater wits had expanded his ambition, began to grow ashamed of his former connections, and used every art to pailiate and gloss over what it was impossible for him to deny, or disprove. Hence, he calls that accidental which he himself appears to have sought and cultivated: and what he puts down to the score of charity, had been before an object of his ambition!

This curious letter was discovered by chance in the year 1750, by Dr. Gawin Knight, First Librarian to the British Museum, in fitting up a house which he had taken in Crane Court, Fleet street. It was many years in the possession of Dr. Akenside. The note on the Doctor's Odeto Mr. Edwards concludes with this expression, "Of the truth of these affertions (viz. Dr. Warburton's contemptuous treatment of Mr. Pope in his intercourse with Theobald, &c.) his lordship can have no doubt, if he recollects his own correspondence with Concanen; a part of which is still in being, and will probably be remembered as long as any of this prelate's writings."

This valuable Supplement contains a correct edition of Shakspeare's poems, viz Venus and Adonis, The Rape of Lucrece, One hundred and fifty-four Sonnets, The passionate Pilgrim, and The Lover's Complaint. These poems were published separately, with the Author's name, in his lifetime; and were afterwards collected and published in one volume. Shakspeare calls his 'Venus and Adonis,' in the Dedication of this poem to his great patron, the Earl of Southampton, 'the first heir of his invention.' It was entered on the books of the Stationers Company in April 1593. 'The Rape of Lucrece' was first printed in 4to, in 1594: the Sonnets, in 1609; though these last were known in the private circle of his friends so early as the year 1598, having been mentioned in a publication of that year by Meres, in his Wit's Treasury, under the quaint character

eharacter of "Sugred Sonnets of the mellifluous and honey-tongued Shakspeare, in whom lives the sweet witty soul of Ovid." 'The passionate Pilgrim' was first published in 1599, and 'The Lover's Complaint' in 1609. Mr. Malone observes, that 'these poems seem to have gained Shakspeare more reputation than his plays:—at least, they are oftener mentioned or alluded to.'

The authenticity of these poems is too well established by internal evidence, and by the most circumstantial external proofs, to admit of a dispute. Shakspeare's genius indeed was too ardent and vigorous for poems that dwelt chiefly in relation or narrative. Hence, though stored with beauties, they become on the whole languid and tiresome. His end seemed to be, to allot a certain number of verses to each story that he undertook to relate; and when this purpose was accomplished, he did not exert his genius to provide for any thing besides. Permitti numinibus quid conveniat. But it was the faulty taske of the times; for the old poem of Romeus and Juliet (republished in this Supplement) is equally prolix and tedious, and often as uninterest.

ing as the 'Rape of Lucrece.'

The merit of that species of poetry adopted by Shakspeare in his 'Sonnets,' is differently estimated by Mr. Steevens and Mr. Malone; the former calling it 'the contrivance of some literary Procrastes;' and the latter, though not its professed champion, yet is so far interested in its credit, as to think it worth his willie, reflection some little pains in rescuing it from the contempt thrown on it by the former. The Reader, if he will see how the dispute begins, and how it is carried on, must consult the Work itself. It is lest undecided: for though Mr. Malone hath the last word (being the Editor), we have reason to think that Mr. Steevens is disposed to adhere to his own opinion. This is generally the case, after answers, replies, and rejoinders, where the controversy turns on speculation, taste, or sentiment, and cannot be decided by appeals to facts, and is above submitting to any authority.

Before we close this subject, we cannot avoid remarking the striking similarity between one of Shakspeare's sonnets and that well-known and beautiful passage in the Paradise Loss, where Adam is represented as breathing out the enthusiam of his passage.

fion for Eve in the following most elegant lines:

" Sweet is the breath of Morn, her rifing sweet, With charm of earliest birds, &c. &c.

But neither breath of Morn when she ascends
With charm of earliest birds, nor rising Sun
On this delightful land, nor herb, fruit, slowers,
Gliffring with dew, nor fragrance after showers,
Ray. Oct. 1780.

Nor

Nor grateful evening mild; nor filent night With this her folemn bird; nor walk by noon, Nor glitt'ring star-light without thee is sweet."

These lines are a great improvement on the following from Shakspeare (from whom indeed the original thought seems to have been borrowed):

'Yet not the lays of birds, nor the sweet smell
Of different flowers in odour and in hue,
Could make me any summer's story tell,
Or from their proud lap pluck them where they grew:
Nor did I wonder at the lilies white,
Nor praise the deep vermillion in the rose;
They were but sweet, but signres of delight
Drawn after you, the pattern of all those.
Yet seem'd it winter still and you away,
As with your shadow I with these did play.'

Mr. Steevens hath produced a paffage from the beginning of the 3d book of the Paradise Lost, as in some degree similar to these lines; but we do not think the parallel happily chosen; and we are surprised that the passage we have produced did not strike him, as having a much nearer affinity both in sentiment and expression.

Mr. Steevens's quotation is the following:

 but not to me returns

 Day, or the sweet approach of even or morn,
 Or fight of vernal bloom or sammer's rose.

B ... , k

ART. III. Remarks on Dr. Samuel Johnson's Journey to the Hebrides; in which are contained, Observations on the Antiquities, Language, Genius and Manners of the Highlanders of Scotland By the Rev. Donald M Nicol, A. M. Minister of Lismore, Argyleshire. 8vo. 4s. Boards. Cadell. 1780.

In the present performance, our young Author hath attacked a most respectable veteran in literature with much ill-nature, and with a degree of petulance still more intolerable and disgusting than his acrimony. He hath anxiously sought for imperfections in a work where perfection was not attainable. He hath magnified errors and mistakes, which a candid mind would scarcely have perceived; or, if it had perceived, would readily have excused them. But, as it generally happens when prejudice hath vitiated the judgment, Mr. M'Nicol hath not only made the most of venial mistakes, but he pretends to have discovered them where they do not exist. It is therefore not at all to be wondered at, that this work should have swelled to its present fize, or that its Author, proud of holding a competition with Dr. Johnson, without a view of pecuniary advantage, or even literary same (objects above his humility, or beneath his pride!), should

should advance to the charge with all the fancied importance of

a formidable antagonist.

Impartiality, however, obliges us to acknowledge, that Dra Johnson is reprehensible for many passages in his work, which savour more of the illiberal partiality of the intolerant churchman, than the freedom and candour of a wise and unbiassed philosopher. In our Review of the "Journey to the Western Islands," we noted with dislike some ill-natured resections on the ecclesiastical establishment of Scotland: though (as friends to the universal interests of religion) we were pleased to find, that even the Doctor's critical—or, as some would call it—" jaundiced eye" could discover but one striking blemish in the character of its ministers: and that the very blemish which so much offended him lay more in the optic seeing than in the object seen.—They were

Presbyterians!

Nevertheless, we are by no means disposed to join with Mr. M'Nicol in ascribing the errors of Dr Johnson's Work to a spirit of wilful misrepresentation or malignant revenge; nor are we ready to put down the Doctor's aversion to the sacrilegious ravages of Knox's reformation, to his predilection for the superstitions of Popery: neither can we give any credit to Mr. M'Nicol's affertion—that the Doctor visited Scotland with a predetermined resolution to abuse the country, and depreciate Highland traditions, in order to gratify his contempt or his refentment. These are charges of a very serious nature; and we should not be forward to admit them, even if they were supported by more plaufible evidences than this writer hath produced. It is not at all surprising, that a man who hath a favourite system should be peculiarly attentive to those circumstances which tend to confirm it, or that any incidental obfervations should lead more directly to this point; but it is uncandid to ascribe this effect to a settled design, which (as to the main object of it) might have been easily accomplished without the expence and fatigue of a journey through the rueful and howling deferts of Scotland. We may see, from a late publication respecting the character of King Charles I, that such purpofes may be answered with great facility; and that any individual or nation may be covered with a double portion of infamy by a malignant recluse, at a small, a very small expence tither of application or ingenuity.

If Mr. McNicol had not been as strongly biassed by prejudice, as he would represent Dr. Johnson to have been, in almost every reslection which either his wit or his ill nature have thrown on poor Scotland, he would not have been so much enslamed by some very innocent and unimportant observations. He would not have contended with so much sturdiness and zeal for the honour of Scotland in one of the lowest articles of dier.

He would have allowed, that hall might have been unknown in Scotland before the days of Cromwell:—but Dr. Johnson had runfortunately faid, that Cromwell conquered Scotland! This reflection touched the pride of our Scotchman; and he was determined, not only to rob the Usurper of the glory of a conquest, but even to deny him the little praise of adding to the scanty Hock of Caledonian vegetables. He might also have acknowledged (for it is strictly true) that many of the inhabitants, even of the metropolis of Scotland, have not afforded themselves pullies for their fash windows. But, unfortunately again, Dr. Johnson is supposed by his testy Remarker to have taken notice of this defect only for the take of exposing the slovenliness of the Scots. Now as pullies and fash-windows are imagined to be proofs of elegance and convenience, Mr. M'Nicol was refolyed that England should not run away with the honour of their introduction: and with the same laudable zeal for his country, he contends throughy that Scotland was beforehand with England in almost every article, not only of convenience, but of luxury too!

Such trifles as these (and the book before us abounds with them) have made Dr. Johnson's mistakes appear sewer, and of sees consequence than they really are. A more ingenuous antagenist would have had a greater advantage over the Doctor, and, if the honour of Scotland had been the capital object, he would have gained his end more effectually by his candour and moderation. The disposition which Mr. M'Nicol displays in almost every page of his book, reminds us of a scheme of characterising the several nations of Europe in the form of a Newspaper, containing accounts from every capital. The following from Edinburgh is truly expressive of that spirit which distated four-sistes of the Remarks we are now reviewing, viz. "We are informed from the best authority, that Duncan MaGregor, lately executed in the grass-market for house-breaking, was not a Scotchman."

We never considered Dr. Johnson's work as an attempt to give a perfect idea of Scotland: but only to convey the several remarks which were suggested by the objects he surveyed. We were well aware, that from a cynical philosopher we could expect little of that urbanity which is the inseparable companion of an amiable disposition and of polished manners: and from a man who had hitherto been only a speculative Rambler, we could form no great hopes of a work entirely size from missepresentation and partiality. But it is highly petulant and pre-suming to charge him with unjust and ungenerous designs: it is illiberal to reproach him for not taking an account of trees in a country where we are well assured he saw none: and so not describing

describing columns, ruins, and houses, which he had no oppor-

tunity of examining.

This Remarker gives us a very unfavourable idea of his own candour, in the beginning of his book, where he brings a charge against Dr. Johnson for commencing his journey to Scotland on the 18th of August. This the Remarker would represent as a season too late for the valetudinarian to expect any amendment of his health, or the traveller to see objects in the fairest view. Those, however, who are acquainted with Scotland well know, that easterly winds and rain are very common in the earlier part of summer, and that little good weather can be depended on till August. No one who knows the country will join with Mr. McNicol in his criticism, or when they observe that Dr. Johnson hath remarked, that in many places the corn was not carried in even at the late season when he passed through Scotland.

The appearance of the country must be allowed by all impartial travellers to be in general poor, and to indicate the want of cultivation. Inclosures and plantations there are; but they are so rare, as to be scarcely an exception to the universal barrenness of the country, especially the Highlands. The inns, even of the metropolis, are well known to be had; and the accommodations in other places are much more wretched than what we meet with in the common villages in England. These are facts which the partiality of a thorough Scotchman may palliate and gloss over, but he cannot deny—unless he be the very opposite of a flurdy meralist. Instances of particular plenty and hospitality will not

overthrow these general observations.

Dr. Johnson had observed, that the roads in Scotland were little frequented, even near the capital; and his Remarker triumphs in finding, just after, that he arrived at St. Andrews at two in the morning, at which time this captious writer imagines any English roads would have been equally desorted. But he triumphs without a victory; for as the Doctor must have spent nearly the whole day in his journey, he must have been acquainted with the roads near the capital, to which he chiefly

confined his observation.

Mr. M'Nicol is never so happy as when he thinks he hath, caught Dr. Johnson stumbling on a contradiction. He is sure to make the most of it: and on so promising an occasion he makes the most of his wit too. 'In page 3d (says this Remarker) his [Dr. Johnson's] account of the island of Inch Keith is trifling and contradictory. He represents it as a barren rock, where there formerly was a fort; and yet he tells us again, that it never was intended for a place of strength, and that "a herd of cows grazes annually upon it in summer." But a fort without strength is surely something new; and grazing for cartle a most uncommon mark of barrenness.' This remark is equally

S 3.

ill-natured and trifling. There are in Scotland many forts (barring the Latin derivation of the word) without strength; and we have often seen cattle grazing on spots which an Englishman might well call barren; and would wonder how they could be supported there. But we are weary of such quibbling criticisms; and therefore haste to select a sew of his more laboured defences, where the subject is more generally interesting,

Dr. Johnson had dared, in his usual unqualified style, and without asking any Scotchman's permission, to assert [page 57 of the Journey to the Western Isles], that "the Scots must be forever content to owe to the English all their elegance and culture." On an affertion so peremptory, and so mortifying to Scottish pride, Mr. M'Nicol hath thought proper to remark as sollows:

'Had the Doctor been here giving an account of any other nation in Europe, I make no doubt but he would likewise have found some opportunity of making a similar claim in favour of Old England. Our good neighbours have been always pretty remarkable for the modest virtue of self-applause; and considering their own country, at all times, and in all things, as the true standard of persection.

What has been already said concerning our early connection with France, may be a sufficient answer to the absurdity and arrogance of this assertion. It is with an ill grace, indeed, that the English pretend to be a model of taste for others. They themselves are daily copying from the Gallic school: and though they have been long under tutorage, the world have not yet conceived any high opinion of their elegance and culture. In spite of discipline, there is still a roughness in their manners which has rendered them proverbial.

But the frequent repetition of the above remark, to be found in the Doctor's performance, renders it necessary to have recourse to a few facts for setting that matter in a proper light; and therefore must recal his attention to some circumstances relating to the state of the two kingdoms long before any friendly intercourse between them could give us an opportunity of receiving those boasted improvements.

In the year 1234, straw was used for the King's bed in England. In 1300, wine was sold in England only by apothecaries as a cordial. But it was then quite otherwise in Scotland, because of our extensive trade, in proportion to the commerce of those days, with France and Spain: and till I adverted to this circumstance, it often surprised me to find frequent mention made, in many of our ancient Galic poems, of the drinking of wine and burning of wax in the habitations of our chiestains. In 1340, the parliamentary grants to the King of England were only in kind; and 30,000 sacks of wool was this year's grant. In 1505, the first shilling was coined in England. In 1501, Queen Elizabeth wore the first pair of knitted filk stockings that ever were in that country. In 1543, pins were first made in England, and before that time the ladies wore skewers.

To all this let me oppose, but particularly to the feewers of the English ladies, the account which the Bishop of Rosa gives of the dress of the women amongst the ancient Scots. We shall find, that it they

\*\* they were clothed with purple and embroidery of most exquisite work\*\* manship with bracelets and necklaces on their arms and necks, so
\*\* as to make a most graceful appearance." Nor needs it be a matter of surprise, how the Scots had opportunities of procuring such ornaments, since the same Author shews they had, at that time, a confiderable trade with France and Spain from Inverlochay, near Fort William.

But notwithstanding all that can be said to the contrary, the Doctor seems determined, right or wrong, to maintain his position. He therefore goes on, and tells us again, very roundly, that "till the Union made the Scots acquainted with English manners, their tables were coerse as the seasts of Fskimaux, and their houses silthy at the cottages of Hottentots."—There is an expression among the lawyers, that what proves too much, proves nothing. It is just so with my woorthy friend the Doctor in this place: he nath laid on his filth so very thick, that I am of opinion it will fall off by its own

weight.

But, in the name of wonder, who could have expected such a remark to drop from the pen of a man on whom the witty Lord Chesterfield, many years ago, bestowed the appellation of Hottentot? His Lordship was allowed not only to be a good judge of character, but likewise to have had a good hand at drawing a likewest. It was therefore unlucky in our Author to come blundering out with an expression which must call to our remembrance this striking specimen of the noble artists skill. But I will be bold to affirm, that no man has ever yet seen Dr. Johnson in the act of seeding, or beheld the inside of his cell in Fleet-street, but would think the feasts of Estimaux, or the cetages of Hottenests, injured by a comparison.

Mr. M'Nicol may, if he pleases, consider this as an excellent froke of wit and raillery, and enjoy it in the full measure of self-complacency. We envy him not his entertainment, nor

are we disposed to share with him in the pleasure of it.

But Mr. M'Nicol's humour is only a transient and sudden flash. It is soon lost in the more terrible flame of his indignation. The broad sword shoots a gleam of horror athwart the gloomy waste, and all the axes of Lochaber rush on our fight.

Mercy on us!

If this folema pedant (fays Mr. M'Nicol) will deign to look back, he will find many things in the history of his own country which ought to convince him, that civilization did not begin very early there, nor advance with a very quick pace. I am always forry when I am obliged to trace out anecdotes of this kind; but his ill manners and want of candour render it necessary.

O! what hath Dr. Johnson to answer for! If it had not been for his ill manners, the ignorance and barbarity of our country would not have been exposed; nor would modesty itself have been so cruelly put to the blush, as it was, when the delicate hand of Mr. M'Nicol was compelled to the task of uncovering the nakedness of the land!

Alfred the Great, who died in the year 900, complained, that from the Humber to the Thames there was not a priest that undersshood the Liturgy in his mother-tongue: and that from the Thames to the sea, there was not one that could translate the easiest piece of Latin.—In 1167, King Henry II. sends to Ireland, and causes a palace of wattles to be built in Dublin, after the manner of the country, wherein he keeps his Christmas. It was not till 1200 that London began to be governed by a mayor: and so near our own times as the year 1246, most of the houses in that capital were thatched with from:—the windows were without glass:—and all the fires stood to she wall without chimnies. In the year 1300, and afterwards, almost all the houses in England were built of wood.—

As our traveller gives us only his own authority, for what he fays of Scotland at the time of the Union, a testimony which the Reader by this time cannot think altogether unexceptionable; let us now see what others have reported of the state of civilization among us long.

before that period.

When Margaret, daughter of Henry VII. of England, became the Queen of our James IV. the was attended to the Scotch court by, many of the first nobility of both sexes: and yet the English historians of those days allow, that they were fully equalled, or even excelled, by the Scotch nobility in politeness of manners, the number of their jewels, and the richness of their dress; and particularly, that the engertainments they received at the houses of our great people did not

yield to any thing they had ever feen.

In 1546, Contarisi was Pope's Legate in Scotland; and upon his return to the continent, he celebrated the Scotch nation as a politic and bespitable people. He bore this testimony to their merit, though he could not succeed in the object of his embassy; which was to support the Romish religion, then sast declining in that kingdom, on account of the intolerable cruelties of Cardinal Betoun. But this present, very unlike to Dr. Johnson, could not permit his prejudices as an ambassador to warp his veracity as a man.

The Queen of James V, though a prince of o civilized a nation as France, acknowledged, that "the court and the inhabitants of Scotland were the most polite and civilized she had ever seen, and

the palace of Linlithgow the most magnificent.'

After these remarks on Scottish politeness, Mr. M'Nicol, by a long and indeed curious quotation from Lindsay's History of Scotland, attempts to establish his country's claim to profuseness in the article of good cheer, and produceth as a specimen of uncommon luxuriance, 'the Earl of Athol's seast to James V.—But for this we must refer to the book.

The coup de grace to the authenticity of the Poems of Offian has, in the opinion of many, been effectually given by Dr. Johnson, who hath afferted without reserve, that there exists not an Erse manuscript of a hundred years date. Mr. McNicol contests this affertion with much spirit, and in our opinion thoroughly disproves it. He observes, That not only poems of considerable length, but likewise genealogies of families, and treatises

tifes on different subjects, have been anciently written in the Gaelic. and that this hath been proved by a variety of instances. Let me now produce an additional testimony from Mr. Innes. In page 603 of his, loquiry, he mentions a chronicle of a few of our Kings, from Kennub Macabine to Kenneth III. fon to Malcolm I. and he says, that the original chronicle or history, from which that piece was extracted, fooms evidently to have been written in the Geelic language, and that, some time too besore the year 1291. He hath preserved in his Appendix the Latin chronicle, which is a sopy of the original. Among the old MSS. of confiderable length, I took notice particularly of two. One gives the history of Smerlie Mora, one of the anceffors of the Duke of Argyle, who lived in the 5th century, according to a manuscript genealogy of that illustrious family; and the other contains the history of the foas of Ujnoth. They are both in the Gaelic language and character, and are to very old as to be difficult to be read. They are in the possession of Mr. Macintyse of. Glencoe, near Bunaw, in Argyleshire.

But as the Doctor may think it too great a trouble to travel again to the Highlands for a fight of old manuscripts. I shall put him in the way of being satisfied nearer home. If he will call some morning on John Mackenzie, Esq; of the Temple, Secretary to the Highlands. Society at the Shakspeare, Covent-Garden, he will find in London, more volumes in the Gerlic language and character than perhaps he will be pleased to look at, after what he hath said. They are written on vellum, in a very elegant manner, and they all hear vary high marks of antiquity. None of them are of so modern an origin as that mentioned by the Doctor. Some of them have been written above 500 years ago; and others are so very old, that their dates can

only be guessed at from the subjects of which they treat.

Among these are two volumes which are very acmankable. The one is a large folio MS. called An Duanaireadh Ruadh, or the Rad Rhamer, which was given by Mr. M'Donald of Glancalladel, in Muideart, to Nr. M Donald of Kyles, in Caudeart, who gave it to Mr. Macpherson. It contains a variety of subjects, such as some of Office's Pooms, Highland Tales, &c. — The other is called An Leabhar Dearg, or the Red Book, which was given to Mr. Macphorson by the hard Macquerich. This was recknowed one of the most variable manuscripts in the bard's possession.

Since I began these Remarks, I have been informed by Mr. Macdonald, the publisher of the Gaelic poetry, that his uncle, Mr. Lauchlan Mecdonald of Somb Uist, was well acquainted with the last of these manuscripts; and as that gentleman is a great master of the Gaelic language and character, his opinion concerning its antiquity, from the character and other circumstances, is the more to be relied on.

To anish this head, at present, let me next inform the Dollors, that the hard Macounich alone is in possission of a geomet number of Gaelic manuscripts than the Dostor perhaps would chuse to read in any language. At the carnel and sepanted request of Mr. Macdonald, the publisher just mentioned, the band hath been at last prevailed on to open his repositories, and to permit a part of them to be carried to Edinburgh for the satisfaction of the curious.—I myself have seen more than a stongard pages of what has been thus obtained.

es have hundreds befides: and Mr. Macdonald affures me, that what he has got leave to carry away bears but a very small proportion to

what still remains with the bard.

ir It feems almost unnecessary to mention, that all those manuscripts are in the Gaelic language and character. Some of them have suffered greatly by bad keeping; but many more by the ravages of time. The character of several is allowed by all who have seen the manuscripts, to be the most beautiful they had ever beheld.

Of the bard Macvurich, above mentioned, our Author gives

us a curious account; for which we refer to the book.

Dr. Johnson having with great plausibility attempted to overthrow the authenticity of Offian's Poems, by remarking, that it was next to impossible for any persons to have committed them to memory, confidering the great length of some of them, Mr. M'Nicol combats the force of this objection with much dexterity and acuteness, by observing, that 'though nothing had ever been written in the Gaelic, yet the manners and customs of the Highlanders were peculiarly adapted for preserving the various productions in their language. The constant practice of recitation, which is not yet difused, gave them " opportunities of hearing a long compofition often enough to learn it;" and their defire to amuse themselves in the folitudes of hunting, or a pasteral life, as well as to bear their part in focial entertainments, gave them "inclination to repeat it as often as was necessary to retain it."-By these means, there was no great danger of any thing being fo far forgotten as to be " loft forever;" for if any one person should sorget a particular part, there were always thousands who remembered the whole, . . . . Our tales, which are for the most part of considerable length, bear a great resemblance to the Arabian Night: Entertainment. One of those in parsicular is long enough to furnish subject of amusement for several mights running. It is called Scialachd Choise Co, or Cian O Cathan's Tale: and though Schialachies, or tellers of tales by profession, are not now retained by our great families as formerly, there are many fill living who can repeat it from beginning to end, very accurately.

This cannot appear improbable to those who confider how much the memory is strengthened and improved by frequent use. When duly and constantly exercised, it is capable of surprising exertions: and we have sometimes read of instances which amount even to pro-

digies.

I myfelf once knew a man, who, I am certain, could repeat no less than 15,000 lines: and there is now living one Post Macintyrs, who can repeat several thousands. This man is altogether illiterate, though not a despicable poet. Besides remembering many of the compositions of others, and likewise of his own, not yet published, he lately dictated from memory as many songs, composed by himself, as fill a volume of 162 pages, and amount to upwards of 4000 lines.'

From a paper, figned W. Cambrensis, and published in the St. James's Chronice of the 23d of March 1775, Mr. M'Nicol extracts the following quotation, as a farther support of the above remarks on the power of memory. "I can with truth aver (says the Author of that paper in the Chronicle), and what

many

many will affirm, that there are several persons in Wales who can repeat the transactions (however fabulous) of Arthur and his mil-yeur, i. e. his thousand heroes, which are as long as the Poems of Offian." This writer remarks, that the poems of Taliessen, who flourished in the year 500, the chief of the Welch bards, were handed down by tradition like the Poems of Offian.

To give still further credit to this traditionary delivery of poems from one age to another, Mr. McNicol observes, that the practice of committing much to memory feems to be very old, and probably was borrowed from the Druids, who, as we are affured by authors of credit, were obliged to get 20,000 lines by heart, before they were judged fit to exercise their office; for it was an established maxim among them, never to commit any of their religious tenets to writing.

On the whole, we have in this performance of Mr. M'Nicol's but little real information respecting the state of Scotland. The most curious part is that which relates to the bards, and of which we have already taken due notice. The Remarker, anxious to confute Dr. Johnson, has, to our knowledge, in many places, coloured the picture so highly as to obscure the resemblance; and though he sometimes convicts Dr. Johnson of partiality, yet he more frequently discovers his own.

ART. IV. Memoirs of the Rev. Ijaac Watts, D. D. By Thomas Gibbons, D. D. 8vo. 6 s. Buckland. 1780.

Late \* publication, entitled, The Posthumous Works of Dr. Jee Vol. Watts, hath already afforded us an opportunity of paying 65, 237. our respects to the memory of that amiable and ingenious divine. In doing this, we endeavoured to keep to the exact line of truth, unbiassed by prejudice or partiality:-our esteem for the virtues of this excellent man did not precipitate us into a blind admiration of his genius; nor, on the other hand, were we tempted to degrade his abilities, because the enthusiasm of his heart, operating on a fanatical creed, hurried him too often into extravagance and absurdity. While we owe candour to individuals, we are not to forget what we owe to the public. The present attempt, however laudable in its design, is not unexceptionable in respect of its execution; for in the violent stretch of applause, we almost forget the virtues and excellencies of Dr. Watts, which are lost in the disgust excited by the vanity and affected importance of Dr. Gibbons; who seems to entertain an idea of going down to posterity, arm in arm with the respectable

<sup>\*</sup> Vid, December 1779, Review .- N. B. The Editor of these Memoirs disputes the authenticity of a considerable part of the above publication. •bje&

object of his encomiums. We see him, with Fancy's flattering glass in his hand, throwing himels into futurity! We see him' contemplating his own admired image with solemn transport, and (like the bards of ancient time, when filled with the fury of the Muse) yielding to the premonition from above; till, swelling beyond the boundaries of the present, he bursts into the suture, and antedates the applause of distant ages!

Dr. Gibbons informs us, that he received the materials for the composition of these Memoirs from Dr. Watts himself, and his brother, Mr. Enoch Watts,—from various intelligence obtained of others, and from his own intimate acquaintance with the

Doctor for several years before his death.

The first chapter gives an account of the birth, childhood, and classical education of Dr. Watts. It records some little anecdotes (already noticed in our Review for December last) of the Doctor's premature genius, and of the rapid progress he made in his studies under a Mr. Pinhorne, master of a free-school at Southampton. The present Biographer informs us (by way of addition to some strange stories related in the former account), that 'before he could speak plain, when he had any money given him, he would say to his mother, "A book! a book! buy a book!"—that surthermore, at the age of seven, he wrote an epigation on a farthing; and at eight, had so far improved his talent, as to produce an acrostic upon his own name! One of the Doctor's juvenile essays is here republished from the Lyria Poems. It is a Pindaric ode, in Latin, addressed to his classical preceptor. Dr. Gibbons, smit with a desire of 'gratifying the church, and contributing to the general good,' hath translated this ode into English verse, and leaves us to wonder

With what a wing!—to what a height He tow'rs, and mocks the gazing fight, Lost in the tracts of day!

Dr. Gibbons, having foared with Dr. Watts on 'peerless pinions,' descends (though not without cutting a figure in the way) to humble prose: and, 'as an improvement of the first chapter, he entreats all persons who intend a learned prosession, and especially that of divinity, to make themselves well acquainted with the Latin and Greek languages.'—'Perhaps, continues he, this will contribute not a little to insuse dignity and elegance into our compositions. Had not Dr. Watts been the good classical scholar he was, he might never have shone with such a pre-eminent lustre as a poet and fine writer. By his early proficiency in the Latin and Greek, he was not only prepared for academical exercises and studies, but whenever he wished to banquat on a Latin and Greek writer, the 'rinds in which their rich ideas were inclosed immediately opened their internal treatures to him.' Now this is verily a peerless metaphor!—Nevertureless.

theless, we heartily join with Dr. G. in recommending a classical education for gentlemen of all professions, and particularly for divines; reflecting, at the same time, that amidst the advantages which will accrue from it, the least would not be a correct and refined taste in composition, equally distant from dulness or want of ornament, and a profusion of glaring and far-fetched

metaphors.

The fecond chapter gives an account of the Doctor's acade mical studies under Mr. Rowe of London. The mention of this gentleman's name affords Dr. Gibbons a precious opportunity of saying something on the darling subject of himself. He exults in the honour he enjoys of having been, for the space of 36 years, the pastor of a Diffenting congregation, meeting at Haberdasser-Hall—the very same meeting-house in which this very Mr. Rowe formerly preached, and where Dr. Watts himfelf was first admitted to communion! This chapter confilts of fome theological theses in English and Latin, extracted from a manuscript in the hand-writing of Dr. Watts, given to the

Editor by Mr. Enoch Watts.

The third chapter contains ' some occasional poems of Dt. Watts during his studies, or very foon after closing them." These poems are in Latin, accompanied with English versions by the Editor; most of which, if we mistake not, appeared a few years fince in a publication of Dr. G.'s under the title of The Christian Minister, addressed to a certain reverend J. Watfon of Gosport. This chapter is closed by a brief account of three ingenious gentlemen of the Doctor's earliest acquaintance, and who had been fellow-students with him at Mr. Rowe's academy; viz. Mr. Josiah Hort, afterwards Archbishop of Tuam, in Ireland; Mr. John Hughes, author of the Siege of Damascus, and other poetical pieces which have been well received; and Mr. Samuel Say, a Differting minister of Westminster, whose Poems, &c. &c. were published after his decease by the late Mr. W. Duncombe.

The fourth chapter contains a 'review of Dr. Watts's life." in which there is an account of his ordination among the Independents—his pastoral connection—his domestic and private engagements-his frequent and severe indispositions- how comfortably (as Dr. G. says) he felt himself under the pressure of sickness on his body'-the verses which he composed on the occasion, and the pious improvement which he made of the various events of Providence. It also contains some slight accounts of the families of Sir John Hartop and Sir Thomas Abney, in which the Doctor spent the greatest part of his life; and moreover, to these accounts is auded, 'An Ode to the memory of that amiable mirror of Christian grace and virtue, Dame Mary Abney, by—Dr. Thomas Gibbons!'

Abney's high character in verse. And sheds his undiminish'd rays O'er all the tener of her days.'

The fifth chapter is an attempt to delineate Dr. Watts's character as a Christian and a minister.' In this delineation his panegyrist represents him as 'the most universal scholar of his age," as well as ' possessed of extraordinary abilities as a poet:" and also of so 'large a portion of wit,' that perhaps, says Dr. G. few persons possessed so much, though he never seemed fond of displaying it.' Considering him in the capacity of a poet, his biographer thinks he pays him the highest compliment by observing, that 'his Muse was generally employed upon divine themes, and was very rarely permitted to depart from the fanctuary of the Lord.' He produces one exception, indeed, to the fantluary-ship of the Doctor's Muse, viz. The Ode to Lady Sunderland. 'This, says the Editor, cannot be called a religious ede, or be faid to contain any precept of virtue.' Let this however be as the Editor fays, yet we think he might have spared himself the trouble of publishing the Doctor's apology. The verses needed none \*. But Dr. Gibbons was sufficiently aware for whose edification these Memoirs were written; and while, from a sympathetic concern for poor tender fouls, he was engaged in the above-mentioned humble apology, we are fomewhat surprised at his omitting to apologize for The few happy Matches. This little fong is not less elegant and sprightly than the Ode to Lady S. and equally destitute of the savour of the fanctuary.

In drawing the picture of Dr. Watts's mind, Dr. Gibbons lays on colour upon colour, with such a matchless prodigality, that the eye, of a fober spectator at least, instead of being pleased and enlivened by simple nature, is dazzled and fatigued by a glare of confused and pompous images, that present no distinct object, and, consequently, leave no steady impression. 'His foul, fays Dr. G. appeared to have no plaits or foldings in it, but expanded itself into an open, broad view at once i or, to adopt another metaphor, his mind was a clear, transparent stream, whose inmost depth was obvious to all, and in which lay, not weeds and dirt, but treasures richer than those of Pactolus, whose waters glided over beds of gold.' And all this glorious waste of words is meant to convey a more than ordinarily perspicuous idea of fimplicity! Surely that plain and modest virtue is difguifed in this mockery of drefs! It is encumbered with this load of useless ornament! It is---- How contagious are bad ex-

This ode is printed in our Article referred to in the preceding Mote.

amples! We had started a Metapher, and like Dr. G. we should have run it down, if we had not luckily recollected that we must

keep our breath for choicer game.

This Memoir-writer, in the farther delineation of Dr. Watts's character, observes, in his usual phraseology, that he appeared to be nobly avaricious of his time, and ever watchful to improve it, fuffering none of its fands to run down in vain.' . . . When he went abroad among the scenes of rural verdure, beauty, and fruitfulness, like the bee in its industrious ranges for celestial sweets, he was solicitous to gain fresh food for heavenly contemplation, or fresh materials and ornaments for future compofitions. The pastures covered with flocks and herds, the fields waving with the ripening harvests, the groves resounding with the melody of birds, enlivened his praises; and he saw, heard, and confessed his God in all. The skies by day struck his soul with admiration of the immense power, wisdom, and goodness of their Divine Author: the moon and starry train by night increased his conceptions of Deity; and in the open manuscript of God, the wide-extended heavens, he read the letters of his great and wonderful name with profound homage and veneration. All that met his eye and ear, was laid, as it were, under a perpetual tribute to yield him improvement, and confecrate and enrich his moments of leifure, and neeessary cessation from his Audies: and, in short, nature was only a scale to his devout foul, by which to ascend to the knowlege and adoration of God.'

This piece of half-poetry and half-profe, seems rather to be introduced for the purpose of displaying the descriptive talents of Dr. Gibbons, than the devotional temper of Dr. Watts. the latter had been the chief object, as it ought to have been. its end would have been more effectually answered by five words than by all this formal and oftentatious parade of mock eloquence, about rural verdure, waving fields, and ripening harvests; resounding groves, and the melody of birds: the starry train, the manuscript of heaven, and the scale to ascend to it. But some writers think they can never fay enough: and they are so vain of every thought, especially if it should chance to come in the shape of a metaphor, that they have not the heart to suppress any. Now if such writers could fairly and honestly put themselves in the place of their readers, and exchange seelings with them, they would learn to be more frugal, and not bellow fo bountifully what is generally received fo unthankfully.

Dr. Gibbons, after passing a most extravagant encomium on Dr. Watts's talent for conversation, informs us, that he hath been at some pains to collect proofs of his excellence in this respect; the much greater part of which, says he, are taken from the register of my own memory. The much greater part

....

inight have continued there, for they afford no evidence of what they are brought to prove. One observation, which the Editor of these Memoirs hath produced from his register, may indeed go very far, with a certain class of saints, to prove the Doctor's piety: but we are persuaded that it will rested no honour on his taste or understanding, in the judgment of men of sense. It is this —" I had rather, said Dr. Watts, be the author of Mr. Bakter's Gall, &cc. than the author of Milton's Paradise Lost." Some will think that this was spoken (if spoken at all) rather

from envy than from conviction.

The Editor hath also been careful to pick up fome occasional speeches which Dr. Watts gathered from others.' "Young man, faid Sir Edmund King to him in early life, I hear that you make verses. Let me advise you never to do it but when you can't help it." Now, in our opinion, there is nothing in this piece of advice, which Dr. Gibbons hath thought worthy of recording. It is equivocal: and a vain feribbler, finit with the leve of posty and prate, would ever avail himself of the liwence of the latter part of the admonition, to turn a deaf ear to the caution of the former. Why did Dr. Gibbons write his Juvenilia, and permit this reproach of his youth fill to stand forward in the front of his poetic follies? He could not help it! Why did he write Three Epifles to Philander on the duty of a minister, and call that poetry which is barely profe? He could not help it! Why did Dr. Gibbons, stung with the lust of metaphor, compare this Philand.r's head to a hive, and the thoughts of that head, when laid on its pillow, after a hard day's fludy, to a swarm of bees, humming around it? Alas! he could not help it! We suppose Dr. Gibbons's old friend, Sir Richard Blackmore, and the other worthy gentlemen of the Dimeial (of equal fame and congenial spirit with himself), were all dispessed to take fanctuary in this plea. But though, to ease themselves of poetic throes, it be necessary that their teeming Muse should drop her burden in writing, yet where is the necessity that it should be exposed in print to the public eye?

The fixth chapter is an attempt to illustrate the merits of Dr. Watts's writings in profe; the seventh, his writings in verse; and the eighth, his improvements on the writings of others. These chapters are also designed to exhibit striking evidences of Dr. Gibbons's critical sagacity! The various sigures of rhetoric, Apostrophes, Periphrases, Climanes, Polysyndetons and Personistations, are here most pompously displayed, first by Br. Gibbons's definitions, and secondly by Dr. Watts's examples: But our Author, instead of proving himself the manly and judicious critic, is only the fond admirer. One specimen is sufficient: 'Is a Periphrasis, when made use of to keep from immediate view what would give pain or disgust in an open sepresentation, a

beautiful

beautiful figure of speech? May we not observe a very pleasing example of this kind in the following stanza, in which neither death, nor any of his glooms or distresses are so much as mentioned, but it is only said,

' How should we scorn these clothes of stess,
These setters and this load;
And long for evining to undress,
That we may rest with God!'

The ninth chapter relates to Dr. Watts's friendly connections, and 'the honourable notice taken of him when living.' The tenth contains an account of 'his decline and death.' The twelfth confifts of 'felest letters of his correspondents.' Many of these letters are egregiously trisling, and ridiculous. We apprehend the Editor will receive no thanks from several Hustrious samilies, for publishing some letters which bear the

fignature of great and diffinguished names.

The first letter in this collection was written as early as the year 1711, by Dr. Thomas Secker, the late Archbishop of Canterbury: it is curious, as it contains some account of the regulations and studies of the Disserting Academy established by the learned Mr. Samuel Jones at Tewksbury in Gloucestershire; where that excellent and venerable prelate received some part of his education, together with that most illustrious ornament of the church, Dr. Butler, the late Bishop of Durham; and Dr. S. Chandler, whom the Disserters may justly boast of, as second, in learning, to none.

Dr. Watts's abilities, and most amiable character, procured him the esteem and friendship of some great divines of the established church. He was indeed an excellent man, a most valuable minister, and a very useful writer. We truly revere his memory, and honour his name, and think it merited a tribute far better than these 'Memoirs,' in which the Author so often steps aside to sacrifice (as the Scripture tays) to his own Net, and to burn incense to his own DRAG!

ART. V. THELYPHTHORA; or, a Treatise on Female Ruin, in its Causes, Esseds, Consequences, Prevention, and Remedy; considered on the Basis of the Divine Law, under the following Heads, viz. Marriage, Whoredom and Fornication, Adultery, Polygamy, Divorce; with many other incidental Matters; particularly including an Examination of the Principles and Tendency of Stat. 26 Geo. II. c. 33, commonly called The Marriage AA. 2 Vols. 8vo. 10 s. in Boards. Dodsley. 1780.

S a defence of the Bible hath often been professed, when nothing less than its overthrow hath been intended, we were at first led to suspect, that an attempt to justify the DIVINE RITE of Polygamy had been some new manaeuvre of infidelity Rev. Oct. 1780.

to expose the authority with which it would lodge the appeal. We have not forgotten the covert attacks of Tindal and Toland; and above all, we have cause to remember the disguised effort of the insidious Dodwel; to say nothing of the tricks of some later apostates—new-minted in Morgan's mould! One chief part of their skill and advoitness was to give the colour of sincerity to the forms of prosession; and, by speaking peace with their lips, disguise the mischief that lurked in their hearts.

We would not be so uncharitable as to impute to the Author of this treatise any base and treacherous intention to overthrow the credit of Scripture: nor would we indulge a suspicion that would bring the chastity of his morals in question. He seems to be much in earnest! and were he an Author of any weight or consequence in the church, the insidel might think he had a precious opportunity afforded him to vilify the Bible under the fanction of his name; and the libertine might dexterously avail himself of the authority of the Rev. Mr. Madan, to give the colour of religion to his love of variety; and quote the Scriptures to sanctify lewdness.

The Author indeed appears to be conscious how much his fystem is liable to abuse. But he recurs to the common subtersuge, of which every setter up of strange gods, and every conscientious troubler of the public peace, have artfully availed themselves, to silence the clamour of expostulation. "Truth!"
Truth!" is their general cry: and with this hopeful pretence, prudence and humility, and every amiable and useful virtue, are left behind, while conscience (conscience!) blindly rushes forward to oppose order, insult authority, and overturn the customs of ages.

It is written (lays this Author) concerning the Scriptures themselves, that to some they are a savour of life unto tife, and unto others a savour of death unto death; and that the unlearned and unstable wrested the Epistles of St. Paul, and also the other Scriptures, to their own destruction. As therefore there is nothing in this book which is not to be found in these Scriptures, as to the points hinted at (viz. on marriage, polygamy, &c.), the Author ventures it forth, considing in the promise of him who hath said, As the rain cometh down, &c. Vid. Is. Iv. 10, 11.

On the footing of this most consident presumption, the Rev. Author thinks himself at full liberty to discard 'the writings of the primitive fathers, the whole rabble of schoolmen, together with the decrees of councils, churches, and synods;' and to establish, what he thinks, the pure law of God, without any dread of the consequences that may arise from the misconception or perversion of any part of it.

The Preface to this Work contains some specious pleas for the freedom of inquiry, and the obligation incumbent on every Christian,

R

Christian, to speak what he thinks to be the truth, however inconsistent it may be with generally received opinions, or established forms of practice. But is it not the business of a good Christian, and a good citizen, to consult discretion and public utility, in the use he makes of his liberty? What may be lawful may not be expedient: and notwithstanding all the splendid apologies that have been made for free-thinking by its zealous partisans, perhaps a little regard is still due to the opinion of the venerable and pious Bishop Hall, that "some quiet errors are better than some unruly truths."

The first chapter treats 'of marriage as a divine institution.'
—From the original command given to our first parents, our Author infers, that marriage simply and wholly consists in the ast of personal union [Astus coitús]. This position he attempts to support by many ingenious and plausible arguments, sounded on the declarations of Scripture, and illustrated by the practice of ancient Rome, Scotland, and Holland, by the laws respecting post-legitimation, as well as by the proceedings of our ecclesiastical courts, and the decisions of our ablest canonists.

The second chapter treats of the sin and danger of 'whore-dom and fornication;' or the promiscuous intercourse of single persons, who, for sensual gratification, or for the sake of gain, consent to a temporary union, and dissolve it at pleasure. In this view he reproduces the practice of keeping mistresses; and treats of the difference between them and the concubines which the Jews were allowed to keep. The latter were a lower class of wives; and a connection with them was deemed both sacred and indissoluble: whereas the former consider themselves as bound by no law, either of God or man, to preserve their union with their keepers any longer than it may suit their interest, of their inclination.

The third chapter treats of the nature of 'adultery;' its heinousness in a moral and religious, and its pernicious tendency in a civil and domestic view.

writings but to denote the defilement of a betrothed or married woman; except in a figurative sense with respect to idolatry, where the same idea is exactly preserved. The Author laments, that the ancient law of God, which made this crime capital, should be superseded in Christian countries. An action, by the law of England, may be brought against the delinquent for private damages: but it inslicts no punishment on him as a public offender by any one statute throughout our whole code of laws. How sar (says our Author) this is seen to be for the comfort of society, and the honour of a Christian nation, let others determine. I can only say, that if the law of God (which by the way is as clear and positive a law as can be conceived) took.

T 2

place, we should hardly hear of such daily offences against it as

now disgrace, dishonour, and defile the land.'

The Author restrains adultery to the defilement of a betrothed or married woman. A married man, in his idea, is no adulterer, if his commerce with the fex be confined to fingle women, who are under no obligations by espousal or marriage to other men. It was necessary to establish this position for the sake of vindicating the honour and purity of polygamous contracts. If a married man was bound to one woman, by the same ties by which a woman is bound to her husband, the consequence would be, that the polygamist must be an adulterer. Mr. Madan argues this point with much shrewdness and ingenuity in his fourth chapter, which treats largely of polygamy—the Author's savourite subject, and for the vindication and cstablishment of which the whole treatise appears to have been chiefly written.

The Writer limits the privilege of polygamy to the man; and shews the hideous consequences that would result from an extension of it to the woman. He enlarges on the polygamous connections of the patriarchs and saints of the Old Testament—and infers the lawfulness of their practice from the blessings which attended it, and the laws which were instituted to regulate and superintend it.

He contends for the lawfulness of a Christian's having, like the ancient Jews, more wives than one; and labours much to reconcile the genius of the evangelical dispensation to an arrangement of this sort. He afferts, that there is not one text in the New Testament that even hints at the criminality of a polygamous connection; and would inser from St. Paul's direction, that Bishops and Deacens should have but one wise, that it was lawful for laymen to have more. This concession is doubtless very liberal and disinterested; for as our Author is an ecclessatic, he cannot avail himself of the privilege for which he is so zealous an advocate. Sic vos, non vobis, melificatis apes!

Mr. Madan not only thinks polygamy lawful in a religious, but advantageous in a civil light, and highly politic in a domestic view. 'It is to be feared (says he) that there are not a few semales who (like other monopolitis) take the advantage of the poor husband's situation to use him as they please: and this for pretty much the same reason why the as in the sable insulted and kicked the poor old lion—because it is not in their power to reserved from his wise men, the seven princes of Media and Persia, upon Queen Vashti's disobedience, would have an excellent effect, could it be followed. Many a high-spirited semale would have too cogent a reason against the indulgence of a restractory disposition not to suppress it. Her pride, which is now her husband's

husband's torment, would then become his security, at least in a great measure; for pride is a vice, which, as it tends to self-: exaltation, maintains univerfally its own principle—not to bear. the thoughts of a rival.'—The case referred to above may be found in the first chapter of Esther: and lest any of our Readers should not have a Bible at hand, or should be too indolent to turn to the passage, we will give the substance of it in its. own words. "What shall we do unto the Queen Vashti, according to law, because she hath not performed the command-ment of the King Ahasuerus by the Chamberlain? And Memucan (a Persian Prince) answered before the King and the Princes: Vashti, the Queen, hath not done wrong to the King only, but also to all the Princes, and to all the people that are in all the provinces of King Ahasuerus. For this deed of the Queen shall come abroad unto all women, so that they shall despise their husbands in their eyes, when it shall be reported, The King Ahasuerus commanded Vashti, the Queen, to be, brought before him, but she came not. Likewise shall the Ladies of Persia and Media say this day unto all the King's Princes which have heard of the deed of the Queen. Thus there shall arise too much contempt and wrath. If it please the King, let there go a royal commandment from him - that Vashti come no more before King Abasuerus, and let the King give her royal estate to ANOTHER that is better than she.—And the saying pleased the King and the Princes."—And our Author is not a little pleased at the reprifal that was thus made on the obstinacy of a haughty and disobedient wife. He laments the sad bondage of Englishmen, who cannot (by English law at least) avail themselves of this ancient privilege. How much would it make the husband look like a Man—the lord of his wife, the sovereign of his family, if he were permitted by the laws of the realm to fay to an undutiful Valhti-" Come no more before me:-I will give my hand, and thy jointure, to another who is better than thou!" But now (fays our Rev. Author, very pathetically) 'as things are with us, the poor man must grind in mola asmaria during life!

The fifth chapter is employed in establishing the doctrine of polygamy, by renewing the sanctions of the old law. His position is, That Christ was not the giver of a new law: —that the business of marriage, polygamy, &c. had been settled before his appearance in our world, by an authority which could not be revoked—an authority, which it was the great object of our Saviour to confirm and vindicate, both in life and death.—This leads him to obviate an objection that might arise from Matth. v. 31, 32.—xix. 9. Luke xvi. 18.—but with what success will be seen hereafter.

The

The second volume begins with chapter fixth, on divorce. Under this article he contends strongly for the indisfolubility of the marriage contract, as a sacred engagement sounded on a divine institution; and will only admit of adultery as a proper

plea for a divorce.

He renews his argument in defence of polygamy with fresh spirit, and will not permit his Reader to lose sight of the object which is nearest his heart. In his view, no prior connection of the man's side with any number of wives can be a just bar in point of conscience (however it may be in point of prudence) to fresh engagements or the same nature: but the woman who should dare to have, even but once, an intrigue with any other man but her husband (let him have as many wives as Solomon), would ipso facto be an adulteress, and ought, together with her gallant, to be punished with immediate death. This, he says, is the law of God: and he is perpetually lamenting the apostate spirit of later ages, that hath substituted the law of man in the room of it!

The seventh chapter treats of 'marriage in a civil view as the object of human laws.' Under this head he examines the nature and principles—the tendency and design, of the late Marriage-AA. He reprobates it with uncommon expressions of severity and indignation, and boldly avers, that 'it is a sacrilegious attempt to repeal the law of heaven.' Some of his observations on this subject are very sensible and pertinent, and well deserve the attention of the legislature.—Recurring to his bobby-borse, he says, that if polygamy was allowed and encouraged in Christian countries, 'the Mahometans and Chinese might be induced to embrace the truth as it is in Jesus.'

His eighth chapter, on 'fuperstition,' traces the corruptions that have taken place in the Christian church with respect to religion in general, and the laws of marriage in particular. Antichrist hath been equally dexterous in taking from and in adding to the Divine law. Mr. M. gives some curious examples of both; and thinks the Reformation hath but partially effected its great ends, while, at the time it permits the priesthood the comfort of one wise, it will not gratify the laity (whose wants must be more pressing!) with the quiet possession of two. To supply this desect, is the chief object of the present attempt. "If LUTHER be rewarded seven fold, truly MADAN seventy and seven!"

The ninth chapter treats of God's jealousy over his laws; and shews the infinite danger of departing from them, even in the minutest circumstances, under any plea or pretence whatever. He examines the tables of the commandments, and gives instances of God's judgments on those who have transgressed them.

them. The instances he produces are very frightful ones; and they are produced with such an air of puritanic solemnity, that we should not be surprised if we were informed that some poor, timorous souls had been absolutely scared into polygamy, in order to sulfil the whole law of God: for he positively avers that it is, in some cases, a duty; in many cases, expedient; and in all, lawful.

After having produced abundance of terrible inflances to prove God's jealoufy over his laws—amongst which is twice noted the case of the poor 'man who was stoned to death for gathering a few sticks on the Sabbath-day'—he concludes in his own presumptuous and decisive language, that 'if it could be proved that, in any one instance, Christ added to or diminished from the law of God, by ordaining any thing contrary to or inconsistent with it, it would be making him a greater impostor than Mahomet.' This mode of expression (even granting there may be in a strict, logical sense, some truth in it) is so shocking and indecent, that the car of a modest and humble Christian must be wounded by it. Our veneration for Christ, and our esteem for the sacred Scriptures, are too great, to hear such language (on any supposition that fancy may suggest) without emotions of indignation and disgust.

The tenth chapter is designed to prove the great advantage which the Jewish institutions and regulations had over ours, with respect to 'population:' and having drawn a parallel between the Divine law and human inventions, on the subjects treated of in this work, the Author observes in the conclusion, that 'his real design was to remedy the desects of the latter on the evidence of the former, and to recommend the whole to the most serious consideration of all men, but more especially to the legislative powers. How this hath been executed, is left to the Reader to determine.'

The Author distains to alk favour of any one; and, by his account of himself, is fortified against the power of critics and the reproach of cavillers; and is prepared to hear with calm indifference, and silent contempt, all that may be said against him and his book, by objectors and disputers of this world, whether they be of the set of the Pharisees or of the Sadducees.

As we pretend not to be the judges of any man's conscience, we shall leave this Author's intentions and private views to himself. Whether they were honest or infincere, is not our business to determine. As to the work itself, we consider it as of the most pernicious tendency: and, in spite of all that solemnity which is thrown over it, we think it, on the whole, far better calculated to encourage the libertine, than to edify the Christian.

We apprehend we shall do some service to the interests of virtue and religion, by exposing the fallaciousness of this Writer's reasonings,

reasonings, particularly under the articles of marriage and polygamy;—which articles indeed may be said to comprehend the main scope of his argument, and contain the prime object of his

wishes in this publication.

We have before given our Readers the Author's idea of mar-'Its essence (says he) lies in the union of man and woman as one body; for which plain and evident reason, no outward forms or ceremonies of man's invention can add to or diminish from the effects of this union in the fight of God.' Mr. M. indeed pretends not to call in question the propriety of an outward recognition of this union for the fecurity of the parties in a civil and political view; but he contends strongly for the invalidity of all outward forms in the fight of God. His doctrine of marriage is more strongly expressed in vol. ii. p. 173, under the chapter of Superstition. 'To fay that a virgin who delivers herself into the possession of the man of her choice with an intent to become his wife, fins in so doing, unless an outward ceremony of man's device be first performed, is to say what the Bible hath no where said. All that God hath said in such a case, is, that "they shall be one flesh-that she shall be the " man's wife—and that he may not put her away all his days." So that all contrivances which hinder the operation of this law, are not only so many snares laid for the conscience, which may enthral and bring it into subjection to the pride and arrogance of man, but are big with every mischief which the Divine law was enacted to prevent.'

Mr. Madan produces the decisions of the Lollards on this head, in order to give some credit to his own principles. P. 149, The Lollards (says he) laid it down for sound doctrine, that, if a man and woman come together with an intention to live in wedlock, this intention is sufficient without passing through the forms of the church." This certainly (says our Author) is sound doctrine, because agreeable to the word of God, where no ceremony appears to have intervened to constitute a lawful marriage in the sight of God.

This licentious polition (for we cannot give it a milder epithet, confidering the present established customs of the Christian church) is an object of so much consequence in our Author's view, that he resumes the argument in several parts of his treatise, and frequently goes over the same ground of proof, till he becomes so very tedious, that the Reader is ready to find disgust

take the place of conviction.

Mr. M. lays the chief stress of his argument on the Hebrew words made use of in Gen. ii. 24. to express the primitive institution of marriage, viz τρως τρως rendered by the LXX. ΠΡΟΣΚΟΛΛΗΘΗΣΕΤΑΙ προς δην γυνχικα αυδε; which translation is adopted by the evangelist (Matt. xix. 5.) with the omission

omission only of the superstuous preposition ( $\pi pos$ ) after the verb. Our Author approves of Montanus's version as most expressive of the literal meaning, viz. Adhærentes IN uxore. Our translation (fays he, vol. ii. 144. compared with vol. i. 20.) shall cleave TO his wife-doth not convey the idea of the Hebrew, which is literally - shall be joined or cemented IN his woman, and they shall become (i. e. by this union) one flesh. The more (continues he) I have searched the Scriptures and examined this point, the more fully am I convinced, even to demonstration itself, that God never appointed any thing, as to the matter of that union by which the man and woman become one flesh, but the דבק באשתן, or, as our canon law phrases it, carnal knowledge—the very ESSENCE of which is expressed in the Hebrew; though perhaps our translators thought it more decent to render it as they have done, without giving the \( \) [or IN] its literal and usual import. The mposxoddn9noslas of the LXX. and of St. Matthew, taken in connection with the πολλωμείος of St. Paul, 1 Cor. vi. 16. amount to the same meaning, and carry the same idea, if compared and interpreted with the Hebrew original.'

In all this parade of biblical learning, there is scarcely one grain of solidity. Both the Hebrew and Greek terms mean simply and literally attachment or adherence; and are evidently made use of in the sacred writings to express the whole scope of conjugal sidelity and duty, though this Author would restrain

them to the groffer part of it.

If our learned Readers will confult Deut. iv. 4. and Joshua xxiii. 8. (and we could, if necessary, point out many other passages of the same import) in the original, they will find the same verb, and what is still more, the very same preposition on which Mr. M. lays such singular stress, made use of to express sidelity and adherence to the Lord. ביהוה הדבקים is rendered by Montanus (on whose literal exactness of translation Mr. M. places much considence) adhærentes IN Domino.

His Greek will avail him as little as his Hebrew, as our Readers may be convinced by turning to Acts v. 36. where the very word, which our Author would so interpret as to apply it solely to the conjugal act, is used in its general and more obvious acceptation, and simply means adherence. ω (viz. Theudas, the Jewish impostor) ΠΡΟΣΚΟΛΛΗΘΗ αριθμος ανδρων—rendered very properly in our translation—to whom a number of men Joined themselves.

We will not dispute with Mr. M. about the outward forms of marriage. They may vary with the various institutions of civil government. But from the earliest ages of the world, and among people too, whose modes of civilization have not acquired much refinement, something more than the bare act of cohabitation.

cohabitation, hath been deemed necessary to stamp credit or validity on the union of the sexes. It is equally impertinent and evalive to refer to the original union of our first parents in order to discredit the forms of marriage; because so singular a case, like the marriages of their immediate offspring, cannot with any appearance of reason or propriety be produced as a precedent for future times. When the earth was replenished with inhabitants, the forms both of religion and polity were adapted by the wissom of the Creator to the situation and condition of mankind, and rendered subservient to the peace and in-terest of society. These forms become in some degree essential to the government of such a state: and the man who should attempt to discredit their institution, or lessen their influence, under a pretence of establishing what he calls the pure, primitive, and ONLY law of God, would subject himself to the charge of great imprudence, if not the more heavy accusation of licentiousness, and be justly deemed an enemy to society, by attempting to unfettle the order and weaken the supports of it.

Mr. Madan's position respecting marriage might suit a state of innocence; but in a state of impersection, such as the present is, and, without a perpetual miracle, must necessarily be, his doctrine is too lax and unguarded to be permitted to take place in civil society; and if it were established, its pernicious effects would soon demonstrate its impolicy, and call loudly for a re-

peal.

The act of cohabitation is in our Author's view a real, unequivocal, and perfect marriage of itself, and ought to be regarded as such by the parties; and in every case, where a virgin is the subject, ought to be enforced as such by the authority of law. How far such an act ought to be recognised and sanctified by a legal marriage, is a point of honour and private duty, and ought to be decided by every man's conscience, on honest and impartial principles, as in the fight of God. Seduction is a crime of the blackest die; and we fincerely wish it were more open to the cognizance of the law. But to establish a law, that should by the itrongest penalties enforce the obligation of marriage on every man who hath defiled a virgin, would introduce a train of the most perilous consequences to civil and domestic peace, and would open a door for the groffest impositions that the cunning and address of one sex could practise on the credulity and indiscretion of the other.

Mr. M. is a warm advocate for the policy and equity of the Mosaic law, and is anxious to revive a great part of it in this country—especially so far as it regards the commerce of the sexes. We esteem and venerate the Mosaic economy, both ecclesiastical and civil, as much as he;—but we regard it as a local and temporary institution; and admire it because it so perfectly

fectly answered the ends for which it was appointed. Every state is at liberty to adopt what part of it best suits its constitution; and so far as its polity is inconsistent with the genius of that constitution, so far it may and ought to be rejected. As to the moral law, that is, indeed, the basis of justice and equity to every state, because its rules are founded on the common principles of human nature, and are inseparable from the general order and interest of mankind.

The laws respecting marriage are evidently peculiar, in many cases, to the genius of that circumscribed policy which was instituted for the preservation of the Jewish people; and were admirably calculated to answer the great ends of their separation from the Gentiles. We shall illustrate this remark more particularly hereafter, in some striking instances which immediately relate to the union of the sexes: -at present, we would observe, that unless Mr. Madan can make it appear that the figns of virginity are as infallible, amongst all people and through every age, as they were pronounced to be under the Mosaic institution, the law which he is so anxious to renew would lay a foundation for jealousy on the one side, and fraud on the other, too pregnant with mischiefs to be even thought of with indifference.

Our Author observes (vol. i. 23.), that, 'though we find every particular down to the very pins of the tabernacle; every rite and ceremony, even to the minutest circumstance, exactly delineated and revealed to Moses by "the pattern shewn him in the Mount," yet we find no marriage-service, or religious ceremony of an outward kind, so much as mentioned. nels of marriage, as at first ordained, was confined to the one

Simple act of union.'

To support this hypothesis, our Author is under the necessity of obviating a very capital objection, that naturally arises from Exod. xxii. 16, 17. "If a man entice a maid that is not betrothed, and lie with her, he shall surely endow her to be his wife. If her father utterly refuse to give her unto him, he shall pay money according to the dowry of virgins "-The objection arising from this text is obvious. If marriage is actually completed by the mere carnal knowledge of each other's persons, they were to every possible intent, in the fight of God, lawful man and wife, upon Mr. Madan's plan, and no law could have put them asunder, because they had been joined by a divine ordinance, which is superior to every other institution under heaven. And yet from this passage in the Mosaic ritual, we learn very clearly, that a parent had the power of disannulling every obligation arising from a union of this nature: the confequence is, that this union, though carnal, was not indiffoluble, as it must necessarily have been, in spite of the will or authority of any parent whatever, if Mr. Madan's supposition were true. -Now

-Now to evade the force of this objection, which would instantly annihilate his whole system of marriage, he gives the following shrewd and ingenious turn to the translation of the passage above quoted. "If a man entice a maid, &c.—he shall furely endow her to be his wife. THOUGH the father utterly refuse to give her, he shall pay money, &c." 'This (says he) is but explanatory of what goes before, "he shall surely endow her to be his wife," by paying the dower into the hands of the father after the marriage, as was usually done and ought to have been done beforehand. The dowry is supposed to be the portion paid by the husband into the hands of the bride, or her father, as a kind of purchase of her person. This is to this day the practice of several eastern nations; and this was not to be with-held because the husband had married the woman either soithout or against her father's consent. In short, the man was not to take advantage of his own wrong. But [ ] though the father refused or not, the dowry must be paid according to law,'

In the liberty which Mr. M. hath here taken with the text, be hath departed from the authority of his favourite Montanus. And we may further observe, that every instance (except perhaps in one) which he hath produced to corroborate his translation, DN might as properly be translated IF as THOUGH; and in ninety-nine examples out of a hundred it is used hypothetically through the whole Bible. Indeed the exceptions are so seen, and those so equivocal and indecisive, that no man, unless violently bent to serve a cause at all hazards, would exalt any of them into authorities; especially when the sense of the passage evidently requires the general translation that is affixed to the word.

But not to dwell on these verbal criticisms, we think we can make it appear, that the passage in question establisheth its own meaning by the clearest evidence possible. As for Mr. Madan's hypothesis, it overthrows itself; for it virtually annihilates that parental authority, which made such a distinguishing part of the Jewish ritual. If a father utterly refused to give his daughter to the man who folicited her in marriage, he was not denied, on Mr. Madan's conjecture, the privilege of getting her without his consent. If he could entice her to lie with him, the marriage was completed by that very deed; nor could the authority of the parent destroy the union, nor in the slightest degree lessen the validity or impeach the fanctity of it. Nor was any punishment to be inflicted on the daughter for this gross violation of duty; nor was any extraordinary mulch levied on the hufband for having been the occasion of it, and thus a partaker with her in disobedience. He was only to pay the dowry; -and that was no more than would have been demanded of him, and he

must have paid, even if he had gained the father's confent. Consequently on this plan, there was no security made for parentil authority; for in the event the matter was to be precifely the same, whether the father utterly refused or voluntarily confented to the marriage of his daughter. How abfurd the supposition! But the absurdity is wholly chargeable to our Author's perversion of the text. The text is sufficiently clear; and means -what it hath been univerfally supposed to mean till sophistry tortured it into nonlense and contradiction, -viz. - that if a man entice the affections of a virgin, and so far impose on her credulity or her passions, as to gain her consent to a premature enjoyment of her person, he was obliged to prevent her shame and mifery, by making her his wife. None could put a negative on their further and more folemn union by public marriage EXCEPT the father. If he utterly refused to give her unto him (and the law presumed that, if he did refuse in such a case, he had undoubtedly prudent and just reasons for it), yet that refusal would not exempt the feducer from some kind of punishment. He was to make such a satisfaction for the injury he had done, as the law had directed in fimilar cases. "He was to pay money according to the dowry of virgins." In other words, that sum which would have been demanded of him as a dowry, or fettlement, in case the parent had consented to his marriage, must now be paid as a fine for his feduction of the daughter.— Viewed in this light, there is some meaning in the law; but in Mr. M.'s representation of it, the law is made to destroy itself.

This Writer, in his attempts to depreciate the outward forms of marriage, would make his readers believe, that because none are explicitly described, therefore none existed; the consequence on his scheme is, that they are the superfluous ordinances of human policy. But furely he cannot but know that fome forms were deemed effential to an honourable alliance by the patriarchs and faints under the Old Testament, exclusive of the carnal knowledge of each other's persons \*. If the latter took place before the customary forms of marriage were complied with, it was judged a shameful act. The case of Dinah, the daughter of Jacob, clearly proves this. According to Mr. Madan's hypothesis, she was actually married to the Prince of Sechem. But the Scripture expressly says, that " he took her, and lay with her, and desiled her." It was after this act that he said to his father, 66 Get me this damsel to wife." [Vid. Gen. xxxiv.] It is evident from the chapter where this circumstance is related, that her brethren's rage was excited, because they considered the connection not fo much unlawful (on account of the uncircumcifion of the Prince) as criminal and foundalous, because it had taken place without

<sup>\*</sup> Compare Ruth iv. 10-13. with Tobit vii. 13, 14.

those previous forms and stipulations that were judged necessary to ratify a legal marriage. This is evident from the reply that they made to their father, after he had expossulated with them for their cruelty towards the Sechemites—" Should he deal with our fister as WITH AN HARLOT?" i. e. Should her person be enjoyed as a harlot's is wont to be, without those previous requisites which are deemed necessary to credit and sanctify the act?

The pretence of uncircumcision was afterwards pleaded by Dimah's brethren in bar to any farther alliance between her and Sechem:—but in this, they dealt deceitfully, it is said; for it was only fet up for the foul purpose of taking a deeper revenge than they could otherwise have effected. Marriage with the uncircumcifed, though discouraged, was not, as far as we can learn, forbidden by any positive and explicit law to the earlier patriarchs: and even after they had been forbidden, and the law was in the greatest force, particular cases were exempted from the general rule; and marriages with heathen families were neither deemed criminal nor impolitic. Moses himself married an outlandiff woman (as she was scornfully termed by the splenetic zeal of Aaron and Miriam), and Sampson a daughter of a Philistine; and both, under the sanction of the Divine approbation. Thus also Esther was given in marriage to a heathen monarch. We might produce a variety of cases more, to shew that necessity would fometimes require the dispensation of a law which was only ordained to operate as a general restraint on intermixed marriages, though it would have been cruel and impolitic to have applied it with an unrelaxed severity to every particular Had the bare act of cohabitation been regarded as a real and valid marriage by the patriarche, would not the law (if any fuch law had at that time existed) forbidding, for political reasons, the marriage of the Israelites with the people of other nations, have been dispensed with in a case so pressing and peculiar as that of Dinah's? Or could what Mr. M. calls the primitive and original law of God, be revoked by any secondary and subordinate ordinance, not founded on nature, but on policy? In short, the matter is very clear from this circumstance respecting Jacob's daughter, that her brethren were enraged, not because she was married by this act of cohabitation with Sechem, but because the was defiled by it; and thus no marriage having been folemnifed between them, they regarded the connection as infamous, and confidered their fifter as having been treated as a harlot, and not as a wife.

Mr. M. though he hath been totally filent about the case of Dinah, is yet ingenuous enough to take some notice of the woman of Samaria, whose connection with a man not her husband is mentioned in John iv. Now from this circumstance it is

(fays

(fays our Author) inferred, that fomething besides cohabitation is necessary to constitute marriage in the fight of God. But (in answer to this inference) let us suppose, says he, that four of this woman's husbands were dead, or had divorced her for adultery with another man; that under either of these circumstances, she had married a fifth hysband, whom she had deserted, and lived in adultery with another man; the certainly had had five husbands. and the man with whom she now lived in adulterous commerce, perhaps clandestinely, could not be properly stiled her husband, nor the his wife.'

Now the whole weight of this most evalive reasoning refts on the feeble ground of a fancied conjecture, in direct contradiction to the obvious fense and letter of the passage, when one part of it is viewed in connection with another. Let our Readers judge.—" Jesus said unto her, Go, call thy husband. The woman answered and said, I have no husband. Jesus said unto her, Thou hast well said, I HAVE no husband; for thou HAST HAD five husbands, and HE whom thou now HAST is not thy HUSBAND. In that faildft thou TRUELY." Now if the fifth husband had not been dead, or the band of marriage actually diffolved (which was all one with respect to the liberty the woman would have acquired), would our Lord have faid that the spoke the truth, in declaring that the had no husband at the time he was conversing with her? For, on Mr. Madan's conjecture, the actually bad a busband at that very time, though perhaps the had deserted him. Thus, our Author, to ferve the wretched purpose of his PERHAPS and SUPPOSE, will indirectly charge his Saviour with fallity, or at least equivocation:—we say indirectly, for we charitably believe that he was not aware of the consequences that would result from the

admission of his hypothesis,

If Mr. M. chuses, we have no objection to read the last clause of the passage in the following manner—" He whom thou now hast is not THY husband:" i. e. He is the husband of another woman, and consequently he cannot be a husband of

But if we give it this sense, how will his system of POLYGAMY fland?

[To be continued.]

 $\mathbf{p} \cdots \mathbf{k}$ 

ART. VI. Experiments establishing a Criterion between Mucaginous and Purulent Matter: And an Account of the Retrograde Mottons of the Absorbent Vessels of Animal Bodies in some Diseases. By the late Mr. Charles Darwin. 8vo. 2 s. 6 d. Cadell. 1780.

THIS posthumous work, independent of its intrinsic merit, cannot fail particularly to attract the notice of every Reader possessed of sensibility, by the affecting circumstances attending

tending its publication. It is a monument, too prematurely erected by parental piety, to the memory of a departed fon; of whose ingenuity and industry these pages afford a very striking specimen; and who was carried off by a fever, before he had completed his twentieth year, while he was profecuting his medical studies at Edinburgh. The father of this youth, who is the Editor of this performance, is the worthy and ingenious Dr. Darwin of Litchfield.

The first of the two pieces which constitute this literary collection, is a Differtation of the late Author, containing an account of the experiments made by him, with a view to afcertain the best criterion between pus and mucus; and for which a gold medal had been adjudged to him by the Æsculapian Society

at Edinburgh, scarce two months before his death.

The utility of discovering a certain criterion, by which these two fluids might be distinguished from each other, is as evident as is the fallacy of the tests which had hitherto been proposed to ascertain the difference between them :- particularly with respect to the phenomena attending the trial, originally proposed by Hippocrates, of dropping them into water, or rather sea-water; where it was supposed that mucus would swim, and pus fink to the bottom. The presence or absence of air bubbles, however, renders this criterion highly fallacious. Van Swieten has obferved, as the late Author remarks, that one portion of expectorated matter would swim; while another part of the same matter would fink: and further, that what had swam in the morning would fink in the evening.

Equally deceitful are the indications from the colour of the matter, and from the fœtid smell; by which last it has been thought that pus might be distinguished from mucus. But pus, the Author observes, has often no bad smell; and a disagreeable fmell is frequently perceived in the mucus excreted in some pe-

riods of a common catarrh, or coryza.

Mr. Darwin's observations are comprehended in 35 experiments; in which pus, mucus, and coagulable lymph, were subjected to the action of the three mineral acids, and of the mild and caustic fixed alcalis. From these he deduces the sollowing among

other conclusions:

That pus and mucus are both foluble in the vitriolic acid; though in very different proportions; pus being much the less foluble of the two: and that by the addition of water to either of these solutions, they are decomposed; the mucus swimming at the top, or forming large flocci in the mixture: whereas the pus falls to the bottom, and, on agitation, forms a uniform turbid mixture: - that alcaline lixivium generally dissolves pus, and, fometimes, though with difficulty, mucus; but that, on the addition of water, the pus is precipitated, but the mucus is not affected.

From the whole of his experiments the Author deduces this observation: If a person wishes to ascertain the nature of any expectorated material, 'let him dissolve it in vitriolic acid, and in caustic alcaline lixivium; and then add pure water to both solutions: and if there is a fair precipitation in each, he may be assured that some pus is present. If in neither a precipitation occurs, it is a certain test that the material is entirely mucus: if the material cannot be made to dissolve in alcaline lixivium, by time and trituration, we have also reason to believe that it is pus.'

The next Differtation was defigned for the late Author's inaugural thefis; and is here translated from the original Latin. It contains many curious and original observations on the retrograde motions of the sluids contained in the absorbent vessels; and on the diseases producing, or produced by, these aberrations of the absorbent vessels from their usual or natural functions.

After giving a short account of the system of absorbent vessels, the Author proceeds to shew, that though the valves, with which the lymphatic and lacteal vessels are furnished, may seem to form insuperable obstacles to the regurgitation of their contents; yet it is possible that these valves may not, under certain circumstances, and in certain diseases, so completely close the vessels, as to prevent the retrograde motion of their contents. He afterwards shews, that such an inverted motion actually takes place on several occasions.

A mechanism analogous to that of the absorbent system occurs even in some of the larger and more conspicuous organs; which, in a diseased state, are frequently known to regurgitate their contents. Thus, says the Author, 'the upper and lower orifices of the stomach are closed by valves; which, when too great quantities of warm water have been drank, with a design to promote vomiting, have sometimes resisted the utmost efforts of the abdominal muscles and diaphragm: yet, at other times, the upper valve, or cardia, easily permits the evacuation of the contents of the stomach; whilst the inserior valve, or pylorus, permits the bile, or other contents of the duodenum, to regurgitate into the stomach.'

On this occasion the Author takes particular notice of a phenomenon which has been frequently observed; and which has induced many physiologists, both ancient and modern, to suspect, that there was a nearer or more direct communication between the stomach and urinary bladder than that of the circulation. This suspicion has been sounded—on the quickness with which a great quantity of cold water, drank by a person heated by exercise, passes off by urine:—on the quick and large flow of Rev. Oct. 1780.

urine which passes at the beginning of intoxication:—on the smell of this urine, resembling that of particular substances swallowed not long before:—on experiments made on brutes, where the ureters have been tied:—and on particular instances in the human species, where the kidneys have been totally obliterated by suppuration; and yet, in both cases, the urine has continued to

país.

From all these instances, it appears reasonable to conclude, that sluids may pass from the stomach or intestines, without having previously entered the blood vessels, or performed the course of the circulation. The urinary lymphatics, the Author observes, after Hewson, are joined with the intestinal absorbents, by numerous anastomoses: and as there is no other expeditious road from the stomach to the bladder; he very plausibly infers, that the sluids above mentioned are conveyed restifine cursu, and with their tastes and odours not much changed, by the urinary branch of the lymphatics; the natural or usual motions of which are inverted, in consequence of the disordered state of the animal. On this occasion he relates the following curious experiment:

- The more certainly to ascertain the existence of another communication between the stomach and bladder, besides that of the circulation, the following experiment was made, to which I must beg your patient attention:—A friend of mine (June 14, 1772), on drinking repeatedly of cold small punch, till he began to be intoxicated, made a quantity of colourless urine. He then drank about two drachms of nitre dissolved in some of the punch; and eat about twenty stalks of boiled asparagus. On continuing to drink more of the punch, the next urine that he made was quite clear, and without smell; but in a little time another quantity was made, which was not quite so colourless, and had a strong smell of the asparagus. He then lost about four ounces of blood from the arm.
- The smell of asparagus was not at all perceptible in the blood, neither when fresh taken, nor the next morning; as my-felf and two others accurately attended to: yet this smell was strongly perceived in the urine, which was made just before the blood was taken from his arm.
- Some bibulous paper, moistened in the serum of this blood, and suffered to dry, shewed no signs of nitre by its manner of burning. But some of the same paper, moistened in the urine, and dried, on being ignited, evidently shewed the presence of nitre. This blood and the urine stood some days exposed to the sun in the open air, till they were evaporated to about a fourth of their original quantity, and began to stink. The paper, which was then moistened with the concentrated urine, shewed the presence of much nitre by its manner of burning;

whilft that moistened with the blood, shewed no such appearance at all.

'Hence it appears, that certain fluids, at the beginning of intoxication, find another passage to the bladder, besides the long course of the arterial circulation: and as the intestinal absorbents are joined with the urinary lymphatics by frequent anastomoses, as Hewson has demonstrated; and as there is no other road, we may justly conclude, that these sluids pass into the bladder by the urinary branch of the lymphatics, which has its motions inverted during the diseased state of the animal.'

Two other cases, which occur afterwards in the notes subjoined to this performance, tend strongly to confirm the Author's

hypothesis on this subject.

The subject of the first of these cases had long laboured under a diabates. He had for some time drank sour pounds of suid, and passed twelve pounds of urine daily. Each pound of the urine was sound to contain an ounce of sugar: nevertheles, Dr. Home, who had read the Author's thesis in manuscript, sound, on taking some blood from this patient, that 'neither the fresh blood nor the serum tasted sweet.' On opening his body after death, no morbid appearances were observed, except that the lest kidney had a very small pelvis; and that there was a considerable enlargement of most of the mesenteric lymphatic glands.

The other case was communicated to the Editor by Mr. Hughes of Stafford; who informed him, that, from two quarts of urine of a patient in the infirmary at that place, who was affected with a chyliserous diabætes, he had obtained four ounces and a half of a hard and brittle faccharine mass, like treacle which had been some time boiled:—but that sour ounces of blood, which he had taken from the patient's arm, with design to examine it, had the common appearance; except that the serum resembled cheese-whey; and that, on the evidence of sour persons, two of whom did not know what it was that they tasted, the serum, instead of a saccharine, had a saltish taste.

These two cases shew, that the saccharine matter, with which the urine in diabætic patients so much abounds—like the nitre and asparagus which were swallowed during the drunken diabætes above mentioned—had not entered the blood vessels, or performed the course of the circulation. It is afterwards observed, that the process of digestion resembles that of the germination of vegetable grains, or of the making barley into malt; as the vast quantity of sugar sound in the urine of the last mentioned patient, must have been made from the sood which he took, in very large quantities; and from the great quantity of small beer which he drank. And it is surther observed, that, as the ferum of the blood was not sweet, the chyle appears to have been conveyed to the bladder, without having previously entered

the blood vessels; since so large a quantity of sugar as was found in the urine—not less than 20 ounces in a day—could not have existed in the blood without being perceptible to the taste.

A passage which we have met with, in M. Macquer's excellent Distionary of Chymistry, under the article Urine, is so very applicable to the present subject, that we cannot resist the tempt-

ation of transcribing it.

After observing that certain odoriferous substances, taken inwardly, fuch as asparagus, turpentine, and others, quickly communicate their peculiar smells to the urine even of a person who is in a state of perfect health; he adds-" But I have also seen persons subject to pains of the head, and whose digestion has been laborious and painful, in consequence of an hysterical or hypochondriacal temperament, who have discharged urine in which I could most evidently perceive the smell of coffee, spices, onions, fruits, herbs, and even of broths, when they had taken nothing else; in short, of any food which they had swallowed that had the least odour. The urine of these perfons was constantly acid, and always reddened syrup of violets and blue paper, when it was first discharged; especially after they had eat fruits and greens, and drank even a small quantity of wine."——This last observation tends to confirm the hypothesis of Mr. Darwin. It is well known that the urine of persons in health, even when first discharged, is so far from exhibiting appearances of acidity; that a strong odour of volatile alcali is immediately perceived on adding a little fixed alcali to it. The uncombined acid, therefore, in the urine of these hypochondriacal persons, must probably have been the native acid of the fruits, &c. which they had swallowed, and which had passed, unchanged, through the channels pointed out by Mr. Darwin, directly to the bladder; or it possibly may, in some cases, have been generated, by these fruits or other aliments undergoing the acetous fermentation in the prima via.

Having thus shewn that there subsists a communication between the alimentary canal and the bladder, by means of the absorbent vessels; the ingenious Author next proceeds to shew that the phenomena of many diseases, or morbid symptoms, are only explicable from the retrograde motions of the sluids contained in some of the branches of the lymphatic system; which have a certain sympathy with each other: so that when one branch is stimulated into unusual kinds or quantities of motion, some other branch has its motions either increased, or diminished, or inverted, at the same time. To the same cause, or to the occasionally retrograde motions that take place in some of the branches of the lymphatic system, he ascribes those sudden translations of matter, of chyle, of milk, and of urine, of which so many remarkable instances have been recorded; as it is certainly

difficult

difficult to conceive, on any other system, how these different suids, supposing them to have been absorbed into, and mixed with, the whole mass of blood, could have been so hastily separated from it, as well as collected and transferred to any one part.

For the many other ingenious observations and hints contained in this essay, we must refer our medical and philosophical Readers to the work itself:—not however without first sincerely sympathising with the father of this excellent youth; and lamenting the loss which the Public have sustained in the premature death of one, whose early exertions in the cause of science, and whose extraordinary natural talents, improved by a judicious mode of education, described in his Life affixed to these Essays, were such, as would undoubtedly have enabled him, had his life been spared, to realise the most sanguine expectations of his friends.

## F R A N C E. A R T. VII.

ESCRIPTION des principales Pierres gravées du Cabinet de S. A. S. Monseigneur le DUC D'ORLEANS, Premier Prince du Sang. Tome I. Paris. 1780.—A Description of the principal Gems in the Cabinet of the Duke of Orleans. Fol. p. 303.—This is the first volume of a work, which, when it is completed, will form one of the most splendid, elegant, and useful publications concerning the subject of the fine arts during the period of their highest cultivation in ancient Greece.

The volume which we have now the pleasure to announce, contains 95 plates, designed and engraved after the ancient models, with equal accuracy and taste, by M. de St. Aubin, one of the first artists in France. The description is given by Messrs. the Abbés De La Chau, and Le Blond, assisted by the erudition, taste, and judgment of the Abbé Arnaud, whose ingenious Discourses, published in the Memoirs of the Academy of Belles Lettres are so well known, and so generally admired by the learned of Europe.

When we consider the different objects of human knowledge, in relation either to the utility or the pleasure which the study of them is calculated to afford, the history of the arts seems more important than that of empires. Yet the latter, as it addresses itself more directly to the passions of men, has always obtained a greater share of their attention. It is easier to pull down than to build; more pains are required to establish than to destroy; and it has always been a more common, because a less difficult task, to describe sieges, battles and conquests, than to trace the

U 3

gradual improvements of the human mind, in works of real in-

genuity and use.

Of all the monuments of ancient art, there is none from which we may derive more various and more agreeable instruction than from the engravings on precious stones. These invaluable defigns often present us with exact copies of the most admired Grecian statues still remaining; from which there is reason to conclude, that many pieces of sculpture, of which the originals have unfortunately perished, are preserved and perpetuated in the devices of these inestimable gems; on which we see expressed, with inimitable art, the images and ensigns of the several divinities; the characters and exploits of kings and heroes; the most striking peculiarities of ancient customs and institutions; and all the complicated variety of religious and moral allegory.

The wide diversity of subject to which these emblems relate, shows the great extent of knowledge necessary for explaining them with success; and we will venture to pronounce, that notwithstanding the many learned and elegant performances that have been published on this subject since the revival of letters, there is none more deserving of regard than the work before us, whether we consider the beauty and accuracy of the designs, or

the learning and ingenuity of the description.

The judicious Authors have given us a very just and candid criticism on the labours of their predecessors in this walk of literature. The collection of Agostini, which is one of the most ancient, is chiefly valuable on account of the engravings of Galestruzzi; but the explanations accompanying them are not remarkable either for learning or for taste. Bellori gave a new edition of this work, which was afterwards successively improved by Gronovius in Holland, and by Massei in Italy; but after all these corrections, the work of Agostini is not very complete or very useful.

A few years after the publication of Maffei, Beger gave to the world feveral large volumes of indigested erudition; dissufwithout perspicuity; learned, but not instructive. His engravings are neither designed with accuracy, nor executed with taste. La Chausse, who succeeded Beger, labours under an opposite desect. His explanations are too succinct to be intelligible; and he was very little acquainted with the art which he under-

took to illustrate.

Baron Stosch had principally in view to collect such gems as contain the names of the artists who engraved them; to compare their different excellencies; and thus to form a judgment of their respective merit. Considered in this view, his work is extremely curious. It is only to be regretted, that he was not assisted by an artist of more industry and skill than Bernard.

Picard. The performance of Gravelle is, notwithstanding its rapid sale and its success with the Public, rather a catalogue than a description; and we never find in his copies that purity, simplicity and fire, which distinguish the noble originals. Montfaucon, in his pompous book, L'Antiquité expliquée, speaks of ancient monuments of art, like a man who had seen them in a dream. The learned and indefatigable Gori has examined ancient gems with much erudition and confiderable knowledge of art; but of him, as well as of Spence, Wilde, Ebermayer, and Ficoroni, it may be said, that none of them have illustrated the subject by the light of philosophy, penetrated to a sufficient depth into the mysteries of heathen mythology, or discriminated the various productions that fell under their review, with fuch attentive accuracy as was necessary to explain their several beauties and defects, and to characterife the style of their respective authors.

The Count of Caylus joined the habit of uncommon industry to a natural taste for the arts. His time and his fortune were equally consecrated to the study of antiquity. He distained not the affistance of the learned and ingenious in every part of Europe. The severity of a jealous eye may discover some mistakes and impersections in his numerous publications; but it is impossible to deny him the merit of making useful discoveries, and of smoothing the road of knowledge to those who suc-

ceeded him.

To the encouragement of Count Caylus the Public is indebted for the excellent treatife on engraved stones by M. Mariette, whose long and extensive travels, whose general correspondence with men of letters, and whose connection with the celebrated Bouchardon, conspired to enable him to do justice to the immense treasures of the French King's cabinet, which was submitted to his review and examination. In the first part of his work, he gives the history of the art of engraving on precious stones, a general account of the artists, and, in a word, whatever concerns the subject of Dactyliography. His second volume is destined to explain the ancient monuments of this kind belonging to his most Christian Majesty; and here it is to be regretted, that he has confined himself to too narrow limits to apply and illustrate the principles which he had been at great pains to establish. The style of Bouchardon too much prevails in his plates, to allow us to suppose that they have been copied with the most scrupulous fidelity. It is not easy for a great artist to submit to a servile imitation of a whole composition. But we cannot agree with the Authors of the work before us, that the correctness, purity and elegance of Bouchardon's designs compensate for the desect of an exact imitation of the original. When a French translator or artist is tempted to embellish a Grecian model, he should remember that the taste of France is, like that of the other modern countries of Europe, fluctuating, particular, and temporary; that of ancient Greece is universal and permanent. We never see an aukward attempt of this kind, to improve the invaluable monuments of ancient literature or art, but we recollect a celebrated print, in which a French dancing-master, placed by the statue of Apollo, desires the graceful divinity to hold up his head,

" Levez la tête, Monsieur l'Apollon."

In speaking of the learned men whose labours have diffused. the knowledge of antiquity in France, the Authors of the prefent undertaking do not forget the celebrated Peiresc, who was one of the first that formed a copious collection both of gems and medals, at a time when the cultivation of fuch studies was very little regarded in that kingdom. Since his time the science of medals has been greatly improved, particularly by M. Pellerin, who has described with great erudition the numerous medallic curiofities of which he was possessed, and which being now added to the cabinet of the French King, form the most magnificent collection in the world.

After all these skilful antiquaries, there was still room for the labours of the Abbé Winckelmann, which have illustrated the remains of ancient statuary. In his work, entitled, The History of the Arts of the Ancients, this accomplished antiquary has described the Apollo of the Belvedere, the Venus of Medicis, the Laocoon, and other productions of Grecian sculpture, with a warmth of style and expression which vies with the chissel of the inimitable artists who have been immortalised by these masterpieces of genius. His description of the gems in the cabinet of Baron Stoich is a model in its kind. In all his works, learning is accompanied with taste; and he never mentions any monument of antiquity which does not furnish useful ideas for promoting the progress of the arts.

This panegyric of the Abbé Winckelmann is justified by the judicious use which the Authors have made of his observations in explaining the cabinet of the Duke of Orleans. That the curious Reader may know what entertainment he has reason to expect from their work, we shall give a list of the plates, and shall infert a translation of a few of the principal descriptions.

nos. Leander.

Perseus and Medusa.

We proceed to give a few examples of the manner in which the Authors have explained these interesting subjects. In speaking of a Nereid feated on a borfe with a fish's tail, they take an

epportunity to justify their studies and pursuits.

Men of a phlegmatic disposition, or of a censorious temper, never cease to rail against those delightful sictions with which Homer and Hesiod, and their poetical imitators, have enriched and embellished their works; but, although these sictions did not contain many useful instructions, and many important truths, would there be any reason to attack and destroy a system which peoples and animates nature, and which makes a solemn temple of the vast universe? These flowers, whose varied and shining beauty you so much admire, are the tears of Aurora. It is the breath of Zephyrus which gently agitates the leaves. The foft murmurs of the waters, are the fighs of the Naïades. A god impels the winds; a god pours out the rivers; grapes are the gift of Bacchus; Ceres presides over the harvest; or-chards are the care of Pomona. Does a shepherd sound his reed on the summit of a mountain, it is Pan who, with his pastoral pipe, returns the amorous lay. When the sportsman's horn rouses the attentive ear, it is Diana armed with her bow and quiver, and more nimble than the stag that she pursues, who takes the diversion of the

chace. The Sun is a god, who, riding on a car of fire, diffuses his light through the world; the stars are so many divinities, who measure with their golden beams the regular progress of time; the Moon presides over the silence of the night, and consoles the world for the absence of her brother. Neptune reigns in the seas, surrounded by the Nereids, who dance to the joyous shells of the Tritons. In the highest heavens is seated Jupiter, the master and father of men and gods. Under his feet roll the Thunders, formed by the Cyclops in the caverns of Lemnos; his smile rejoices Nature, and his nod shakes the foundation of Olympus. Surrounding the throne of their fovezeign, the other divinities quaff the nectar from a cup presented them by the young and beautiful Hebé. In the middle of the bright circle, shines with distinguished lustre the unrivalled beauty of Venus, alone adorned with a splendid girdle, on which the Graces and Sports forever play; and in her hand is a smiling boy, whose power is univerfally acknowledged by Earth and Heaven.-Sweet illusions of the fancy! pleasing errors of the mind! What objects of pity, those cold and insensible hearts who have never felt your charms! And what objects of indignation, those fierce and favage spirits who would de-Rroy a world that has so long been the treasury of the arts; a world, imaginary indeed, but delightful, and whose ideal pleasures are so well fitted to compensate for the real troubles and misery of the world in which we live.

According to the mythology of the Greeks, Death is reprofented by a Cupid with an inverted torch. Upon this pleafing symbol of what, to most men, is a very unpleasing subject, the

Authors observe:

Men fear death, fays Lord Bacon, as children fear darkness. It appears, however, that the ancients could contemplate this melancholy event with a fleady eye and a firm afpect; and whenever they recalled it to their memory, the idea only encouraged them to indulge with more eagerness in pleasures, whose duration seemed far too thort. When they had occasion to mention the last term of life, they never made use of the proper expression, but employed a variety of ci-cumlocutions. Sleep, Night, Repose, are equivalent in ancient authors and inscriptions to the inauspicious term, Death.

Modern artists have not the same delicacy. Subjected to an abfurd and barbarous custom, which owes its origin only to the grossest

ignorance, they always represent Death by a skeleton.

The subject in question is an abstract term, which is employed by convention to denote the cessation of existence. If it is permitted to represent Death by a skeleton, we may with equal propriety repre-

fent Life by a living body; can any thing be more absurd?

We know that the poets have made an allegorical personage of Death; but could sculpture and painting present (which is impossible) so the senses the same ideas which poetry presents to the imagination, is there any thing in the poets to justify painters and sculptors in representing Death by a heap of bones deprived of the muscles which mught to cover them? It is in vain that some artists, in order to disguise, and partly to conceal, the absurdity of such a picture, infold the skeleton in an ample drapery. The extremities are always seen, and never fail to offend the eyes, and shock the understanding.

Death

Death is nothing; the ancients therefore have never personified it; they are fatisfied with expressing it by such images as recal it indirectly to the mind. A Cupid turning downwards a flaming torch : a rose laid on a tomb; these are the symbols under which they delighted to represent it; and nothing could be more proper to diminish

the melancholy of the subject.'

In speaking of a gem on which Cupid is represented in the act of enchaining Psyché, the Authors observe, that the fable of Cupid and Psyché is consecrated in a great number of monuments of the finest ages of Greece. Without mentioning the admirable groupe in the gallery of Florence, or the fuperb cameo in the possession of the Duke of Marlborough, we find the friendship and the quarrels of these imaginary beings represented on a variety of gems as well as bas-reliefs.

' It is remarkable, that before the age of the Antonines, there is not any writer of antiquity, poet, historian, or philosopher, who has thought proper to explain, or even to mention, a subject which had so long and so frequently exercised the genius of artists. Apuleius is the first author who takes notice of this charming fable; Fulgentius, Bishop of Carthage, speaks of it, by his own confession, only after what he had learned from Apuleius, although he says, that a certain Aristophantes had examined the matter at greater length; but of the work of Aristophantes we have not any remains.

This extraordinary filence has given rife to a suspicion, that the fable of Cupid and Psyché was connected with certain mysteries celebrated in honour of the God of Love, in Thespiæ, a town of Bœotia; yet Pausanias, in his literary journey through Greece, says nothing of these mysteries that can justify such a suspicion. Beside, if it was allowable to divulge these religious secrets by statues and pictures. why should it have been forbidden to reveal them by writing?

However that matter may be, it is certain, that Apuleius has not imagined this fable, as some Authors have believed, in order to explain the different systems of philosophers concerning the human soul. The learned Abbé Gori, and other antiquaries, have imagined. that they could explain the emblem as expressive of the union between the foul and body; but this opinion does not agree with the story of Apuleius, in which this union is supposed from the beginning, and in which it is said, that the husband of Psyche is not a mortal. Other learned men, among whom is the Abbe Banier, pretend that the allegory denotes the power of the passions over the mind, and the calamities which this power occasions to mankind; but this explanation does not agree with the unravelling of the fable, which ends in the marriage of Cupid and Psyché, and in the birth of Pleasure, the bappy fruit of their union.

It cannot be disputed that Psyché means the soul. Plutarch tells us, that the word Psyché denoted a certain species of butterfly; and we read in Kesychius that it signifies not only the soul, but a small winged insect. We find, on an ancient monument, a butterfly coming out of the mouth of a man just dead; accompanied by an inscription, published by Gruter: and there is a bas-relief in which Minerva unites a butterfly to the body of a man newly formed. But

although

although it thus evidently appears that the butterfly is an emblem of the foul, how can it be proved, that Love, of which the Greek name Egus, and the Latin name Cupido, equally denote defire, has ever been employed to express the body? In order to discover the true sense of the fable, we shall give an abridgement of the story of Apuleius, which fully explains the several monuments of antiquity relating to this curious subject.

In a certain city, fays Apulcius, lived a King and a Queen, who had three daughters, all beautiful; of the two eldest, however, the beauty had nothing extraordinary, but the charms of the youngest exceeded all description. Some said that the was Venus herself, who, quitting Heaven and the Fortunate Islands, had descended to dwell among men; others, that it was a second Venus, produced in the bosom of the Earth, as the first had been from the soam of the Sea. There were no more voyages to Paphos, Cnidus, or Cythera; the worship of the goddess was neglected; her temples were forsaken; her statues were no more crowned with garlands; nor did her altars smoke with victims. Indignant that a simple mortal should usurp her honours, Venus called her fon, and commanded him to punish the infolent temerity of a virgin, who had abolished her worship, and seduced the admiration of her adorers.

Psyché, meanwhile, derived no advantage from her beauty. Every one was eager to see and to admire her; but she could not inspire love into a fingle breast. Her sisters were already married, while she, alone in the retirement of her palace, was tempted to execrate her charms, which all were ready to praise, but which none defired to enjoy. Afflicted with her melancholy fituation, her parents confulted an Oracle, which ordered them to expose Psyché on the fummit of a rock, adorned with her funeral ornaments; that there she should find a husband, not indeed of mortal race; but a sierce and ungovernable monster, that inspired terror into heaven, earth, hell, and Jupiter himself. Her affrightened parents melt in tears, lament the rigour of destiny, but obey its voice. The trembling and forsaken Psyché abandons herself to all the bitterness of woe; when Zephyrus, railing her with his gentle breath, transports her, on his light wings, into a green valley enamelled with flowers. There she fell asleep. As she awoke, what was her assonishment at finding herfelf in a palace, adorned with the utmost taste and magnificence; and especially, when, without seeing any human form, she heard many voices congratulating her on her arrival, and humbly requesting her commands! The whole palace resounds with celestial music; the most delicate viands and the most exquisite wines are presented to her by invifible hands; the charms of painting delight her eyes; she breathes a perfumed air; all her senses are inchanted with a new, an uncommon, and a continually varying pleasure!

At the approach of night, the beautiful Psyché yields to the neceffity of repose. Scarcely was she asleep, when a voice more soft and melodious than any that she had yet heard, resounded in her ears. A secret trouble seizes her; she knows not what she fears, but she fears the unknown object more than all other calamities. a thousand different thoughts torment the sensibility of her imagina-

clon, her destined husband arrives, softly approaches her couch,

makes her his wife, and before morning disappears.

" Meanwhile, her unhappy parents are consumed with grief; every day her fisters shed their tears at the foot of the rock where she had been exposed, and filled the neighbouring fields with the name of Psyché. Their frequent lamentations, repeated by the echoes around, at length came to her ears. Sensibly affected by them, she thought of nothing but the means of confoling her unhappy family. The agreeable wonders by which she was surrounded, delighted her senses, but could not fatisfy her heart; and the careffes of an unknown hufband could not recompense her for the solitude to which she was condemned. She asked his permission to see and embrace her sisters. At first he rejected her request, which, he had foreseen, would become fatal; yet her tears and her beauty finally prevailed. But while he granted her desire, he exacted a promise, that if her indiscreet sisters should ask who was her husband, she should not acquaint them with the injunction he had laid on her, never to see or know him. Psyche promised; and the same Zephyrus which transported her into

that delightful mansion, brought her fisters thither.

' After mutual and repeated embraces, Psyché made them remark the diftinguished beauty of her palace; dazzled with the lustre of which, they asked who was the husband, or rather the god, who had united in one place all the riches of art and nature. Psyché, faithful to her promise, replied, that it was a handsome youth, whose cheeks were covered with a tender down; but afraid of being betrayed into a more particular conversation, she sent back her sisters, after having made them feveral valuable presents. In a few days, however, they returned, with fentiments very different from those which they had at first felt. To the desire of feeing Psyché, and the joy of having found her, succeeded all the stings of envy. Pretending to share her felicity, they again asked her the name and condition of the husband who united such power and magnificence; and Psyché, who had forgot her first answer, described him by circumstances altogether inconsistent with those which she had at first employed. This mistake convinced them that she had never seen him. They " pitied the cruelty of her fate; wished they could conceal the danger that threatened her; but she herself knew the terrible response of the Qracle." Then they told her, that her husband was a frightful monster, which had the form of a serpent; that his venomous breath insected all the country round; and that, sooner or later, she would be the victim of his ferocity.

Psyché, alarmed and trembling, gave way to the perfidious counsels of her fisters, who promised to bring her a lamp and a dagger,

in order to kill the monster while asleep.

The night meanwhile comes on; and the husband arrives. Psyché estapes from his arms, and, with a dagger in one hand and a lamp in the other, advances with a determined resolution to execute her purpose. But, heavens! what was her surprise, when the light, becoming suddenly more brilliant, discovered to her Cupid himself, lying in the most delightful attitude. She grows pale, her knees shake, she would have pierced her bosom with the steel, but it had already dropped from her trembling hand. The more she contemplates the beautiful object, the more beautiful it seems. His head was covered with flaxen locks, which exhaled a celestial odour, and floated in negligent ringlets over cheeks redder than the rose, and a neck whiter than snow. His shoulders were adorned with light wings, more brilliant than flowers moistened by the dew of the morning. At the foot of the couch were his bow, arrows, and quiver. Psyché considers attentively all these objects, and, inflamed with love, throws herself on her husband, covers him with kiffes, and fears only the moment of his awaking. During these transports of kindness, the lamp inclines, a drop of burning oil falls on the right shoulder of the god, who awakes, exclaims, and slies. The unhappy Psyché has only time to seize his seet, to which she continues suspended, until, her strength and her hopes forfaking her, she falls exhausted on the green bank of a river. Cupid perches on the top of a cypress, and, with a voice rather plaintive than severe, reproaches the credulity of his mistress, her foolish alarms, and, above all, the barbarity of her defign.—He then took his flight; and Psyché, when her eyes could no longer behold him, ran in despair to throw herself into the river, -which, moved by respect for the god whose power extends over all the elements, gently landed her on his flowery bank. There she was received by the god Pan, who endeavoured to footh her diffress, and exhorted her to fosten the resentment of Cupid, by her prayers and tears.

As soon as Venus learned that, instead of punishing the insolent beauty who had provoked her indignation by emulating her charms, Cupid had made her his wife, the enraged mother determined to difarm her son, to break his bow, and to extinguish his flame. His unhappy Psyché became the object of her cruelest persecution; and was daily exposed to new dangers and trials. Capid, fearful that she would at length fink under the weight of her calamities, flies to the throne of Jupiter, faithfully relates his adventure, recites the cruelty of his mother, describes the unparalleled charms of his mis-Ares, and concludes by requesting that he might be solemnly united so her by the indiffoluble ties of marriage. His petition is approved by the affembled gods; and in order to calm the uncafiness of Venus, who was unwilling that her fon should be married to a simple mortal, Psyche is admitted into the number of the divinities. Heaven zings with acclamations; Cupid and Psyché are joined by an eternal union; and the first-fruits of their marriage is a daughter named Pleasure.

We hope that the specimens which we have given of this agreeable work will justify our pronouncing it one of the most ingenious and entertaining performances on the subject of antiquity.

Art. 8. An Essay on Constitutional Liberty: wherein the Necessity of frequent Elections of Parliament is shown to be superseded by the Unity of the Executive Power. 8vo. 1 s. 6 d. Dilly. 1780.

HE principal defign of the Author of this pamphlet is, to dife countenance any schemes for shortening the duration of Parliaments, or any other of those plans of reformation which have been proposed by the County Associations, and to recommend a patient acquiescence in the present system of things. He observes, that the British Constitution has excluded those who make the laws from all share in the execution of them. This arrangement has produced in Britain, effects which frequent elections could never bring about in the ancient republics, because they were not really such. The identity of interest, which is hereby so admirably secured between the people and their representatives, has rendered the interfering of the former, in the common business of Government, much less necessary than it is in republics. This peculiarity of our Constitution has even rendered it immaterial, whether the election of our Parliaments be annual, triennial, or septennial.'

The care which has been taken, in the English Constitution, to keep the legislative and executive powers separate and distinct, has certainly been highly savourable to the liberties of the people; but it by no means follows from thence, that no grievances can arise, which may require the interposition of the people; and should the legislative be corrupted by the executive, it may be absolutely necessary to

revert to the primary principles of the Constitution.

The Writer maintains, that the influence of the Crown may have increased, without any injury to the Conditution. He says, 'if the influence of the Crown has increased since the Revolution, it is not a necessary consequence that it ought to be diminished. Have not the trade, commerce, and manusactures of the kingdom, increased within that period? He also vindicates the House of Peers in their rejection of the Contrador's Bill, because they had a right to do so, 'if

they thought the influence of the Crown was too small.'

One of his principal complaints is, that our modern demagogues atlempt to reconcile things in their nature incompatible. They preach up liberty in all its latitude, but adhere to the present division of property. He thinks, that if the opposition were sincere and consistent, they would be zealous in the promotion of an Agrarian law. He seems also of opinion, that the complaints of the people are not entitled to much regard, unless a decided majority of them join in those complaints; which he does not suppose now to be the case.

Our present parliamentary representation is thought, by this Writer, to be sufficiently complete and comprehensive. Doth not every man in the kingdom (he asks), possessed of a freehold of forty shillings a year, give a vote in the elections? Will any man subs deserven

to be argued with tell me, that this qualification is not comprehensive chough?' We believe that there are many persons in this kingdom, who are at least as impartial as the Writer of this pamphlet, and who deserve full as much to be argued with, who think a more comprehensive plan of parliamentary representation would be a great improvement of the Conflictation. That the present parliamentary representation is inadequate, seems to have been shown in a very forcible and convincing manner, by the late Mr. Burgh, in his Political Disquisitions: but what our Author has advanced upon this subject is very dogmatical, and superficial.

He is dissatisfied with former political Writers of the greatest emimence. Of Mr. Locke he fays, that, ' between his speculations and facts there is frequently little correspondence.' Lord Bolingbroke, he thinks, writes too much like a republican; and Harring:on sometimes uses ' the weakest of all arguments.' He seems solicitous to lead his Readers to this conclusion, that because there always have been abuses in government, therefore these abuses ought to be quietly

Inbmitted to.

He speaks of persons of different sentiments from himself with great contempt; but some of his own notions, and particularly that true liberty cannot be maintained in a State without an Agrarian law, seem to be as Utopian as any of those which he affects to ridicule.

He says, 'this country cannot be impoverished, Ministers cannot touch a halfpenny of the people's money, without the concurrence of Parliament, which implies that the schemes of Ministers are approved by Parliament. He who goes about to tell the nation, that it is impoverished by its Parliament, deserves the notice of neither.' He wishes much for a restoration of 'that considence in our representatives, to which the uniform tenor of their conduct justly entitles them.' He has manifestly a better opinion of our late Parliaments than Sir Fletcher Norton testified a few months since, or than the last House of Commons had even of themselves,—as may fairly be presumed from their famous vote, concerning the influence of the crown.

There is fomething in this pamphlet which gives it the air of elaborateness, and it is not ill-written in point of style; and yet, so far as we can judge, the Author's ideas on the subjects on which he has treated, are far from being accurate, and his arguments are very inconclusive. We are also of opinion, that there is no system of tyranny on earth, which might not be vindicated on principles similar to some of those which are advanced by this Writer.

Art. 9. Corrupt Influence removed, and the Constitution restored; by a new Plan of Election and Representation in one House of Parliament, and a necessary Reform in the other. In Two Letters to the People of England. By the Rev. T. Northcote, Chaplain in the

Royal Artillery. 8vo. 1 s. Almon.
This animated Writer proposes to lay the axe to the root of our political evils; and to cleanse the impure fountains of law and government by removing the very means and instruments of corrupt influence in both Houses of Parliament; by restoring the true principles of the Constitution with short Parliaments and equal representation, in one; and finally annulling the unnatural union of an ecclefiaftical polity

polity with the civil, under one supreme head, who, being the great patron of the church's dignities and emoluments, gains by that means as decided a majority in the other.'

His mode of reforming the representative body of the nation, and procuring us the blessing of an uncorrupt House of Commons, does not differ materially from what has been proposed by the late excellent Mr. Burgh, in the Political Disquisitions; by Major Cartwright, in the People's Barrier; and other political writers, who have been strongly simplessed themselves, and desirous to impress the Public, with the idea, that no relief can reasonably be expected from Parliaments, so long as a majority of the members are more under the influence of the Crown, than of their constituents.

To facilitate the execution of our Author's proposed reformation; he has, in his first letter, sketched out a plan, for which we must refer the Reader to the pamphlet itself; as well as for his bold attempt in the second, to dissolve the inveterate and dangerous alliance between Church and State.

Art. 10. A Letter to the Right Honourable L-d T-w, L-d H-h C-r of E-d, &c. &c. 8vo. 18. Faulder. 1780.

A spirited and severe attack on Administration. After having contrasted the brilliant zera when Mr. Pitt had the direction of the affairs of State, with the politics which have of late tarnished all the glories of the British empire, and involved us in accumulated and fill increasing calamities, the Author takes a view of the great leading characters of Administration—particularly L—d N—h, the E—l of S—h, and L—d G—— G——. The former he compliments for his private and domestic virtues; but taxes him with inactivity and irresolution in his public conduct; and considers him as totally unsit to preside at the helm in a season so peculiarly critical and alarming as the present. To the E—l of S——h he gives no quarter, either in respect to his private or public character. He charges him with gross contradictions, and a want of integrity; and statters himself that no new argument is needed to prove, that the removal of this Minister is devoutly to be wished.

The S—y of S—e for the A—n D—t comes in for a full share of our Author's severity. 'The history of this person (says he) would furnish matter to supply a volume, were it necessary, from the single consideration of a man crushed (as one should have thought) beneath a load of ignomiay, daring to offer, or being suffered to intrude himself upon the nation in a great public character.'

To the councils of such weak and wicked men as these our Author attributes the missortunes an indignant sate bath doomed this country to suffer.

i The only person he judges qualified to rectify the abuses of Administration, and to rescue the nation (if its rescue be indeed possible) from absolute and irrecoverable ruin, is the noble Lord to whom this letter is addressed. His vast abilities, added to his known resolution and undaunted fortitude, render him capable of being of the most essential service to the State, of any member of it. The Author's chief object is, to rouse his Lordship to some bold effort, worthy of the great talents he possesses, and the high office he fills, in order to Rev. Oct. 178c.

remove the prefent Ministers from his Majesty's Councils, and introduce a new lystem of political government, that may restore national

honour and public confidence.

It is somewhat singular, however, that the Author should be so gager to commit 'the ardupus task of reformation' to the very man whose councils have assisted the schemes which Administration hath adopted; and whose perseverance in one line of politics hath arises from that very disposition for which he is complimented by the Author.

Art, II. An Address to the Electors of Great Britain. By one of the People. 8vo. 6 d. Faulder, &c. 1780.

An honest invective against corrupt influence,—parliamentary dependence, &c. attended by a warm exhortation to THE PROPLE to do themselves justice, by the choice of proper representatives.—This account shews, that the present Address appeared before the late General Election; although it chanced not to fall into our bands time enough for insertion in last month's Catalogue.

Art. 12. A Short History of the last Sossion of Parliament, with Remarks. 8vo. 1s. 6d. Almon. 1780.

The adherents of the present Administration will execute this piece, as 'a sactious and inflammatory performance.'—The friends of Opposition will speak of it in other terms. They will pronounce it an animated and just representation of the fatal effects of Government-influence over the representatives of the people in Parliament; and well calculated to rouse the free electors of this country, to a laudable resemment of the unconstitutional measures of a wicked and corzupt Ministry.'—For us, we cannot unreservedly subscribe to either of these accounts. It is, certainly, a following production,—The Author's view in writing it, was the same with that of the patriotic Addresser in the preceding Article.

Art. 13. A Letter to Lord North, on his Re-election into the House of Commons. By a Member of the lare Parliament. 8vo.

1 s. Wilkie. 1780.

Contains a spirited review of the plans and conduct of the Oppofition-party, during the last sitting of Parliament. This review is followed by a very handsome encomium on the abilities, conduct, and character of the noble statesman to whom the letter is addressed.

Art. 14. A Letter to the Right Honourable Viscount Cranberne,
Lord-Lieutenant and Custos Rotulorum of the County of Hert-

ford. 8vo. 6 d. Almon: ~~1780.

Occasioned by Lord Cranborne's Protest against the County Petition. It is sensible and spirited; it merits the serious attention of the nobleman to whom it is immediately addressed, and, indeed, of all who wish well to the true interests of this country.

Art. 15. Letters of Cains, concerning the Times. 8vo. 18.6d.

Macgowan. 1780.

Most of these Letters made their first appearance in a Daily Paper; and their republication, in their present form, is owing to sthe defire of several persons of rank and figure. They are all on positical topics, and written on the side of Opposition. The Author's senti-

Dev (1)

ments, in course, will be applauded in the lump by the Whigs, and damaed by the Tories: -for all is PARTY, now; while PRINCIPLES feem to be-things only to be laughed at.

WAR. AMERICAN

Art. 16. The Narrative of Lieutenant General Sir William Howe, in a Committee of the House of Commons, on the 29th of April, 17-9, relative to his Conduct, during his late Command of the King's Troops in North America: To which are added, Some Observations upon a Pamphlet, entitled, Letters to a Nobleman. 4to. 3 s. Almon, &c. 1780.

The first part of this two fold publication, containing the Evidence produced to the Committee, &c. affords nothing but what hath already been laid before the Public. The fecond part (which is by much the largest) consists of Sir W. Howe's Observations on the Letters to a Nobleman, on the Conduct of the War in the Middle Co-

louies :- See Rev. for Sept. 1779.

In our account of the above-mentioned Letters, &c. we observed, that the accusations brought by that Author against Sir William Howe, were urged with such force of language, and appeared to be so powerfully supported by facts, that we could not help thinking the General's character highly concerned in so bold an impeachment of his conduct. We added, that should neither Sir William nor his friends offer any vindication of his proceedings while as the head of the British army in America, the world would be apt to conftrue such filence into an admission of the charge, &c. &c.

Sir William's vindication, however, now appears; and candour must acknowledge, that it is not a seeble attempt to rescue the General's reputation from the obloquy thrown upon it, not only by the Author of the Letters, but many other writers, who had joined in the ery against the noble Commander.

Mr. Galloway's book (for the Letters are known to be the productions of that Gentleman's pen) is here answered, paragraph by paragraph;

· Mr. Galloway's Evidence before the Committee, and his many publications respecting the flate of affairs in America fince the commencement of the present unhappy war, having drawn his name into a confiderable degree of celebrity, the following particulars respecting this gentleman, as here given by Sir W. Howe, will not be unacceptable to many of our Readers:

Joseph Gallowsy, Esq; (a lawyer by profession) had been formerly Speaker of the Assembly of Pennsylvania. This gentleman, in the beginning of the rebellion, was elected a Member of Congress. When my Brother and I, in the character of his Manifesty's Commissioners for restoring Peace, published a Proclamation of indemnity for all those who had taken part in the rebellion, provided they should surrender themfelves, and subscribe a declaration of allegiance, within a limited time, Mr. Galleway was amongst the first who came over to us, from Philadelphia. This was in the month of December, 3776, when our great successes had intimidated the leaders of the month of December, 2776, when our great interies and instituted in the rebellion, and nearly induced a general fubmifilion. Notwithflanding fo favourable a profeect of affairs, I confidered the acquisition of Mr. Galleway as a matter of some importance, because in all events I expected much affishence from a gentleman of his abilities and reputed influence in the province of Pennsylvania. This expectation will, I hope, in some degree justify my liberality towards him. I allowed him at the rate of 2001, sterling per annum from the time of his joining the army until he could be otherwise provided for. When we had taken possession of Philadelphia, I appointed him a Magistrate of the Police of that city, with a salary made up 3001. X 2

paragraph; and several misrepresentations of important sacts and circumitances seem to be fairly proved on the Letter-writer.— Several other anonymous writers, says Sir William, have made free with my reputation; but of their productions I take no notice, because their assertions, their reasoning, and their scurrility, appear to have been all collected and methodised, in the Letters to a Nobleman. My remarks upon that production have been confined principally to facts: the false reasoning I have sometimes endeavoured to detect; the scurrility I have always passed over in silence. Contempt is the only species of resentment which the venal instruments of calumny deserve; though semething farther may be due to their more insamous employers.

POETICAL.

Art. 17. Love Elegies, by a Sailor, written in the Year 1774. 410. 1 s. 6 d. Wilkie. 1780.

This elegiac bard has endeavoured to form himself upon the model of Mr. Hammond. We are sorry to mortify a sensible and well-meaning man, such as this Writer appears to be, by telling him that, failor-like, he has shewn in this attempt more courage than discretion. Mr. Hammond, though (for the most part) he borrowed his materials, had a manner that was truly original and excellent. His language, of which he had great command, is diffinguishable not only for pathetic simplicity and tenderness, but, when occasion requires it, for nervous dignity and even sublimity: properties by which the present Writer's language can by no means be characterised. His style is too frequently inelegant, diffuse, and seeble.

The Elegics are ten in number, to which are added, two transla-

tions from Propertius.

Propertius is one of the few valuable classics of which we want a translation. Such a work, executed upon the plan of Granger's Tibullus, with Notes, &c. would, no doubt, be esteemed by the Public as an acceptable present.

Art. 18. Female Retaliation. A poetical Essay. By a Man.

410. 6 d. Fielding and Walker.

In the Advertisement prefixed to this little poem, the Author confesses, 'that the greater part of the instances, used in the following Essay, is taken from Mr. Walsh's elegant Desence of Women, written in prose.' And he modestly adds, 'that this short sketch is intended only as a hint of what might be done by a person, who may have

sterling per annum, and fix shillings a day more, for a clerk. I also appointed him Superintendent of the Port, with a salary of twenty shillings a day, making in the whole upwards of 770 l. sterling per annum. Had his popularity, or personal instance in Pennsylvania, been as great as he pretended it was, I should not have thought this money ill bestowed. I at first paid attention to his opinions, and relied upon him for procuring me secret intelligence; but I asterwards found that my considence was misplaced. His ideas I discovered to be visionary, and his intelligence was too frequently either ill sounded, or so much exaggerated, that it would have been unsafet upon it. Having once detected him in sending me a piece of untelligence from a person, who asterwards, upon examination, gave a very different account of the matter, I immediately changed the channel or screet communication, and in future considered Mr. Galloway as a nugatory informer. I continued him, however, in his learning to the superintendent of the Port, in the duties of which I believe he was not deficient.

fewer avocations, and more ingenuity than himsels.' For our part, we think the subject is already in very good hands: ingenuity, at least, does not feem to be wanting in this zealous and manly affertor of the female character.

Art. 19. Sir Ebrius, a Tale for Bachelors. By the Author

of Matrimony, a Tale. 4to. 1 s. 6 d. Payne, &c. We should suppose this dull tale was written by Sir Ebrius himfelf, when he was drunk, or rather during the qualmish intervals of relieving his stomach after an over-night's debauch.

For our account of Matrimony, a Tale (for which this piece is, perhaps, intended as some fort of amende bonourable), see Review for

April, p. 321.

Art. 20. The Rocks of Meillerie: an Epistle from the C-n-s of D-r-y to the D-ke of D-r-t. Written near the Lake of Geneva; with a Preface and Illustrations. 4to. 1s. 6d. Faulder. 1779.

In the preface to this piece are some just observations on the nature of this species of composition. 'The nature of an epistle' (an heroic epille, we presume) ' does not permit the Poet to wanton in description, which ought always to be subordinate to the main defign; and it may be defined, a continued speech, addressing an absent person by an animated apostrophe. The sentiments, though sublime, ought to be natural; the expression, though often enriched by metaphor, should be concise; and where it is the language of passion, it should be interrupted by those broken starts, fine transitions, and delicate revolution of ideas, which require a very able dramatic artist to touch with any great success. He (this relative seems to want an antecedent) must feel with pathos, and must write with elegance,' &c.

How far this Writer, as a Poet, can stand the test of his own rules,

as a Critic, may be seen by the following passage:

See where the dreadful cliff's impending brow Invites my eye to slem the waves below! O sweet Leucate \*, for a Wretch like me Dash my poor brains against thy stormy sea! Yet hold, a moment hold! Eliza think What horror quivers on this awful brink! My latt! my dearest! my last dearest child +! My last! Oh! Heavens; am I frantic wild? Yes, I am frantic wild! come tears of woe, Ye burfling vessels, bid your sluices flow. Never oh! never can I suffer thee. My pretty Innocent, to pine for me,'

La Nouvelle Heloise, Tom. I. Par. 1. Lettre 26. + The Heroine of this Epistle was delivered of a semale child during her residence at Lausanne. :X з

<sup>•</sup> Je n'ai plus qu'un mot à vous dire, ô Julie! vous connoissez l'antique usage du rocher de Leucate, dernier resuge de tant d'amans malheureux. Ce lieu-ci ressemble à bien des egards: La soche est escarpee, l'eau est profonde, & je suis au desespoir.

It will but be justice; however, to acknowledge, that the whole poem is not of this very inferior cast. There are some lines in it. that are tolerable, particularly at the beginning. The Muse, like a person leaping from an eminence, makes an effort at first, but afterwards her progress is rather a descending than a flight. C.t.t.

DRAMATIC. Art. 21. Tony Lumpkin in Town: a Farce. As performed at the Theatre-Royal in the Hay-Market. By J. Keeffe, Author of the Musical Farce, called The Son-in Law. 8vo. 1 s. Cadell.

In the following Prologue, the Manager has anticipated our Review

of this whimfical piece.

If there's a Critic here, who hates what's row, We humbly beg the gentleman would go: He's very welcome to have seen the Play, To take his money back, and walk away. Our Poet is the fearfull'st man on earth, And fears too much four fense may spoil your mirth ; He wishes plain blunt folks, that laugh and cry, As nature prompts, and ask no reason why. To night no Two Att Comedy you'll view, But a mere Farce! the characters not new, And all your old acquaintance: Tony Lampkin, In town, 'tis true, but still a country bempkin. His friend Tim Tickle too, who danc'd the bear; Bruin, the bear himsels-nay, never stare; He shall not hurt you, ladies - keep your places! The bear-leader has given him the gracu-This rustic groupe, bear, bear leader, Squire, Clown, The frolic Muse of Farce now drives to town. Her elder fifter, Comedy, has wit, But Farce has fun, and oft a lucky hit; If the yields laugh, a laugh let none despite; Be merry, if you can, and not too wife.

To this profaceo-poetical account of this farce we have only to add, in justice to the Author, that he has very happily kept up, or rather kept down, the character of Tony Lumpkin, who appears as true and entertaining a rustic in town, as the facetious Goldsmith left him in the country. The same vein of humour runs through the whole The Writer is, it seems, the author of a very popular farce, yet unpublished, called The Son-in-law; and in his present Dedication is very generously lavish of his acknowledgements to Mr. Colman, for contributing to the success of both his little dramas.

Novel. Art. 22. Emma Corbett; or, the Miscries of Civil War: founded on some recent Circumstances which happened in America. By the Author of Liberal Opinions, Pupil of Pleasure, Shenstone Green, &c. 3 Vols. 12mo, 9 s. bound. PRATT and Clinch, Bath; Baldwin, London. 1780.

This Writer (who is known as an Author by the name of Courtney Melmoth, but whose real name we are assured is Pratt) has so often come under our animadversion, that it is now unnecessary for us to enter into a particular examination of his literary character. Of all the productions of his versatile pen, this is perhaps the least exceptionable in sentiment, and the least saulty in composition. And besides this negative kind of merit, which, in a Writer who has so frequently and egregiously offended, ought not to pass unnoticed, this novel has some claim to praise, on account of the variety of interesting incidents which fill up the narrative, and the lively, and sometimes pathetic, manner in which it is related. Without bringing forth to view those features of affectation, and even puerility, which we still observe in this author, particularly in his poetical efforts, we shall not therefore scruple to recommend it as one of the most successful attempts which has been lately made to surnish that kind of entertainment which is commonly sought for from novels.

MATHEMATICS.

Art. 22. The Description of a Sector, for giving the proportionable Sizes of Wheels and Pinions; and for determining the proper Distance of their Cent es from each other. Of great Use to all Clock and Watch-makers. Made and considerably improved, by R. Pennington. 8vo. 1 s. Richardson and Urquhart. 1780. This publication appears to have been made in consequence of the 43d Article of the 68th volume of the Philosophical Transactions for the year 1778, where an instrument is described by a M. Le Cerf, of Geneva, and recommended, by him, for purposes similar to those mentioned in the title page of the pamphlet before us; and of which the title and account was given in p. 44. of our Review for January Iss. Mr. Pennington's instrument appears to be more extensive in its use than M. Le Cerf's; but the truth or falsehood of the principles on which both are constructed, alike depend on mechanical experiments, and can neither be proved or disproved by scientific reasonings.

Art. 24. The Register of Time: or, a perpetual Calendar. By Le Chévalier François Saluces de la Mante, of the Order of Malta.

4to. 2 s. 6 d. Beecroft.

This performance contains the following articles. 1. A perpetual Table to find the Dominical letter for years after Christ. 2. A perpetual Table to find the same thing for years before Christ. 3. A perpetual Table to find the days of the week. 4. A perpetual Table to find the Cycle of the Sun for years after Christ. 5. A perpention of the fame thing for years before Christ. 6. A perpetual Table for finding the Golden Number for years after Christ, 7. A perpetual Table for finding the same for years before Christ. 8. A perpetual Table to find the Cycle of the Roman Indiction for years after Christ. 9. A perpetual Table to find the same for years before Christ. 10. A perpetual Table for finding the Epact for any year in any century after Christ. 11. A perpetual Table for finding the same thing in any Year of any century before Christ. 12. A general Table of Epacts. 13. A perpetual Table for finding the New and Full Moons. 14. A Table of the Parchal Full Moons. 15. A perpetual Table for finding Easter-day. 16. Another Table for finding Easterday. 17. A Table of the Moveable Featts, according to all the pof-fible days that Easter-day can possibly fail on. To these Tables the Ausher has added short accounts of the new Cycles of the Sun and Moon, X 4

arising from the alteration of the Style; and of the Viderian or Dienyfian, and the Julian periods. As also Formulæ for reducing the Old to the New Style.

The Chevalier seems to have brought the dread of the boly Inquisition along with him into England; for even in so trisling a matter as that of forming a supposition (by way of example) that there might have been a year 172293 before Christ; he takes care to add, 'with all due respect to Authorities:' had he been long resident in England, he would have seen, that in such matters we pay no regard to Authorities.

The performance is ingenious, and may be of use. As such, we recommend it to the notice of the curious.

Medical.

Art. 25. Observations on the Theory and Cure of the Venereal Disease. By John Andree, Member of the Corporation of Surgeons of London, and Surgeon to the Magdalen Hospital. 8vo. 3s. Boards. Davis. 1779.

The account we gave of this Writer's Essay on the Gonorrhoa will equally apply to his present performance. It contains little that will be new to an experienced practitioner; yet, as it exhibits the most rational and improved methods of cure in every instance, it may be perused with advantage by those to whom this branch of practice is less familiar. What appears more peculiar to this Author is, an improvement in the manner of treating venereal bubbes. He advises that these should be managed as common abfcesses, and remitted to break of themselves, without the use of either knife or cautic; and he afferts, from experience, the fafety and fuperior advantage of this milder mode of practice. If the Author has occasion to publish a second edition, we would advise him to add Cashat every book, especially one containing much miscellaneous maker, ought to have) a table of contents. He may also perhaps think it expedient to speak in a more guarded manner concerning the use of arsenic, the external and internal application of which he recommends in particular cases, without reserve.

Art. 26. An Address to the Commander in Chief, and Field Officers of the Army. By an old Surgeon. 4to. 6 d. Middle-

The purpose of this Address (consisting of two quotations, one from Dr. Brocklesby, and the other from a writer in the Morning Post) is to shew the expediency of some advance of pay to the regimental surgeons. There seems to be reason enough in what is proposed; but, alas! this will scarcely be thought a time for adding to the expences of Government!

Art. 27. A Letter to a Lady on the Management of the Infant.

8vo. 2 s. Baker and Galabin. 17-9.

Mrs. Sarah Brown, the Authoress of this pamphlet, appears to be an intelligent fort of a body, and most of her directions are rational enough; but we are not to suppose that she puts forth all her strength on this occasion, as one material purpose of this work is to announce

<sup>.</sup> See Review for March 1777.

two other treatises, the subscription for which is one guinea. Mrs. Brown likewise gives advice concerning the nipples, and has invented a bajon, and a machine called the Nurse maid's relief. In short, if the good lady is somewhat of a quack, she is certainly more harmless in that character than the generality of the tribe.

Art. 28. Observations and Remarks, respecting the more effectual Means of Peservation of wounded Seamen and Marines, on Board of his Majesty's Ships, in Time of Action. 8vo. 12. Donaldson, &c. 1780.

Mr. Rymer, the Writer of this little piece, shews the necessity of a number of tourniquets on board of ships in time of action, in order to prevent deaths from hæmorrhage before the surgeon has time to stop them. He recommends for this purpose a tourniquet of his own invention, as an improvement on Petit's. As there seems to be reason in what he says, it is to be wished that a matter in which the lives of many brave men are concerned may meet with due attention, We can say nothing of the merit of bis tourniquet, as he gives no sigure or description of it.

## MILITARY.

AR. 29. Patriotic and Military Instructions. Addressed to the People of England, with a View to enable them to deseat the Purposes of the Enemy, in case of an Invasion of any of the Possessions of his Majesty. Preceded by some new Observations relative to Fortification, submitted to the Judgment of Engineers, and of those who cultivate the Military Science. By a Citizen of the World. 12mo. 3s. Faulder. 1780.

World. 12mo. 3s. Faulder. 1780.
This performance is divided into five chapters: in the first, the Author combats an opinion which, be says, prevails in England, that the art of fortifying places is of no use here.

In the second, he endeavours to convince us of the intentions of France and Spain to invade England, and to set forth the consequences that must result from such a circumstance, if the country people are not thought how to fortify themselves in such a manner as to resist them.

In the third, he opens his new views of fortification—gives directions for conftructing forts, and for defending them—not by cannon, but by means of a new catapule, which he has invented, and which is capable, he says, of producing much greater effects than can be produced by cannon.

The fourth contains general instructions for repulsing the enemy in case of an invasion. Here he directs the country people in the making of an abbatis, intrenchments, the flanking them, the making of sascines, wells, palisades, and all the modes of fortification which the country people may be supposed capable of putting in practice.

In the last chapter, he gives instructions for fortifying a plain country, narrow passes, inns, private houses, small towns and villages, and for forming ambuscades and stratagems for the destruction of the invaders.

The book appears to be written by a foreigner; or at least by some person so little acquainted with the English language, that, in many places, it stems impossible to understand him.

M 1 5-

## MISCELLANEOUS.

Art. 30. History and Amours of Rhodope. 4to. 2 s. 6 d. Diemar. 1780.

Mr. Diemar is publishing, by subscription, two engravings, from paintings of Angelica Kaussman, by Bartolozzi. The subject of one piece is, 'The Loves of Rhodope and Æsopus;' of the other, 'Plammetichus, King of Ægypt, chusing Rhodope for his Queen.' The Publisher, fearing that 'the history of Rhodope might either be everlooked by many, or forgotten by others; has thought it necessary to instruct the one part, and to refresh the memory of the other, by a short recital of the history and amours of Rhodope. Herodotus, Diodorus Siculus, Plutarch, Ovid, Suidas, and others, gave the materials for this history; the putting of the materials together, and embellishing the whole by poetical siction and episodes, has fallen to the share of the Author.' If this little tale answer its Author's intention in making the subject of the engravings known and familiar, we apprehend it is all that he will expect from it. Prefixed to this publication is a very elegant frontispiece, from a design of Angelica Kaussmann's, engraved by Delatre.

Art. 31. A new and complete Interest Book, exhibiting the Interest of any Sum of Money from 5 s. to 1000 l. at any Rate from a Quarter to 5 per Cent. and for any Time from one Day to one Year. Carefully calculated to a Farthing. To which are added, Tables of Annuities, Reversions, Compound-Interest; Portugal Money; and Expences, Income or Wages. Ey William Simpson.

12mo. 28. 6 d. Lowndes. 1780.

We have not the leaft doubt but that this book will be found very infeful to all bankers, merchants, brokers, attorneys, flewards, auctioneers, and all other persons who are any ways concerned in calculations relative to interest, brokerage, commission, or wages: and it appears to us, as far as we have had an opportunity of examining it, to be very carefully printed.

TRACES relative to Popery, &c.

Att. 32. A free Address to those who bave petitioned for the Repeal of the late Ad of Parliament in Favour of the Roman Catholics. By a Lover of Peace and Truth. 8vo. 2d. Johnson. 1780.

This little Pamphlet contains a ferious remonstrance with our too mealous associators for opposing Popery, by methods inconsistent with the spirit of Christianity, and sepugnant to the real honour and interest of Protestantism. The Author thinks their opposition was as impolitic in a civil, as it was unchristian in a religious view. Independent (says he) of the peculiar spirit of Christianity, which the best of us are too apt to lose sight of, let us consider our conduct as that of men to men, who have equal zeal for their respective tenets, and may have equal power. Can we coerce others, without vindicating those who coerce us—without setting them an example, and therefore, in fact, urging them to proceed in the same manner? Though the power of the Papists be happily at an end in this country, it subsists in full force abroad, and in countries where there are Protestants. And in several countries where the Government is Popish,

there are more Protestants than there are Papists here. If then you would know how you should behave to Papists here, the answer is obvious, viz. in the very same manner in which you would have Papists behave to Protestants abroad. You should show the savour you wish to receive, and forbear as you wish to be forborne with yourselves!

These are plain reasonings, obvious to the weakest capacity, and perfectly adapted to the benevolent design of this little Tract, which is chiefly calculated for the unlettered tribe,—under which description the Author, we suppose, classed the general body of the Protestant

Affociation.

This candid and well-timed Pamphlet is attributed to the celebrated Dr. Priefley. It bears firong marks of that freedom, simplicity, and perspicuity which are the known characteristics of his popular Tracts: for though his talents are best adapted to the higher spheres of learning and philosophy, yet he knows how to condefeend to men of low degree, and can answer sools according to their folly, without becoming like one of them.

Art. 33. A Defence of the Protestant Association, and others. In

two Letters. 8vo. 6d. Kearsley. 1780.

The Author calls himself a Man of Ross. We should sooner think him a Man of Straw, set up in ridicule by some sty rogue of a Papist, in order to expose the cause it professed to vindicate.

RELIGIOUS.

Art. 34. The Refloration of all Things: Or, a Vindication of Jee Volthe Goodness and Grace of God, to be manifested at last, in the Recovery of his whole Creation out of their Fall. By Jeremiab White, Chaplain to Oliver Cromwell. The third Edition. With an additional Preface; containing Quotations from divers other Authors, not mentioned in the first Preface, who have wrote in Confirmation of the above Dockrine. 8vo. 3s. sewed. Donis

and Son. 1779. The doctrine of the proper eternity of suture punishment, is so repugnant to all our ideas of the equity and goodness of the great Moral Governor of the world, that it is no wonder it should have been called in question, by some free and generous spirits, in almost every age, and of almost every party among Christians. Among others, in the last century, the Author of this Treatise, a man of confiderable learning and ingenuity, and of a forightly and liberal turn of mind, found himself unable to reconcile the common opinion on the subject, with the representations and declarations of the scriptures respecting the essential goodness of God, and his love and kindness toward men. This led him to adopt the scheme of the Restoration or Restitution of all Things: which, in the Work before us, he proposes to support and illustrate upon the ground of Hely Scripture, and in confistency with the Calvinistic doctrine of Election and Reprobation; a doctrine, that, in his opinion, stands in need of such an hypothesis to salve its harshness, and to render it consistent with the grace and

The first edition of this Treatise, as we learn from the additional Presace, was printed in 1712, sive years after the death of the Author, without his name. The Editor of the present edition has

:opied

goodness of God.

copied, in his Preface, two articles relating to Jeremiah White, from Calamy's Account of the Ejeded Ministers in 1562; to which we refer those of our Readers, who with to be acquainted with his general history and character. He has likewise given us several quotations from different writers, in favour of the doctrine of universal Restoration, in addition to those which are inserted in the Presace to the fant edition. The authors from whom he quotes are, Richard Cop-pin, William Erbury, and two anonymous writers in the last century, and Dr. Cheyne and Dr. Burnet of the Charter-House in the present. To these he has added two modern mystical Divines, William Law, and Richard Clarke. He ought, in justice to his Author, and for the credit of his scheme, to have noticed two other modern writers, who have argued with great ability and fuccess, in savour of the sucure restoration of the whole human race to virtue and happiness: We mean, the late Mr. Tucker , in his Light of Nature pursued; and Dr. Hartley, in his Observations on Afan: not to mention any living writers, who have advanced the fame opinion.

With respect to the Treatise itself, we cannot say much in its commendation. The sentiments are Calvinistical: the style is verbose, swelling, and affected; and the reasonings, for the greater part, are intricate, abstract, and mystical. The Author argues from texts of scripture, which, in our opinion, have no reference to the Subject; such as, 1 Tim. ii. 3—6. 1 Pet. iii. 18, 19, 20. and Rev. x. 1—6; and hurts his cause by his injudicious method of supporting it. But though we cannot approve of the sentiments, language, or reasoning of this Treatise, or think it can be agreeable to the improved judgment and talle of the present age, we are difposed to give full credit to the pious and benevolent professions and intentions of the Author and Editor; and readily join with the latter in reprobating the thought, that the all powerful, wife, and bene-Acent Creator could defignedly bring into existence, millions of beings to be in pains and agonies to all Eternity.

Art. 35. Christian Catholicism defended: In some Remarks on a Letter to the Rev. Benjamin Fawcett, M. A. occasioned by his Candid Reflections, &c. concerning the Trinity. In five Letters to the anonymous Author. 8vo. 1 s. Buckland. 1780.

This Pamphlet, we are told, was drawn up on the supposition that Mr. Fawcett intended to make no reply to the above-mentioned Letter; and under an apprehension that some remarks were of importance to that Writer's character, as well as his cause; and that those of an impartial by-stander might be attended with some peculiar advantage. The account which the Author gives of himfelf is in the following terms: ' He is neither Arian, Socinian, nor Sabellian: he is by no means partial to those who are so denominated, nor does he admire the strain of preaching which is common to them, but gives the preference to those who approach the nearest to our old Puritanical divines. His principal connexions are with such, and he defires to preserve them: at the same time that he thinks their charity too much confined; and wishes to show them, that they are mis-

<sup>\*</sup> Who appeared in print, under the assumed name of SEARCH.

taken is supposing that the doctrinal fentiments of others are fundamentally erroneous, either with respect to the object of worship, or the method of acceptance. He thinks the strongest objections to them are of a very different nature: that those objections, however, are not peculiar to them, and are far from being universal; that both parties, if they were properly disposed, might compromise the differences which subsist between them, and unite in promoting the common cause; but that even without such union, they are both useful in their different ways, and among the different persons with whom they are connected.

It is further added, concerning the Author of these Letters, 'that though he is not a stranger to Mr. Fawcett, he believes that gentleman is, to this hour, unacquainted with the present design; which was undertaken, not so much from any partiality to bim, as to the

cause in which he has embarked.'

The above declarations are candid and catholic; and the Letters appear to be written in conformity to them: though some readers may possibly think the Author too severe on his antagonist.

Art. 36. The Passion; or, a descriptive and critical Narrative of the Incidents, as they occurred, on each Day of the Week, in which Christ's Sufferings are commemorated: with Reslections calculated for religious Improvement. By Thomas Knowles, D. D. Prebendary of Ely. 12mo. 3s. L. Davis. 1780. The nature of this publication is sufficiently explained by its title-

The nature of this publication is sufficiently explained by its titlepage. The Commentators that have been principally consulted by this Writer, either for settling the harmony of the Evangelists, or illustrating such passages as were doubtful, are, Whitby, Doddridge, Lightsoot, and Benson.

There seems to be little to recommend this orthodox system of mechanical devotion, besides the piety of the intention with which the Author prosesses it to have been composed.

## SERMONS.

I. Preached in the Parish Church of Rotheram, before the Most Worshipful Grand Master of the Most Ancient Grand Lodge of all England, his Officers, and the newly constituted Rotheram Druidical Lodge of Free and Accepted Masons, Dec. 22, 1778. By the Rev. Brother John Parker, G. Chaplain, Vicar of St. Helen's in York. Published at the Request of the Grand Master and the rest of the Brethren. 400. 1s. York printed. 1770.

of the Brethren. 4to. 1 s. York printed. 1779.

Mr. Parker, with great zeal, pleads for the antiquity and excellence of the Free Mason fraternity. He traces it to the Land of Cannaan, and of Egypt: he reckons Abraham, Moses, Elijah, John the Baptist, the three Wise men from the East, &c. &c. among the number. He appears to wish and hope, that some in the present day will be persuaded to unite themselves with this samous brotherhood; and he addresses some wholesome exhortations to those who are already of the band.

11. Preached at St. Martin's Church, Coney-Street, York, December 28, 1778, before the Fraternity of the Provincial Grand Lodge of the Molt Ancient and Honourable Society of Free and Accepted Majons

\_\_\_

Masons of the County of York, and published at their Request. By the Rev. William Johnson, P. G. C. Curate of St. Mary's, Castle-gate, and St. Olave's in Mary-gate. 4to.

printed. 1779.

This Discourse, preached a few days after the former, defends, as that does, the cause of Free-Masonry, and speaks of it in the most honourable manner. 'I may venture, Mr. Johnson says, with great propriety, to style Masonry the Centre of Unity.' He mentions this particularly on account of 'some punctilios and modes of worship,' in which, he observes, the members of this society may differ; 'yet these matters, he adds, are easily adjusted, by the judicious and admirable institutions and regulations of the Lodge.' Piety, justice, benevolence, every virtue, according to this Writer, are inculcated and promoted by Free Masonry. In short, it is said, even our apparatus and our jewels are admonitory. The white apron is an emblem of inmocence. The square points out to us the duty of squaring all our actions by the rules of justice, without partiality. The compasses direct us to circumscribe all our desires within the bounds of propriety and moderation. Our implements and ornaments have not been adopted by whim and caprice; but are all emblematic, fuggesting to us the practice of some useful and substantial virtue."
Let us endeavour, says he, in the close of the discourse, by our upright conduct, to convince the world that we are good men and true; that piety towards God, and unfeigned love for each other, are the two grand points of our aim; that we have formed our plan on the perfect model of God's will, as it is revealed to us in the facred volume; the natural refult of which will be, that we shall put to filence the ignorant and ill-natured suggestions of soolish men, and shall attract the esteem of the good and virtuous.' These are good exhortations; how far Masonry tends peculiarly to advance their obfervance, we know not.

### CORRESPONDENCE.

The following Letter comes from an occasional, and very respectable, Correspondent, to whom we are under too many obligations to admit of a moment's helitation with respect to its insertion; at to the charge of inadvertency, here brought against us, we leave it to the judgment of our Readers.

TINDER impressions of great respect for your judgment, and a high opinion of your candour, I now address you, to recal your attention to an Article in your Review 53, for July.

As fincere and enlightened friends to the liberty of your country, it certainly is your wish to promote, at this melancholy period, a careful investigation of every rational plan for restoring our shattered constitution. I am sure you agree with me in chinking, that a plan for fo great an undertaking, provided it be complete and unexceptionable in the main points, ought not to be left unattempted, because of trivial omis-Sons which any hand might supply; much less, on the supposition of defects which had no existence. I refer to the plan of Major Cartwright for refloring annual Par-Framents, and a true representation of the people, as given in The People's Barrier

against undue Instance and Corruption; reviewed in page 53.

I trust, Gentlemen, you will take no offence, if I offer it as my opinion, that your judgment on that publication was delivered somewhat inadvertently. The bare eading of the Article itself has probably made the same impression upon the minds of others who never read the book; because that judgment is expressed in terms not exsally corsespondent to your own provious recital of the matter and ments of the work. There you lay, the Author " fablifes the natural right of the people to a voice in the election of their representatives," and that " be feess, that those acts which inproduced firft triennial and afterwards feptennial parliaments, were fundamental wielations of the Constitution:" so that I was surprised when you afterwards declared your

doubts on the expediency of refloring annual parliaments.

The objections which you supposed might be suggested, were,

T. The "danger left this important trust should fall into the hands of men of low education and inferior abilities; fince it is not to be expected, that a sufficient number of gentlemen of independent fortunes, and adequate accomplishments, would think a feat in Parliament for a fingle fefflon an object worthy of their attention.

" 2. If on an annual election there were frequent changes, the nation would perhaps be kept in a frate of continual ferment; and the greater part of the House of

Commons might be at all times unexperienced in parliamentary bufinefa-

" 3. If changes were not frequent, -if public tranquillity and a general spirit of inattention to national concerns, should give the same persons a feat in Parliament fer several successive festions, they would soon become liable to all that undue influence at present so justly complained of."

Surely, Gentlemen, these two or three if--ahen weighed against a digasted and comprehensive plan for restoring our lost freedom, and saving our finking country, must be lighter than a feather in the scales of sober judgment and sound season! But every one of these objections the Author was so well aware of, that, as occasion offered, he has shewn their total want of foundation. Such passages as my memory enabled me to turn to, I refer to in the margin \*. Lying interspersed with the other far more important arguments, in writings of considerable length, I am not however surprised

that they should have escaped your recollection.

In reply to the first supposition, it may be asked, whether, in the present flate of thingen a candidate's education or abilities make in general any part of his recommendation to a feat in Parliament? And would they not, provided the reform had taken place, meref-farily be among the principal recommendations of every candidate? Whether merits would not be more confidered when the law-makers should be chofen by, than now that they are imposed upon, the People, will scarcely bear reasoning upon. value which the accomplished gentleman might fet on a feat in Parliament for a fingle feffion, it would, I apprehend, be precifely in proportion to his public fairit and pre-bity. But the men who do now cover those seats, and would deline them in annual and uncorrupt Parliaments, are the very men whom it is the object of this plan to ex-clude, he their birth, fortunes or accomplishments what they may. Beside which, through an excess, as I think, of caution, it provides against the possibility of wanting proper representatives, by an exertion of those powers of the Constitution which anciently proved effectual, and which in various other inflances are fill resorted to.

As to the first part of the second supposition, a mature confidention of THE WHOLE OF THE PLAN TAREN TOGETHER, including in particular parochial elections by ballet, and the eradicating of election bribery which is the cause of turnalt, as well separliamentary corruption, which gives rife to all violent contention for feats, must, as it appears to me, convince every candid mind, that if it were carried into execution, election ferments would no longer produce the smallest inconvenience in the state.-The second part of this supposition can need no resutation, unless we are to imagine, that, to be free necessarily implies to be foolifs: for I know not on what principle it can be supposed, that when the people (being really free) want good laws, they should appoint school boys or notorious novices to make them. Admitting however the fact, improbable as it is; their feelings would in due time teach them wildom, and, being free, they would then correct the error. At present they are not free, being not renton lented; and, as a Parliament which does not depend on them will not redress their grievances, so they have evidently no conflitutional means of redressing themselves, but those which no lover of peace would have recourse to without the greatest resuctance.

<sup>\*</sup> See The People's Barrier, p. iv. of the Introduction, and p. x. of the Pr-faterry Address. See also p. 38, 71, 109, Art. LVI, 110, 117 Q, 122 EE: and The Legiflative Rights of the Commonally windicasted; p. 386, xv. xvi. xxiv. of the Introduction. See also p. 23, 24, 45, 66, 68, 92, 94, 99, 100, 104, 142, 158, 15c, 165. 163, 227, 229. See also Corrupt Influence removed, p. 9, 10, 16; and Hift Effey on the English Conflitution, p. 149. Now

Now, with regard to the third supposition, which stands upon ground opposite to the second, I scarcely know whether, after what has been faid, it needs any reply. 'Tis a fingular dilemma, Gentlemen, into which you feem to have brought yourselves, by fuggesting that the plan might be productive of frequent changes, and might not be roductive of frequent changes, and for either of those reasons would be defective. This is placing it between two fires with a witness; but as the Major has fortified it tolerably well, and these batteries are opposite to each other, possibly they may silence one another without doing the smallest injury to the plan. Be it, however, admitted, that men long kept in Parliament by annual re-elections for their merit alone, might become "liable" to influence: what then?—Why, no minifer would attempt to exercise that influence over them, and for this plain reason: The act itself would deftroy the cause of every former election, and render it highly improbable they should succeed in another : at least so very precarious, that no such men could be worth purchafing. The very idea of purchafing a majority of a Parliament fo circumflanced, is extravagant to the highest degree. Every well informed and candid mind must, I think, pronounce it impracticable. Notwithstanding this too, let it, for argument fake, be also admitted, that, through the infensibility of the people, their representatives, by not being frequently changes, should be corrupted; and still it will surnish no objection to this plan; but the contrary; for the instant that, either in the shape of taxes or of arbitrary controul, it should recal them to their feeling, they would necesfarily correct the evil; because by the operation of this plan they would have the power so to do, whenever they thought proper to exert that power.

But now that I have vindicated Major Cartwright's plan from ideal impersections, I will also act the part of a candid Reviewer, and point out two real defects. 1. He hath not provided that every member of his reformed parliament shall be returned by more than balf of the electors; notwithstanding he lays it down as a principle, and very justly, that without such an election no man can be the true representative of any elective body. And, 2d, The proposed regulation in Article XXIX. p. 102, is evidently inconfissent with this principle. As it was elsewhere provided, that only one member should be chosen by any one elective body; so here, care should have been taken, that in case there were three or more candidates, whereby the most favoured candidate might have a number of votes les than half of the gross number polled, such moß favoured candidate thould not as yet be deemed duly elected. But, in order to make the election final, those two candidates who had the greatest number of suf-frages in their favour, should now be put up over again by themselves, and a new election between them alone take place. This, it is probable from the plan under our consideration, would happen but seldom; but whenever it did happen, the repetition of the ceremony would occasion little trouble, but must prove decisive, and would give the elective body a representative according to the true principles of representation. I conceive there are no other equitable means of getting out of the difficulty,

If you will indulge me, Gentlemen, with the publication of these remarks, for the length of which I hope the importance of the subject will be a sufficient apology, you will greatly oblige your admirer,

ALFRED.

- P. S. The Objections of "One of our ablest and most independent Senators" against triennial Parliaments, with which your strictures are closed, do not in the smallest degree apply to annual Parliaments, when elected and guarded as proposed by the plan: for a proof of which I refer you to p. 126.
- \* The Conclusion of the Life of Garrick, by Mr. Davies, is necessarily postponed to our next.

ART. I. Madan's THELYPHTHORA; or, Treatife on Female Ruin, &c. Continued: - See last Month's Review.

HIS reverend Author, in an Advertisement prefixed to his Treatise, assures his Readers, that he doth not scruple to call it one of the most interesting publications that have appeared since the days of the Protestant Reformation.

The emancipating priests from the bondage and hazard of celibacy, was a bold effort of Luther; and as he himself was among the first who gave the example of marriage to churchmen, the heroism of his conduct, in so singular an enterprize, added force and credit to the freedom of his principles. Madan adverts, with some degree of exultation, to this notable circumstance; and observes, that the marriage of priests was as Arange, and deemed as criminal an action, in our own country. formerly, as polygamy would be at present, were it to be restored to its ancient honour, and established by the legislative authoon the priesthood, and monogamy on the laity, as issuing from the same polluted source of anti-christian tyranny and superstition: and pushing the liberty of the gospel beyond the bounds which even Luther had prescribed to it, he boldly steps forward to complete what the Reformation had but partially effected; and pleading the sanctity of his intentions, and confiding in the goodness of his cause, he cheerfully leaves the event of his researches, and the success of his endeavours, to the bleffing of Providence!

Mr. Madan, indeed, is not the first Protestant writer who hath stood forth the champion of polygamy on the holy ground Yor, LXIII.

of Scripture. Bernardinus Ochinus had the honour of freceding him in this truly redoubtable enterprize. With a zeal as ardent, and ends as Quixotic, as our hero's, he waged war with custom, and nobly burst through the prescriptions of authority. And to enhance the merit of this enterprize, and our admiration of the man who was daring enough to undertake it, Bernardinus Ochinus, at the time he elained the patriarchal privilege of MANY wives, was past his grand climacteric, by more than a dozen years!

From a sketch of his arguments, produced by the learned Frederic Spanbeim, Prosessor of Divinity at Geneva (1638), in his Dubia Evangelica [Par. 3. Dub. 122.], it appears that he had pre-occupied Mr. Madan's ground, and fortified it by the same texts of Scripture, and by a similar train of reasoning.

\* This truly learned and most ingenious man was General of the Order of Capucins: an eloquent and distinguished preacher; and much courted and careffed by the Great on account of his extraordinary accomplishments. At the Reformation he joined the Protestants, and lest Italy, with Peter Martyr, about the year 1543. He affumed a secular habit, and married a lady of Lucca. The connection, it is faid, proved unfortunate; and it was supposed, by some, that he wrote in vindication of polygamy, in consequence of the disappointment and mortification which he received from the gallantries of his The severe Doctors of the Helvetic church never made charity a fundamental article of their creed: and without sympathising with his misfortunes, they proceeded to damn his principles. They were not accustomed to seek for candid apologies in the infirmities of age, or the chagrin which arifeth from ill treatment; but finding him in an error, they applied the common argument of bitter zeal to correct The method they took with poor Ochinus was short, but irrefishible; for they banished him at once from their Church and State, as the best method to preserve the peace and purity of both. The Socinian church in Poland being at that time a kind of common refervoir of herely, opened its wide gate to our fugitive, and afforded him some little protection from Calvinistic inquisition. But as one error frequently generates another, this learned man became obnoxious to the Polonian bretbren; and at last funk into a species of herely which the charity of Socinianism itself could not tolerate.

Maldonatus attempts, in his Comment. on Matth. xix. to throw fonce obloquy upon the Calviuits, because one of their sect had publicly vindicated the practice of polygamy. Rivet (Prosessor of Divinity at Poictiers in 1633) combats this reslection of the insidious Jesuit, with true Calvinistic bitterness, and observes—" Scimus suitle excurulatum Capucinum qui ex Papismo ad nos transiit, et ad Samosatenianos deficit, qui, tales Dialogos conscripsit, quales se vidisso prontetur Maldonatus. Is suit Bernard. Ochinus, qui à nullis during suit exceptus quam a nostres." Exercit in Genesin, pag. 130.

N. B. Ochinus's Dialogues on Polygamy were answered by Theo-

dore Beza.

Our Author mentions a book, published about the conclusion of the last century, entitled Polygamia triumphatrix; but says not a word (if our recollection serves us aright) about the Dialogues of Ochinus. Was it that, from his avowed and most implacable hatred of Socinianism, he omitted to quote a precedent from the abettors of that heresy? Or was he ignorant that his darling subject had been discussed by a writer whose genius and erudition had long made him the envy and admiration of opposing sects? From his extensive reading, we can scarcely think the latter to be the case: and from his repeated prosessions of candour and free-thinking, we should be forry to charge his omission to the account of his bigotry.

In our last month's Review of this Treatife, we presented the Reader with a brief and general account of the subjects that are more minutely discussed in it; and particularly entered into an examination of the Author's doctrine of marriage; which may, indeed, be considered as the corner-stone of this singular sabric.

We shall now attend to the capital object of this ill-planned work; and though it would be inconsistent with the nature and limits of our Journal to pursue the Author through every devious track, into which his deating passion for polygamy bath betrayed him; yet we think it our duty to give a fair and impartial view of his argument, together with those authorities from Holy Writ, on which the support of it is principally sounded.

By polygamy (says Mr. Madan) I would be understood to mean, what the word literally imports, the having and cohabiting with more than one wife at a time. Whether taken together, as seems to be the case of King Jehoash, 2 Chron. xxiv. 3. or first one and then another, as Jacob, Gen. xxiv. 28. or David, I Sam. xxv. 43. it was this which was allowed of God, conse-

quently practifed by his people.'

In defence of this practice, the Author observes (vol. i. 108), that is the best and fairest, and indeed only way to get at the truth on this, as on every other occasion, where religion is concerned, is to lay aside prejudice, from whatever quarter it may be derived, and to let the Bible speak for itself. Then we shall see, that polygamy, notwithstanding the Seventh commandment, was allowed by God bimself; who, however others might mistake it, must infallibly know his own mind, and thoroughly understand his own law. If he did not intend to allow polygamy, but to prevent or condemn it, either by the Seventh commandment or by some other law, how is it possible that he should make laws for its regulation, any more than for the regulation of thess or murder? How is it conceivable that he should give

Written by the miserable John Lycerus, a clergyman of the Danish church;—whose polygamous frenzy, first checked by the State, at last expired with himself—in a garret!—Blissed martyr, verily!

the least countenance to it, or so express his approbation of it, as even to work miracles in the support of it? For the making a woman fruitful who was naturally barren, must have been the effect of supernatural power. He blessed, and in a particular manner owned the issue, and declared it legitimate to all intents and purposes. If this be not allowance, what is? As to the first, namely, his making laws for the regulation of polygamy, let us consider what is written, Exod. xxi. 10. If he (i. c. the husband) take him another wife (not—in so doing he sins against the 7th commandment, recorded in the preceding chapter—but), her food, her raiment (i. c. of the first wise), and her duty of marriage, he shall not diminish.

- There is (says our Author, p. 112.) a passage which is express to the point, and amounts to a demonstration of God's allowance of polygamy, Deut. xxi. 15. "If a man have Two WIVES, one beloved and another bated, and they have borne him children, both the beloved and the hated; and if the first-born be her's that was hated, then it shall be, when he maketh his fors to inherit that which he hath, that he may not make the fon of the beloved first-born before the son of the hated, which is indeed the Arst-born, by giving him a double portion of all that he hath, for he is the beginning of his ftrength, and the right of the first-born is his." On the footing of this law, the marriage of both women is equally lawful. God calls them both wives; and he cannot be mistaken. If he calls them so, they certainly ever fo. If the second wife bore the first son, that son was to inherit before a fon born afterwards of the first wife. Here the issue is expressly deemed legitimate, and inheritable to she double portion of the first-born, which could not be, if the fecond marriage were not deemed as lawful and valid as the first.
- To fay that Polygamy is finful (for if it ever was, it certainly is, and if it ever was not, it certainly is not, unless some positive law hath made an alteration; or unless good and evil change their nature by length of time, like the fashion of our clothes) is to make God the author of sin; for not to forbid that which is evil, but even to countenance and promote it, is being so far the author of it, and accessary to it in the highest degree.'
- The above text, of which Mr. Madan makes such a triimphant boast, doth not contain an explicit declaration of the sawfulness of polygamy. At the utmost, it only presupposes that the practice might have existence among so hard-hearted and fickle a people as the Jews. It therefore wisely provides against some of its more unjust and pernicious consequences:—particularly, those which tended to affect the rights and privileges of heirship. Our Author's inserence, that because laws were made

to regulate it, therefore the practice of it was lawful, is a mere fallacy; and not only so, but entirely overthrows some of his own arguments. For instance, laws were made to regulate divorce—that corrupt species of divorce, which, as our Lord observes, was only "suffered by Moses on account of the bardness of the hearts" of the people of Israel: and even Mr. Madan pleads strongly for the absolute malawfulness of all divorces whatsoever, unless in cases of adultery.—Here, then, his own

reasoning is sull and explicit against himself.

But it remains to be proved, that 'this text amounts to a demonstration (as Mr. M. avers it to be) of God's allowance of polygamy.' It is infinitely more probable, that the "hated wife" had been dismissed by a bill of divorcement, than that she was retained by her husband; especially since a divorce was so easily procured, when aversion and disagreement subsisted between the parties. But in this case, the right heir, or the first-born, was still to affert his claim to the inheritance that was allotted him by law, as much as if no divorce had taken place, and his mother had retained the affections of his father. A second samily, from a woman more beloved, was not to encroach on his right: nor could his father deprive him of a tittle of it. This provision was a very wife and equitable one; for though Moses could not prevent, he did every thing to lessen, the evils of divorce.

We would farther remark, that for any thing that clearly appears to the contrary, the two wives, so far from living with the same husband at the same time, may be supposed to be dead; for the words may be rendered thus, "If there should have been to a man two wives, one beloved and the other hated, &c. &c. Thus the text is rendered by Mr. Madan's sum Mone

tanus. Cum fuerint viro due uxores, &c.

In supporting the doctrine of Polygamy on the authority sven of the Old Testament, the Author hath some considerable difficulties to struggle with. The remarkable words which so fully express the designation and limits of the original institution of marriage, as delivered by God himself to our sirst parents [Gen. ii. 24.], and restored to their primitive and unadulerated meaning by Jesus Christ [Matth. xix. 4, 5. 8.], create no little trouble for our zealous Polygamist. He applies them (together with another remarkable text in Mal. ii. 14, 15.) solely to the doctrine of divorce; and combats with much earnestness, but little argument, the opinions of those commentators who would deduce a prohibition of polygamy from them. In this contention he is reduced to the lowest of fallacies, and attempts to support the credit of his cause by a quibble that would disgrace even Westminster-hall; while by artifices like these, to which he is

driven in order to evade the letter of the text, he plainly discovers how much he feels the force of the objection which ariseth from it. It is said in Genesis,—" And THEY shall be one sless." Our Saviour, in quoting this expression, is still more explicit in applying it to the marriage of one man and one woman:—" And they TWAIN shall be one sless." Now what says Mr. Madan to this decisive and positive declaration? Decifive?—that he denies;—and then slies to this pitiful hold of chicane.—" It is not said, they two only—or none besides the twain—shall become one sless."—" There are no such words (says our acute casuist) as " two only" in the law of marriage. Hence, on our Author's hypothesis, the number is not definite, or limited in any degree whatever. A man may marry as many wives as he pleases, and by marriage he becomes one sless with ALL of them!

On Mr. Madan's interpretation, the whole force of our Saviour's reasoning is entirely lost. His words are these: "Have ye not read, that he which made them at the beginning, made them male and semale? and said, For this cause shall a man leave father and mother, and shall cleave to his wise (not wives), and they TWAIN shall be one slesh." It is true, that this reasoning is immediately pointed against unlawful divorces; but it equally applies to the present subject, and as strongly concludes against a man's marrying two wives, as his unjustly putting away one. For we ask this plain question—How can the two be one slesh, when one of the parties hath the liberty of dividing and subdividing himself amongst MANY? How can the husband be said, with any degree of propriety, to CLEAVE TO HIS WIFE, when he hath more than one to share in his attachment and duty, as a husband?

It is evident, that our Saviour's declaration against divorces was generously made in aid of the weaker sex. Nothing, in his view, could sanctify a divorce, but insidelity to the marriage vow. A capricious or a lewd husband might be ready to set up other pleas; but our Lord reprobated them all; and would only admit of one valid plea for a disunion of the nuptial engagement. Now we ask this strenuous advocate for polygamy, whether a man's having the liberty of taking another wise, through any dislike conceived against the first, did not as estectually answer the purposes of his caprice, or cruelty, or lust, as if he were indulged in the full liberty of divorcing at will? Nay, farther: Was not the Law of Moses, which suffered a divorce, much more favourable to the purposes of domettic peace, than the law of Christ, which, on Mr. Madan's plan, entirely forbids all divorces (except for adultery), and yet allows of polygamy? Would it not be a more candid and equitable institution, to

permit the woman to depart from a lewd, tyrannical, and fickle husband, and to be allowed the privilege of marrying another man, than to be constrained, against mutual inclination, to co-habit with him at the same time that he hath another wise to share in his affections—perhaps wholly to engross them?

To set this Author's hypothesis in the true point of absurdity: and contradiction, nothing more is required than to state it. Let our impartial Readers judge.—Moses, from a tender concernfor the peace of families, and more particularly from a generous regard to the woman's happiness and security, commanded, that, if a man had conceived an insuperable dislike to his wife, he should give her a bill of divorcement. By this instrument, drawn up in form, and properly executed, according to the prescribed rites of the Mosaic law, he disclaimed her as his property, and gave her the free and uncontrouled liberty of a virgin or a widow. This bill authorised her marriage with another man. It was never supposed to disgrace her; it chiefly reflected on the caprice and cruelty of her husband. It was ordained to prevent domestic discords, and chiefly provided for the woman's security and happiness. It delivered her from the fcorn, neglect, and oppression of the man, whose bardness of beart (sudnpoxaplia, as our Saviour expresses it, Matth. xix. 8.) might have laid a foundation for endless vexations and contentions, from which even the innocence of the woman could be no protection, as long as she was under any obligation to cohabit. with him.

But on Mr. Madan's hypothesis, the Christian law, instead of relieving, rather aggravates the distress and bondage of a hated and injured wife. The husband, it is true, is not allowed to dismiss her; but he hath the privilege of doing what is still more cruel and insupportable. He may take another wise beneath his roof—yea many wives into his posom—and thus add insult to neglect, and increase all the evils that may arise from jealousy on the one hand, and exultation on the other!

— ξυγγαμοιςι δυςμενες μαλις' αει. Eurip. Androm.

Now we ask, which dispensation (if Mr. Madan's conjecture be true) breatnes most the spirit of justice and impartiality, benevolence and peace? [We know what the women would say. But less they should be supposed to be too much interested in the question, to be capable of giving a fair and unbiassed answer, we considently lodge the appeal with every man who is not a tyrant or a debauchee.]

There is a text, fays Mr. Madan, in the Old Testament, which is looked upon by some to be a direct sorb dance of polygamy, for it stands—the margin of our Bibles—Thou shalt nate to be

take one wife to another; but it is translated in the text-Neither shalt thou take a wife to her SISTER, to vex her, in her life-time. Lev. xviii. 18. Now I would observe, that the marginal reading-me wife to another-disunites entirely the 18th verse from the preceding context to which it belongs: this only treats of marriages which are unlawful with respect to affinity.' This reason is a most fallacious one indeed! The text in question is not introduced into the midft of the class of marriages rendered illegal ' with respect to affinity,' as Mr. Madan would insinuate; but begins a fresh subject, without any more abrupt transition than what is made in the 19th, 20th, and 21st verses, and onward (Vid. the chapter). Here is no forced or unnatural difunion. No subject is broken off by this text, and afterwards refumed. The catalogue of marriages rendered unlawful, by too near degrees of confanguinity, begins at the 6th verse, and ends with the 17th. The succeeding verses treat of other un-lawful connections; and in spite of Mr. Madan's reason, it is just as consistent with every rule of propriety, that polygamy should be forbidden in the eighteenth verse, as uncleanness, adultery, and some unnatural crimes in those which immediately follow.

We do not affirm, with some learned commentators, that this passage contains a full and absolute prohibition of polygamy, because the expression in the original may be thought somewhat equivocal. It is however very certain, that the words will bear the translation given of them in the margin of our Biblesviz. " one wife to another." Mr. Madan indeed seems to think he hath faid fomething to the purpose, by observing, that mink is used four times in other parts of the chapter, and necessarily fignifies, as our translators have rendered it—a fifter.' Not necessarily, however: - for in the passage in dispute, the word is used as an idiom, and not in its simple and common acceptation, as it evidently is in the other parts of the chapter. אשה אל אחותה is a mode of phraseology peculiar to the Hebrew language, and denotes a general union of any beings or things that have the same common nature, whether animate or inanimate, rational or brutal, as the learned Reader will be convinced by comparing the following texts in the original: Gen. xxvi. 31. Exod. xxvi. 3. Exek. i. 9. Chap. iii. 13. Joel, ii. 8.

Beside, it may be remarked, that the reason alleged in the text to discountenance the connection referred to, holds equally good against polygamy in general, as against any particular species of it. "Thou shalt not take a wife to her sister, to vex her, in her life-time." Why was such a reason as this given to sorbid such an alliance? Would a sister be more inclined to promote do-

mestic

mellic jars and vexations than any other woman? Could a man promile himself greater peace and security from the good agreement of two strangers than of two sisters? Mr. Madan, indeed, might instance the case of Rachel and Leah. But it is evident, that the principal fource of their disagreement arose from the fraudulent imposition and jealousy of the one, and the resentment and cutting reflections of the other; which would have happened, independent of any affinity between them, as was afterwards the case in the family of Elkanah (1 Sam. i.). --- If the text be rendered, according to the established idiom of the Hebrew language—" thou shalt not take one wife to another" then the reason drawn from conjugal happiness and domestic harmony, appears peculiarly striking and forcible. shalt not take one wife to another, to vex her, in her life-time:" that is, to torture (as would probably be the case) the heart of the first wife with jealoufy, and expose her to insult and ill Now this is a general reason against polygamy, confidered in its common and universal tendency: whereas, on Mr. Madan's supposition, though the reason be general, and such as will suit all polygamous cases, yet the alliance, it is urged against, is peculiar and specific!—But partiality, and an undue fondness for a darling system, seldom keep terms with consistency or found logic.

The contracted limits of our Journal will not permit us to examine all the proofs and authorities which Mr. Madan hath produced in support of his subject from the Old Testament; but we cannot conclude this article, without taking particular notice of his laboured, but inessectual, attempt to prove, that polygamy is persectly consistent with the genius and precepts of

the Christian religion.

With respect to the New Testament, says he, the subject of polygamy, simply considered, is not so much as mentioned, either good or bad.'....' When St. Paul says, that a Bishop or a Deacon is to be the husband of one wife, it certainly carries in it a tacit allowance of polygamy, as to the lawfulness of it, with regard to all other men;—not that it was sinful in one more than in another, but this was a prudential caution in that distressed and infant state of the church.'

Now, to draw an inference in favour of polygamy for the benefit of the laity, from St. Paul's prohibition of it to the clergy, is a method of reasoning perfectly worthy of the Author and his cause! The oppressive miser, the gross sensualist, the "soldier full of strange oaths, jealous of honour, sudden and quick in quarrel," might all plead the authority of St. Paul to excuse their vices:—for they might say (with Mr. Madan's good leave) that, it is to Bishops, and not to carnal laymen, that

he directs his charge, " not to be given to wine, to be no firk,

ers, nor brawlers, nor greedy of filthy lucre."

There is one passage in the New Testament which Grotius, Whitby, and other learned commentators, have regarded as so decisive and pointed against polygamy, that nothing farther need be said to discountenance the practice of it amongst Christians. This striking passage is found in a Cor. vii. 2, &c. "Nevertheless, to avoid fornication, let every man have his own wise, and every wise her own husband."

As this text, fays our Author, hath been and is looked upon, as a direct proof of the unlawfulness of polygamy amongst Christians, let us give it a thorough consideration. In the first place, let us restore it to its genuine words: for our translators have introduced something in it which is not in the original. The Words in the Greek arc— Dia de tas mopusias—the verb to avoid is not there. The words Tas Mopreias which we translate fornication, are plural and not fingular, and should be rendered fornications or the fornications;—they being in the accusative case, are governed, not by the verb, to avoid, which is not in the text; but by the preposition  $\delta_{i\alpha}$ , which is. This preposition, dia, hath various meanings, according to the case it governs. Sometimes it governs a genitive; sometimes an accusative, and then it may fignify—for—So Dr. Hammond renders it, here-" but far fornications:"-also-with respect to-as towith regard to quod attinet ad, &c. Vid. ver. 26. Sia Thu avayunv, &c.

The context shews very plainly, that what Paul says, is in answer to some questions put to him by letter, and sent to him at Philippi, where he appears to have been: and if we may judge of the questions by the answer, which is surely a fair way of judging, they probably concerned a very infamous, but common practice, that of married men lending out or even marrying wives to other people, and of course the married women

going from their own husbands to other men.'

This arbitrary and groundless conjecture being exalted into a clear and decisive conclusion, our sagacious Commentator offers the following explanation of the whole passage, by way of paraphrase:—'Now concerning the things whereof ye wrote to me—I say first in general, though not for the reasons which some of your philosophers have given, nor for those which the Gnostics have suggested, as it marriage was wrong or sinful in itself, but for prudential reasons arising from the situation of things at this time—it is good (xxlov, useful, piositable) for a man not to souch a woman—to have no dealings with the other sex. (See Matin. xix. 11, 12.) But with respect to the fornications you mention, and concerning which you desire to know my senti-

ments, I answer, conformably to the law of God, which ordains that " a man shall cleave to his wife," &c .- let every man have bis wife—THV YUVAIRA EAUTE—the woman who belongs to him; and not lend her out, or suffer her to marry another; nor let him take a woman who is not youn eauts, i. e. his wife, but another man's, to himself. So also let every married woman bave ber own proper husband, Tev idiov andpa-the man appropriated to her, exclusively of all other men upon earth; and not depart, or fuffer herfelf to be lent or given, to any other man."

In the support of this laboured explanation of a very obvious passage, the Author examines, with an appearance—but it is only an appearance—of great critical exactnets and precision, the ideas which the Apostle meant to convey by the words exem, eauts, and above all, idion - on each of which he hath bestowed uncommon pains, only to discover, in the issue, the weakness of that cause which required so much sophistry and evasion to give

it even the colour of probability.

We before took notice of the new turn which this writer hath artfully given to the preposition dia. Here we would also remark, that through the whole New Testament it is never used in the sense to which he hath perverted it in his paraphrase. He hath confounded it with  $\pi \epsilon \rho i$ —which we meet with in the verte immediately preceding:—for as to the instance he produces (under the cover of Dr. Hammond's respectable name) from 1 Cor. vii. 26. it by no means serves his purpose; since δια την αναγκην may be literally rendered - " on account of neceffity," &c. Thus dia, in the controverted text, ought to have the same meaning affixed to it, and simply, and without any forced construction, implies-that " on account of the hazard of fornication, and every other species of lewdness, every man ought to have his own wife, and every woman her own husband." We repeat our affertion, respecting this word; and defy Mr. Madan to produce a fingle instance, in all the New Testament, in which dia may be fairly and unequivocally rendered according to the idea he hath affixed to it in his com-

The false step which our Critic made at the threshold, was rather ominous of his future ill luck in his progress through the

other part of the text.

When (continues he) the Apostle saith, exasos the exute γυναικα ΕΧΕΤΩ, he certainly uses the verb εχω in a larger fense than merely having. This verb fignifies to possession;—which is to continue the possession of. The Author shrewdly gives this turn to the word, in order to afford some little colour to his application of the passage to the question, which he suppoled, by an arbitrary and most unwarrantable stretch of conjecture, the Apostle was engaged in the decision of, in the text before us. "Let every man keep his wife to himself, and not dispose of her to another." This is our Author's idea: but as his conjecture was presumptuous, so his translation is unwarranted. The universal acceptation of εχω, both in sacred and prosane writers, is that which is very justly adopted in the English translation of the New Testament; and simply means—present tenure or possession. When compounded with the preposition κατα (as κατέχω, in Luke viii. 15), it hath indeed the signification to which Mr. Madan would apply it in the present instance. But as a proof that it doth not fully express this idea of itself, we would refer the Reader to John xiv. 21. "He that bath (εχων) my commandments, and keepeth them (τερων); he it is that loveth me."

But the argument of the "greatest pith and moment" is founded on the difference—the emphatic difference between express and idios! Our Author's reasonings on this head are so curious, and withal so totally false and groundless, that we imagine it will afford some entertainment to our critical Readers by pro-

ducing them at full length.

4 I would observe, that there is a very remarkable difference of expression, which, though preserved in many other translations, is not in ours. We render the two clauses just alike, whereas they are not so in the original, but-TAN EATTOT yuvaixa and tev IDION auspa . . . . "Let every man have His wife; and every woman ber OWN husband."—If " all Scripture be given by the inspiration of God," I cannot but think, that there is some weighty reason for the difference of expression in giving the epithet idior to the husband with respect to the wife, and not to the wife with respect to the husband. This is observable, not only in this place, but in many others (Eph. iv. 24, 25. Col. iii. 18, 19, &c.). The word wise hath certainly an emphatic meaning wherever we find it; therefore must have its emphasis in this place as well as in others. It seems to denote such an appropriation of the husband to the wife, as that she could not have, or go to, any other man. This idea may be illustrated from Rom. xiv. 4. "Who art thou that judgest another man's servant? τω ιδιω κυριω—proprio domino—et to his own master he standeth or falleth." Here ιδιος is used as an epithet to the master with respect to the servant; and must denote fuch an appropriation of the master to the fervant as to exempt the servant from the authority, power, controul, command or service of any other but his own master: for (as was observed before) " no man can serve two masters," though the master may have many servants; nor is any of his servants the less so, because he hath others. So here, the husband is styled or interest whatever in the society of the wise but the 1810s army—the proper and appropriate husband. I own, that I can account for this difference of expression no other way than by supposing the Scripture consistent with itself, and that the distinction so evident in the Old Testament, was to be preserved throughout the New Testament, viz. That though a man might have more than one wife, yet that a woman could have but one husband:—had she more, neither could be properly 1810s army—for she would be as much the property of one as of the other: whereas, doubtless, though a man hath two wives, each may be properly styled your excuse—his wise. Hence youn is never found with the exclusive roses, but coupled only with the pro-

noun possessive, εαυτυ.'

We had no doubt of the fallacy of these reasonings before we particularly examined the New Testament with respect to the meaning of the words in all the places where they are used, Our examination only confirmed our prior fentiments with regard to their acceptation; and we now politively affert, in oppolition to all that this writer hath laboured to prove, that exuros and whice are used indiscriminately by the sacred writers, to express the same, precise idea: and, in support of this affertion, we refer the learned Reader to the following texts, in the original. Matth. xxv. 14. compared with Rev. x. 7. In the former text, it is said — τους ΙΔΙΟΥΣ δελες; in the latter—τοις ΕΑΥΤΟΥ Souhers --- On the comparison of these two passages, the Reader will instantly see the futility of an observation quoted above, and which was introduced with solemn parade, to strengthen the main argument in the matter of idics-viz.-" to his own master—τω ιδιώ κυριω—proprio domino—he standeth or falleth. (Vid. supra.)

In support of our observation, we would also beg our Readers to consult the following passages in the Greek:—viz. Rom. iv. 19. 1 Cor. vi. 18. and 1 Cor. vii. 4. and also Eph. v. 28. Let him compare 1 Cor. iv. 12. with the same Epissle, chap. xi. 5. and also 2 Thess. ii. 6. with Titus, i. 3. And as the Author hath affixed such an emphatic meaning—such an appropriative sense to voice (as if it were essential to and inseparable from aurp), we shall only refer the Reader to Mark x. 11, 12. and Rev. xxi. 2. for a full consutation of every thing

he hath advanced on this head.

We should be forry to grow tiresome in exposing this writer's critical talents; but we cannot conclude this part of the subject without producing one instance more of his gross ignorance, or wilful misrepresentation of Holy Writ—accompanied, as it is, with all the apparent pomp of learning, and all the oftentation of orthodoxy! In Rom. viii. 32. we meet with a very mate-

tial proof (says Mr. Madan) of the emphatical import of the word idios, to denote Christ's being God's own, proper Son, in such a sense as an creature is, or can be. So in the passage under consideration, the word idios denotes that the man is the woman's husband in such a sense as no other man is or can be.'

It is the peculiar infelicity of this Author to be most positive where he hath the greatest reason to be dissident; and to step forward with an air of unblushing self-considence, to possels the very ground that will not afford him one inch of solid matter to rest his soot on:—for, in the very chapter where he finds as united to vios, he might have sound exure advanced to the same dignity, and standing in the same connection. See Rom. viii. 3. "God sending his own son—τον ΕΑΥΤΟΥ viov."—Blush, considence!—for here thou canst have no re-

fuge even in evalion.

Having driven this Writer from every hiding-place to which fophistry itself could lead him, we leave the sacred text, cleared from the rubbish of false criticism, to speak for itself. " Now concerning the things whereof ye wrote me; it is good for a man not to touch a woman. NEVERTHELESS, on account of fornications—on account of the great hazards which arise from a fingle life, where the temptations to the breach of chastity, by various acts of lewdness, are in many cases peculiarly strong and almost irrefistible—let every man [exactor corresponding, not so much with arry, husband, as with the preceding relative arepumos, man, in general] have his own wife, and every woman her own husband." The Apostle adds, ver. 4. "The wife hath not power of her own body, but the husband; and likewise also the husband hath not power of his own body, but the wife." How can the latter part of this verse agree with the doctrine of polygamy? Tortured and disfigured by the Jesuitism of this Author, it still opposes his doctrine. For it plainly afferts, that the claims of the husband and wife are reciprocal, and in the same degree. ask Mr. Madan, how the husband hath power over the body of his wife? He will answer, that this power consists in the husband's fole and exclusive right to the entire and unalienable possession of his wi'e. But is it not equally clear, that the power of the wife is precisely of the same nature, and to the same extent? Is not the expression literally the same? Can we imagine, that in one case it means a limitation, and in the other a latitude, of conjugal duty?—that the possession of one is confined to an individual; and that of the other, unlimited by any number whatever? The supposition is the most extravagant and unnatural that abfurdity can devise, tyranny adopt, or lewdness vindicate.

Our limits will not permit us to enter into a minute examination of his position respecting the immutability of the Divine law. Under this head, we could point out various instances' of palpable mistakes, gross misterpresentations, and most insignificant criticism. His general idea on this subject may be collected from the conclusion of the 5th chapter. 'From all that hath been said, I do conclude, that Christ was not a defiroyer of the old law, nor the giver of a new one:—that therefore, the business of polygamy, and ALL OTHER points, relative to the commerce of the sexes, were fully adjusted and settled by the Divine Law, subject to no alteration or change whatsoever, by any power in EARTH or HEAVEN. For thus says the SPIRIT, Eccles. iii. 14. "Whatsoever God doth, it shall be forever; nothing can be put to it, nor any thing taken from it."

This general and unqualified position, delivered with the solemn tone of an oracle, must, to be true, admit of no exception in any one case whatever. Now, we could produce many clear and unequivocal exceptions; but we think one instance, which we shall produce, sufficient of itself to demonstrate the

fallacy of our Author's reasonings on this subject.

Adultery was deemed, by the law of Moses, a capital offence: and it is so enormous and aggravated a crime in Mr Madan's eye, that he laments that the severity of the ancient law should be relaxed, with respect to the punishment of it, in Christian countries. He wishes to see the law, which adjudged death to both parties, revived with all its horrors. How far this would be confistent with found policy, or Christian lenity, it is not our business to examine. But supposing the tremendous fanctions which guarded the law of marriage and betrothment (both being deemed equally sacred) were re-established, we ask this Christian-Levite, whether he would permit the old exception in favour of the man who only committed adultery with a bond-woman, to fland in lege Mosaica RESTITUTA? - Would he have that exception fanctioned by our Legislature? Or, as a Christian—as a Christian, we say, would he admit of no distinction between "Greek or Jew, Scythian, Barbarian, bond or free;" and fo make adultery capital in all cases, let the married or betrothed woman he of what country, condition, or complexion whatfoever? In Deut. xxii. 23, 24. it is enacted by a positive ordinance, that the defilement of a virgin, betrothed to a husband, should be punished with death. "Ye shall bring them both out unto the gate of the city, and ye shall stone them with stones that they die," &c. But in the case of the bond-maid, the severity of this law was relaxed to both parties; though it would need fomething more acute than the ingenuity of Mr. Madan, to point out the effential difference, in a moral view, between adultery with a bond-woman and a free. And yet the Law, which Mr. M. calls immutable, and which had fully adjusted all points relative to the commerce of the sexes, treats adultery with the former

former as a matter of private and venial trespass; and enacks that "whosoever lieth carnally with a woman that is a band maid, betrothed to a busband, and not at all redeemed, nor freedom given her, she shall be scourged: they shall not put her to death, because she was not free. And he shall bring his trespass-offering, &c. and the priest shall make an attonement for him, &c. and the sin which he hath done shall be forgiven him." See Lev. xix. 20.

Far, very far, be it, either from our design, or our wishes, to infinuate the slightest reslection on the Mosaic law. We are thoroughly satisfied as to its admirable policy:—but surely it cannot be revived, even in matters 'relative to the commerce of the sexes,' and other affairs of moral, civil, and domestic life, without overturning the great laws of a Christian state; and introducing a train of evils, that the gentle spirit of the Gospel and all its pure principles and motives were designed to controul

and extirpate.

The Author would accuse us of an important desect in the review of his Treatife, did we omit to mention a great modern authority, to which he appeals with some degree of exultation in favour of polygamy. It is the authority of the celebrated Bishop Burnet, whose small tract on this subject is deposited in the British Museum; and having been transcribed from that copy, is here printed entire, by way of Appendix to the 4th chapter. His arguments indeed are of the most trite and hacknied nature: but there is one observation which we cannot allow ourselves to pass over without taking some notice of it. "It is to be confessed (says the Bishop), that polygamy was much condemned by the antients, though, I think, I have met with famething about it that is little noticed:—but of that I can adventure to say nothing, at this distance from my books and papers." Dr. Delany, in his "Reflections on Polygamy," quotes this very passage, and observes, that "this was the best excuse that could be given for so rash a decision, which it would have been for the honour of the Bishop's reading to have retracted when he returned to his books."-Mr. Madan is very angry with the learned Dean for this 'unfair' reflection; and expresses his forrow that his lordship was so far distant from his books and papers; otherwise (he concludes) it is most probable, that the Bishop would have produced some valuable testimonies from the ancients, concerning which he hints at, as little noticed.'

What important discoveries his lordship might have made, is a matter quite undetermined, and therefore we have no concern with Mr. Madan's MOST PROBABLE. What hath not been done, must, in the present case, pass for what could not be done: and we think Dr. Delany perfectly justified in his resections

reflections on a vague and unauthenticated remark, which, founded on a faint conjecture, was more calculated to amufe and deceive, than to convince and inform.

We have read the writings of some of the earliest fathers of the Christian church, and have not perceived the faintest trace of any thing resembling a testimony to the lawfulness of polygamy. On the contrary, we have noted a variety of passages, in which the practice of it is strongly and explicitly condemned. We will particularly refer the curious and learned Reader to Justin Martyr's Dialogue with Trypho the Jew. Vid. Greek edition, by Thyrlby, sol. p. 336. 423, and particularly p. 372, where are these very remarkable words—MONH thy yameth yunain EKASTOS—exactly similar to the text we have before rescued from the oppression of our theological Procrustes (1 Cor. vii. 2.).

We also appeal, for the antiquity of a commanded and practifed monogamy, to the Stromata of Clemens Alexandrinus, lib. iv. p. 312. 335, 336. Edit. Heinsii et Sylburg. Lug. Bat. Fol. 1616. η δευτερα περικοπη MONOΓΑΜΙΑΝ ις ησιν. Again: ε ΠΟΛΥΓΑΜΙΑΝ ετι συγχωρει, viz. Jesus Christ, called immediately before πυριος—who "restored the ancient institution of marriage, and would not (as the venerable father says) permit polygamy to be practised now-a-day."

Mr. Madan will indeed contest the authority of these ancient fathers: though, from his great eagerness to avail himself of every testimony in his favour, we doubt not, but that he would have esteemed it a most convincing proof of the lawfulness of polygamy, could he have produced such respectable witnesses for it, as we have produced against it. On subjects merely speculative, where the fancies of different men will strike out different conjectures, which it is the business of ingenuity to colour with the femblance of truth, we should not be biassed by the weight of antiquity, or prejudiced in our decisions by the authority of names. On matters of opinion, argument would hold the first place, and we should only be determined by the evidence of reason. But in matters of fast, where sancy is not allowed to sport itself in hypothesis, we consider the Fathers in the light of credible historians: and when they bear a uniform and difinterested testimony to a known and common practice, it would discover an unpardonable degree of sceptical obstinacy and partiality, not to allow them the credit of veracity.

These observations are of weight in the question before us. Justin Martyr and Clemens Alexandrinus, who lived very near the apostolic age, positively condemn the practice of polygamy, and represent it as totally inconsistent with the genius of Christianity, and the established rites and usages of the evangelic church. Whether they reasoned well or ill on the subject, is Rev. Nov. 1780.

not the point in debate. Did they, or did they not, bear testimony to a simple and obvious fact?—and is their testimony to be credited?

In a word—when we reflect, that the primitive institution of marriage limited it to one man and one woman; that this institution was adhered to by Noah and his fons, amidst the degeneracy of the age in which they lived, and in spite of the examples of polygamy which the accurfed race of Cain \* had introduced; -when we confider how very few (comparatively speaking) the examples of this practice were amongst the faithful; how much it brought its own punishment with it; and how dubious and equivocal these passages are in which it appears to have the fanction of the divine approbation; -when to these reslections we add another, respecting the limited views and temporary nature of the more ancient dispensations and institutions of religion-how often the imperfections, and even vices of the patriarchs, and people of God, in old time, are recorded, without any express notification of their criminality—how much is said to be commanded, which our reverence for the holiness of God and his law, will only fuffer us to suppose, were, for wise ends, permitted—how frequently the messengers of God adapted themselves to the genius of the people to whom they were sent, and the circumstances of the times in which they lived;-ABOVE ALL, when we consider the purity, equity, and benevolence of the Christian law; the explicit declarations of our Lord, and his Apostle St. Paul, respecting the institution of marriage; its delign and limitation:—when we reflect, too, on the testimony of the most ancient Fathers, who could not posfibly be ignorant of the general and common practice of the Apostolic church: - and, finally, when, to these considerations, we add those which are founded on justice to the semale sex, and all the regulations of domestic occonomy and national policy, we must wholly condemn the revival of polygamy; and thus bear our honelt tellimony against the leading design of this dangerous and ill-advited publication.

As to the merit of this work, considered as a composition, we can only in general say, that the language is aukward and inclegant; that the subjects are not always happily arranged; and that the repetition of the same arguments, instead of rendering them more forcible, renders them insufferably tedious.—We leave it to our NOMINAL Critics to trace out the minuter errors of this treatise,

<sup>&</sup>quot;Gen, iv. 19. Lamech, the father of the polygamists, is the great hero of Lyjerus; and though Mr. Madan doth not triumph with such loud acclamations in his praise, yet he appears to have a secret veneration for his memory, and is much displeased with good Mr. Henry, for wounding polygamy through the suc of its founder.

and those verbal inaccuracies, which it is the glory of our modern "word-catchers" to detect and expose in form. Here, indeed, the harvest is abundant; and our labourers may eat their bread without any sweat on their brows!

We shall now take leave of Mr. Madan and his Work, with " recommending to his ferious and reverend attention" two lines from a Heathen poet, which no Christian might have been

ashamed to have written:

Num uxor contenta est, quæ bena est, uno viro, Qui minus vir una uxore contentus siet?

PLAUTUS, Mercat. B...k.

ART. II. Galic Antiquities, confishing of a History of the Druids, particularly of those of Caledonia; a Dissertation on the Authenticity of the Poems of Ossian; and a Collection of ancient Poems, translated from the Galic of Ullin, Ossian, Orran, &c. by John Smith, Minister of Kilbrandon, Argyleshire. 4to. 10 s. 6 d. Boards. Edinburgh printed; for Cadell in London. 1780.

HE Author of this performance endeavours to illustrate the account of the Devide the account of the Druids, given by the Greek and Roman writers, by the remains of ancient customs and manners in the Highlands, and by some expressions and idioms still used in the Galic language. In his Differtation on the authenticity of Offian's poems, he attempts to confirm the arguments already offered on this subject by Lord Kaims, Dr. Blair, and Mr. Macpherson; and to answer the objections which have been started by Dr. Johnson and other critics, since the publication of these performances, which were intended to affert the honour, and to vindicate the fame, of the ancient Celtic bard. We apprehend that this part of the work will not at present excite any high degree of curiofity. The learned are in general little disposed to doubt, that the finest passages of the poems of Ossian exist in the Galic language. Whether the whole exists in that language, nearly in the same form in which we have it in English, is a matter which the prudent attention of the Editor to his own interest (for we are unwilling to adopt the harsh language of Mr. Macpherson's antagonist) seems to have left doubtful; but one thing is not doubtful, that to the dispute concerning their authenticity, the poems of Ossian owe no small share of their celebrity.

We pretend not to dispel, what the inimitable Writer of the History of the Decline and Fall of the Roman Empire calls, the doubtful mist that hangs over the Highland antiquities; yet we cannot but admire the ingenuity of Mr. Macpherson's contrivance, if such it be allowed, who has established the same of his English translation, by leaving us uncertain concerning the authenticity of the original, and that without detracting any

thing from the glory of the son of Fingal. The finest passages of the Galic poems, which are still repeated in the Highlands, will secure the immortal renown of Ossian, who can easily space to Mr. Macpherson the merit of having disposed, combined, and extended them to a proper form for a literary publication. There is no Reader of taste, but must admire the warmth and energy of many of Ossian's descriptions. Several passages both in Fingal and Temora are exceedingly beautiful and affecting; but his works, considered as a whole, are no more than a de-lightful piece of poetical patchwork. They may be compared, hdeed, with the defultory productions of Oriental fancy, and They will not lose much by the comparison; but to set them in competition with the fublime models of Grecian genius, is an

infult to the judgment and common sense of mankind.

The Translator of the fragments now presented to the Public, speaks familiarly of the Celvic Platos and Homers. But of the philosophy of the Celts we have not yet received any specimens; and that their wife men ever communicated any knowledge to the Greeks, rests on the seeble authority of Diogenes Laertius (Note Laert. in Proæm.). As to the phrase of Celtic or Highland Homers,' we could wish to see it entirely laid The facred name of the immortal father of verse ought not to be prophaned by ignoble comparisons; and the preposterous adulation offered to the fon of Fingal, instead of exalting his character, exposes both himself and his admirers to ridicule and contempt. As a curious monument of antiquity, the poems of Ossian deserve attention and respect. In this view, they have been translated from Mr. Macpherson's English version into several foreign languages, particularly the German and the Italian; and, in this view, they are confidered by the learned of Europe. But, if they are examined by the rules of Epic poetry, we shall find, that whether we consider the invention and disposition of the sable (ή των πραγματών συς ασις), the representation of characters and manners (τα ηθη), or the natural beauty and verisimilitude of the language and expression (To THE λεξεως πιθανον), they have not any title to be ranked in that most sublime class of poetical composition; at least, until the rules of Aristotle be abolished; rules which have been adopted by all civilized nations, because they are founded on the practice of Homer, or, in other words, on the laws of nature; for Nature and Homer are acknowledged to be the fame by the general consent and imitation of critics and poets, as well as by the universal admiration of human kind.

The present collection is given to the Public, without being dignified with the name of Tragedies, Elegies, Epoposias, of any other specific appellation, by which the Greeks discrimimated their works of literary genius. The Translator calls them,

them, fimply, Poems; which shows a very becoming modesty, as well as propriety; for, unless he had called them "Battle-pieces," we know not by what specific name they could have

been accurately distinguished.

The uniformity of subject, the sameness of imagery, and the monotony of flyle, render it impossible, without extreme fatigue, to give these Galic poems a continued perusal. the descriptions, which form the least exceptionable part, are generally fo uncouth and abrupt, that, in order to relifh, it is necessary to study them; and poetry which requires study, cannot be very pleafant. The odes of Pindar, the choral fongs of the Grecian tragedies, are not an exception to this rule. The glowing expressions, the bold inversions of style, the innumerable allusions to ancient history and fable, as well as to the multiplied forms and ceremonies of polished life, render many passages difficult to us, which were easy to the Greeks, and which, after a proper study of the history, the language, and the customs of antiquity, become easy to the modern Readers But the obscurity of Ossian arises not from our ignorance of the manners, the amusements, or the employments of his age, which were few, fimple, and uniform; but from his unufual mode of expressing the most common ideas and sentiments, his gigantic hyperboles, and his unceasing train of comparisons and metaphors, which, though continually borrowed from the fame objects, yet, as they are employed unnecessarily on almost every occasion, distract the attention, perplex the understanding, bewilder and confound the imagination of the Reader.

Having made these observations concerning the general merit and principal desects of Galic poetry, we should proceed to examine the present translations, and to compare them with those formerly published by Mr. Macpherson. Upon this subject the Author expresses himself in a manner which is not likely to excite the partiality of the Public in his favour. Whatever reception these pieces may meet with from the Public in their present form, the Translator shall reckon himself much honoured by the approbation and encouragement which some of the first judges of poetical composition have been already pleased to bestow on them. Whether this approbation has been justly bestowed, the Reader will be enabled to judge, from a specimen, which appears to us one of the least excep-

tionable in this collection.

#### CATHLUINA: A POEM .

'The Argument.] Annir, the daughter of Moran, having been loved by two intimate friends, Gaul and Garno, refolved to get rid of

<sup>.\*</sup> In the district of Lorn in Argyleshire, there is a lake which is now called Loch-arich, but anciently Loch-luina, or Lochluana. Near it was probably the scene of 2. 2.

the last by a stratagem.—In the disguise of a stranger, she brought him a challenge from Duaran, who, she alleged, was his rival, and whose prowers she thought he would not chuse to encounter. But being disappointed in this, and resolved to get rid of Garno at any rate, she delivers the same message to Gaul. consident that his superior valour would give him the victory.—The two friends met in the night, and sell by mutual wounds. The issue of her plot affected Annir so much, that she could not long survive it.—The poem opens with some restections suggested by the scene where they were all buried, and concludes with their suneral song.

I hear the murmur of the brook; I hear its fall over the rock. Lead me, son of youth, to that oak which spreads its branches over the stream. At its soot, three gray stones list through withered grass their heads, and meet the falling leaves. There sleep the friends of Osian. The murmuring stream they hear not: the rushling leaves they heed not. In the chamber of their rest, the steps of our approach

will not disturb them.

Many, son of youth, were the valiant on the hills of Morven. in the days of our joy. But the blaft came and spoiled our wood of its Jeaves. It overturned our lofty pines on their green mountains. It whiftled with its wintery noise through our palaces, and marked its dark path with death. The season of our joy is a sun-beam that is past; the voice of gladness in our hall is a song that hath ceased; and the strength of our heroes is a stream that is no more. The owl dwells in our fallen walls, and the deer graze on the tombs of the The stranger comes from afar to beg the aid of the King. He sees his halls, and wonders they are desolate. The cow-herd, careless, whisling, meets him on the dusky heath, and tells him the heroes are no more. "Whither," he says, " are the friends of the feeble gone; and where is Pingal, the shield of the unhappy?"-They are gone, O stranger, to their fathers. The blast hath laid the mighty, like the tall pines of Dora, low; and the fons of the feeble grow in their place. Thou feest on every hill the tombs of those who helped the unhappy. Thou seest their stones half-sunk, amidst the rank rustling grass of the vale. The heroes have made their bed in dust; and silence, like mist, is spread on Morven.

But the voice of Cona's harp, ye mighty dead, shall be heard in your praise. The stranger, as he passes, may attend perhaps to the song. Listening on his spear, at times, he stands. The bard sees him not, but his sighs are often heard. Humming the tale he goes away, and, mournful, tells it at the streams of his land. Young bards shall hear it as they bend, silent, over their listening harps,

On future times they will pour the fong.

We are come to the place; but where are the stones that mark the abode of my friends? Lift your heads, ye gray mossly stones; lift your heads, and tell whose memory you preserve. Why shrink

this poem. Many places in its neighbourhood are still denominated from Offian's heroes.

The fon of youth, to whom this piece is addressed, is supposed to be the same with the fon of Aipin, so often mentioned in some other ancient poems. Tradition relates many stories of him; among others, that he took down in writing all the poems of Offian as they had been repeated to him by that eld and venerable bard.

you in your moss, forgetful of the mighty below you?—But I will not forget you, companions of my youth. Your fame shall remain in my fong, when these mouldering stones shall fail.—Often did we shine together in steel, and pour death on fields, like roaring streams. Mighty were ye then, my friends, though now so low! Mighty were your deeds when you strove together here. Listen to the tale, son of

youth, and let thy foul be kindled to deeds of fame.

Gaul and Garno were the terrors of the plain: their same was in the land of strangers. The strength of their arms was unmatched, and their souls were steel. They came to the aid of Moran. They went to the hall of the chief, where it lists its gray head, in the midst of trees, in the green isse of Innissuia — The daughter of Moran seized the harp, and her voice of music praised the strangers. Their souls melted at the song, like a wreath of snow before the eye of the sun. The heroes burned with equal love to Annir; but it was on Gaul alone that she rolled her blue eye. Her soul beheld him in the dreams of her rest; and the streams of Innissuian heard, in secret, his name.—The daughter of Moran turned away her eye from the brow of Garno; for she often saw the sire of his wrath arise, like a dark slame when clouds of smoke surround it.

Three days the heroes feasted. On the fourth they pursued the chase on the heth of Luina. The maid followed at a distance, like a youth from the land of strangers. She followed to tell the words

of fear, that Garno might leave the land +.

The sun looked down on the sields, from beyond the midst of his course, and the panting roes still lay in the shade of the rock. Garno sat on Caba's rugged top. His quiver is by his side, and Luchos lies at his seet. Beside him is the bow with the head of horn, unstrung. He looks round for the deer; he sees a youth. "Whence are thy steps," said the dark-brow'd chief; and where is the place to which thou art bound?"—

"I am," replied the youth, "from the mighty Duaran, chief of the halls of Comara. He loves the daughter of Moran; but he heard that Garno wooed his love. He heard it, and fent me to bid thee yield the fair; or feel, this night, the strength of his arm in battle."

"Tell that proud fon of the sea, that Garno will never yield. My arm is strong as the oak of Malla, and my steel knows the road through the beast or heroes. To Gaul alone, of all the youths on the hill, I yield the right hand in battle, since he slew the boar that broke my spear on Elda.—B.d Duaran sly to his land: bid him retire from the daughter of Moran."

"But thou halt not seen Duaran," said the youth. "His stature is like an oak; his strength as the thunder that rolls through heaven; and his sword as the lightning that blasts the affrighted groves. Fly

Who this Gaul was, is not certain. He is probably the same with him who speaks in that dialogue often soisted into the poem of Gaul the son of Morni, and beginning with

A righthin is binne ceol,

Gluais gu malda 's na gabh bron, &c.

<sup>†</sup> For most of this and the two following paragraphs, we are more indebted to the tale than to the poem, which is defective.

to thy land, lest it leave thy withered branches low, and strew on the

heath thy blue arms."

"Fly thou, and tell Duaran I meet him.—Ferarma, bring me my shield and spear: bring me my sword, that stream of light.— What mean these two angry ghosts that sight in air!—The thin blood runs down their robes of mist; and their half formed swords, like faint meteors, fall on sky-blue shields.—Now they embrace like friends. The sweeping blast passes through their airy limbs. They vanish. I do not love the sign; but I do not fear it, Ferarma, bring my arms."

The maid retires. She is grieved that Garno will not fly. But fhe heard him fay that to Gaul he yielded in battle. To the hill of his chase are therefore her steps.—The hero leans on his spear: a branchy deer lies by his side, and his dogs are panting around. His looks are towards the green dwelling of Luina. His thoughts are of

his lovely Annir; and his voice is heard in her praise.

of the morning. Mild is the blushing of thy face, O Annir, as that fun, when he looks through the ted-tinged clouds of the West, and the green tops of the mountains smile. O that I saw thee on the hill of deer, in all thy beauty; that I saw thee like the young pine in the vale of Luina, when it softly waves its head in the gale, and its glittering leaves grow in the shower of the sun!—Then would my soul rejoice as the roe, when he bounds over the heath in his speed; for lovely art thou in the eye of Gaul, thou daughter of car-borne. Moran!"

"And art thou Gaul?" faid the approaching youth. "Thy Annir may be lovely, fon of Ardan; but dire is the battle thou must fight. Duaran loves the maid: on that hill he awaits thy coming.

Yield, Gaul, thy love to Duaran."

"My love I will yield to none. But tell thou that chief to come to the feast to-night. To-morrow he shall carry away the gift of a

friend, or feel the strength of a foe."

"Thou mayst spread the feast, but thou must eat it alone; for Duaran comes only to list the spear. Already I see his distant steps. He stalks like a ghost on that dusky heath. The beam of his steel supplies the departing light; and the clouds brighten their dark-brown sides around him. Hark! he strikes his shield. Its sound is the death of heroes."

\* Ait mar eilid an aonaich, Na deann air raon nan rua 'bhoc, Tha m' anam fein, tra chi mi do dhreach, Inghean Mhorain nan each 'a nan carbad.

Corrborne is always a title of diffinction in the poems of Offian. That the ancient Britons and Caledonians used cars and chariots of various kinds, is a fact so well attested by Tacitus, Mela, Cæsar, and other authors of credit, that none has room to ask, Where could they drive them? Their chariots of war were generally armed with seythes, and called cobb'ain, (the covinus of the Latin writers), from co-bbuain, a word which signifies, "to hew down on all sides." Of this kind seems to have been the samous car of Cuthullin in the 1st B. of Fingal, and the 4000 which Cæsar ascribes to Cassibelanus—Besides this, the ancient Caledonians, as they inhabited a mountainous and uneven country, used for state a sort of litter, borne between two horses in a line, and somewhat in the shape of a bier. Hence, in Galic, the word carbad is used either to denote "a bier" or "a chariot."

4 Gaul

Gaul covered himself with his arms, like a ghost that clothes his dark limbs with meteors of light, when the mountain heads are shaking in thunder. He moved to the hill from which he heard the sign of battle. As he went he hummed a careless song. He thought

of his Annir, and the deeds of his former days.

Here, son of youth, the warriors met. Each thought his soe was Duaran: for night was dark on the hills, and this oak concealed the sky. Dreadful was the wrath of the heroes; dreadful was the echo of their swords, as they mixed on high, like streams of lightning, when they issue from dark clouds of many folds. The hills reply to their shields. Luina trembles, with all its woods. The heath shakes its head; the roes are assaid in their dreams; they think the chase is already up, and the thought of their sleep is of danger.—Still louder grows the noise in their ear; they think the approach of the hounds and the twang of the bow are nearer. From their midnight slumber they start; their face is towards the desert.

Terrible and long was the strife of battle.—But the shield of Gaul is clest in twain: and the blade of Garno slies in broken pieces. Its sound is like the whirlwind on Ardven, when it tears the heath

from its roots, and ruftles through the leafy oak.

Gaul stands like a whale, which the blue waves have lest bare upon a rock. Garno, like the return of a stormy wave, rushes on to grasp the chief. Around each other they clasp their sinewy arms; like two contending spirits of heaven, when all the storms are awake. The rocking hills shrink with sear from the thunder of the sons of the sky; and the groves are blasted with their lightning.—Thus from side to side the warriors bound. Rocks with their earth and moss sly from their heels. Blood, mixt with sweat, descends in streams to the ground. It wanders through the green grass, and dyes the passing rill.

All night they fought. With morning light the fon of Ardan falls on earth, and his wide wound is exposed to day. The helmet falls from his face. Garno knows his friend. Speechless and pale he stands, like the blasted oak, which the lightning struck on Mora in other years. The broad wound in his own breast is forgot. The rod

current flows unperceived. He falls beside his friend.

. "Blessed," he said, "be the hand that gave the wound! My body, O Gaul, shall rest with thine, and our souls shall ride on the same sair-skirted cloud. Our sathers see us come: they open the broad gate of mist: they bend to bail their sons, and a thousand other spirits are in their course. We come, mighty ghosts; but ask not how your children sell. Why should you know that we sought,

Bhuail iad ann fin air a cheile, Gu cruaidh cuidreach is do-bheumach, Chaidh an leirg air chrith fui'n cafaibh, 'S chaidh teine da'n armaibh glafa. Bhuaileadh iad gu neart'ar dobhidh Mar dha-bhuinne ri cruaidh cho'rag. Cho-f hreagair na creagan 'fina beanntai' Do airm nan Curine calma,

Another edition of the poem deferibes this combat formewhat differently, but with almost equal energy, in the following lines;

as if we had been foes? Enough that you know your fons were brave. But why have we fought together; why have I heard the name of Duaran ?"

. Gaul heard the voice of his friend. But the shades of death are on his eyes: they see but dimly half the light. " Why did I fight," he faintly faid, "with Garno; why did I wound my friend; why did I hear of Duaran? O that Annir were near to raise the gray stone of my tomb!—Bend down, my fathers, from your airy halls, to meet me!" His words were heard no more. Cold and pale in his blood he funk.

Annir came. Trembling were her steps: wild were her looks: distracted were her words. "Why fled not Garno? why fell my Gaul? Why was heard the name of Duaran?" The bow dropped from her hand: the shield fell from her breast. Garno saw her, but turned away his eye. In filence he fell asleep .- She came to her lovely Gaul. She fell upon his clay cold corfe. There the fair, unhappy mourner was found; but she would not be torn from her love.

All day, the fur, as he travelled through his watery cloud, beheld her grief. All night, the ghosts of rocks faintly answered to her figh. On the fccond day her eyes were closed. Death came, like the calm cloud of sleep, when the hunter is tired upon his hill, and

the filence of mist, without any wind, is around him. " Two days the father of Annir looked towards the heath: two

fleepless nights he listened to all the winds. "Give me," on this morning he said, "my staff. My steps will be towards the desert."— A gray dog howls before him: a fair ghost hovers on the heath. The aged lifts his tearful eye; mournful he spies the lovely form .- "

Amidst the striking beauties of the above specimen, we may remark the general defects which characterise the Galic poetry. The merit of the translation is not inconsiderable; yet Mr. Smith's style will not bear a comparison with Mr. Macpherson's in point of melody, rhythm, variety, or force of imitation; the four principal qualities by which the Grecian critics estimate the respective value of literary compositions \*.

ART. III. Some Account of the Alien Priories, and of such Lands as they are known to have possessed in England and Wales. In Two Volumes 8vo. 7 s. sewed. Nichols, &c. 1779.

THE learned in antiquities will doubtless find much entertainment in this work; but it is of a kind which will not be relished, except by those who value names and dates for their own fakes. As it is not probable that this is the case with the majority of our Readers, we think it sufficient to lay before them the Editor's general account of Alien Priories, prefixed to the detail which he has collected concerning the inftitution, structure, and history of the cathedrals and religious houses in Normandy and other parts of France.

· Alien Priories were cells of the religious houses in England which belonged to foreign monasteries: for when manors or sithes were given to foreign convents, the monks, either to increase their own rule, or rather to have faithful stewards of their revenues, built a small convent here for the reception of such a number as they thought proper, and constituted priors over them. Within these cells there was the same distinction as in those priories which were cells subordinate to some great abbey; some of these were conventual, and, having priors of their own chufing, thereby became entire focieties within themselves, and received the revenues belonging to their several houses for their own use and benefit, paying only the ancient apport +, acknowledgment, or obvention, at first the surplusage to the foreign house; but others depended entirely on the foreign houses, who appointed and removed their priors at pleasure. These transmitted all their revenues to the foreign head houses; for which reason their estates were generally seized to carry on the wars between England and France, and restored to them again on return These Alien Priories were most of them founded by suck of peace. as had foreign abbies founded by themselves or by some of their fa-

The whole number is not exactly ascertained; the Monasticon hath given a list of 100; Weever (p. 338) says 110; an account is here given of 146. A few in Normandy, mentioned in Neustria Pia only (whose lands have not yet been discovered), are supposed to have been founded by some of the ancient English nobility or their

descendants.

Some of these cells were made indigenous or denizon, or endenized.

The Alien Priories were first seized by Edward I. 1285, on the breaking out of the war between France and England; and it appears from a roll, that Edward II. also seized them, though this is not mentioned by our historians; and to these the act of restitution 1 Ed. III. seems to refer.

In 1337, Edward III. conficated their estates, and let out the priories themselves with all their lands and tenements, at his pleasure, for 23 years; at the end of which term peace being concluded between the two nations, he restored their estates 1361, as appears by his letters patents to that of Montacute, c. Somerset, printed at large in Rymer, Vol. VI. p. 311. and translated in Weever's Funeral Monuments, p. 339. and in the Appendix to Vol. II. No. VI. At other times he granted their lands, or lay pensions out of them to divers noblemen. They were also sequestered during Richard II.'s reign, and the head monasteries abroad had the King's licence to sell their lands to other religious houses here, or to any particular perfons who wanted to endow others.

Henry IV. began his reign with shewing some favour to the Alien-Priories, restoring all the conventual ones, only reserving to him in time of war what they paid in time of peace to the foreign abbies.

<sup>+</sup> Apportus or apportagium (from portare), an acknowledgment, oblation, or obvention to the mother house or church. Du Cange.

They were all dissolved by act of parliament, 2 Henry V, and all their estates vested in the crown except some lands granted to the

college of Fotheringhay.

The act of diffolution is not printed in the flatute books, but is to be found entire in Rymer's Pædera IX. 283, and in the Parliament Rolls, Vol. IV. p. 22, whence it is copied in the Appendix to Vol. II. No. IX.

In general these lands were appropriated to religious uses.

Henry VI. endowed his foundations at Eton and Cambridge with the lands of the Alien Priories, in pursuance of his father's defign to appropriate them all to a noble college at Oxford.

Others were granted in fee to the prelates, nobility, or private

persons.

'Such as remained in the crown were granted by Henry VI. 144c, to Archbishop Chichley, &c. and they became part of his and the

royal foundations.'

The work has every appearance of correctness and authenticity; and is ornamented with several views of ancient churches and abbeys, neatly engraved.

ART. IV. An Address to Dr. Priestley, upon his Dostrine of Philosophical Ne. essit illustrateday, 8vo. 2 s. Cadell. 1780.

ART. V A Letter to Jacob Bryant, Efq; in Defence of Philosophical Necessity. By Joseph Prieslley, LL. D. F. R. S. 8vo. 1 s. Johnson. 1780.

R. Priestley answers his opponents so quickly, that he seldom allows us flow-paced Reviewers any interval between the attack and the defence. Accordingly we have more than once already coupled them together, as we now do, in our Journal. We scarce remember, however, to have seen an instance of two champions in the fields of controversy, each of them persons of great eminence in the republic of letters, so unequally matched, as the present opponent and his answerer:—a dwarf—[we mean, quoad hoc only] assaulting a giant!

Whatever celebrity Mr. Bryant—for he is the Author of the Address—may have justly acquired by his former writings, particularly his New System of Ancient Mythology, he will by no means add to it by having entered into a controversy, with the subject of which he plainly appears to be very little acquainted; and yet he tells us, that it is 'a subject which he had much confidered; and had indeed long since, for his private satisfaction, written down his thoughts upon it;' and surther, that, on the present occasion, 'he formed a resolution not to be too hasty in his conclusions: but to read the Treatise on Necessity over with that attention and care, which every thing deserves that proceeds from a person so justly celebrated as Dr. Priestley,'

That

That Mr. Bryant does not fully possess the ground of the controversy in which he has thought proper to engage, is evident from his very outset. He thinks that he is opposing Dr. Priestley, and convicting him of inconsistency and paradox, when he represents him as maintaining the doctrine of philosophical necessity, and yet at the same time allowing that men have the power of doing whatever they will or please. Dr. Priestley certainly not only acknowledges, but maintains that a man can do what he pleases or wills: but he has likewise repeatedly added to this position another, which is—that a man wills after a certain and definite manner, in definite circumstances:—or, that the will itself is previously and necessarily determined by some cause external to itself, or by the strongest motive.

Thus the very foundation of the doctrine of philosophical necessity is evidently not understood by Mr. Bryant, after all the consideration which he has bestowed on the subject. He sometimes speaks the language of the Necessarian, in the same paragraph where he is supporting the opposite doctrine of philosophical liberty. No wonder, then, that we often find him hestitating and losing himself.— Permit me here, says he, when treating on this very subject, to make a short pause, and consider what has been said; for, being rather short-sighted, I am apt to overlook the clue, which should lead me, and am soon

lost in a maze.'

In fact, Mr. Bryant has not caught hold of the principal link in the chain of Dr. Priestley's argument; nor does he appear to have availed himself, in the least degree, of the lights which he might have derived from a perufal of the writings of Dr. Priestley's preceding opponents on this subject. We know not whether we shall throw any new light on this branch. of the argument by just observing, that the defenders of the doctrine of philosophical liberty consider the will as an uncontrolled agent, and as the beginner of motion > whereas the will, at the same time that it is active with respect to the exertions of the mind and body, is, according to the Necessarian doctrine, palive with regard to the motives that determine it; the strongelt of which does, and must prevail. Though it has been said, that activity and passiveness are incompatible in the same subject; yet there appears to us no contradiction in conceiving a thing as an agent, or as acting upon one substance, in one particular manner, while itself is acted upon by another substance, in another manner:-in the same way as the heart is an agent, in propelling the blood through the arterial fystem; and accordingly is populaily confidered as the original cause of all the vital motions: while, at the same time, it is passive in obeying the nervous influence, from which, in fact, it derives its activity. The The Reader perhaps will be better enabled to judge of Mr. Bryant's fitness to enter the lists, on this particular question, against so formidable an opponent; and of Dr. Priestley's manaer of repelling the seeble attack, with a push of his little finger; if we transcribe two or three passages noticed by Dr. Priestley, which occur towards the beginning of Mr. Bryant's Address, and annex the Doctor's observations on them.

Mr. Bryant says, that 'upon the most diligent inquiry, he is persuaded that mankind have a self-determining power; and that, upon mature deliberation, and just reasoning, they can make a free and proper election, and can not only chuse, but reject,

as shall seem best to their own judgment.'

But pray, good Sir,' fays Dr. P. in answer, 'did any Necessarian ever deny this? If he did, he must have been such a defender of necessity, as you are of liberty. A Necessarian is so far from denying this, that his principles absolutely require it. For, according to them, something that may be called judgment necessarily precedes volition, and the volition is always directed by that judgment, being determined by what to it appears preserable at the time.'

Again, 'who ever afferted,' fays Mr. B. 'that the mind was never under any influence, and that the will was not determined by motives?'—What,' answers Dr. P. 'could any Necessarian fay more to his own purpose? For my own part, I cannot express my own principles in more proper, or more decisive lan-

guage.

The great question, Mr. B. afterwards adds, is, 'whether these motives are coercive: whether this influence be irresistible; so that the mind has no power of election, and cannot by any means reject.—You will tell me, that this is owing to a stronger motive, which overcomes the weaker. This I shall not controvert.'—Then, says Dr. Priessley, 'let me tell you, Sir, there is nothing in the whole business that you can controvert, that

will be to any purpose.'

Mr. B. immediately subjoins—'All I know is, that whatever influences there may be, we are blessed with reason, to consider and to judge; and with a power to reject and to chuse.'—But does any Necessarian, Dr. Priessley replies, 'deny that man is endued with reason? So far is he from denying that consideration and judgment precede volition, and direct it, that this is the very circumstance that his scheme requires, in order to exclude self-determination, which it effectually does. Indeed, Sir, here you are got upon clear Necessarian ground; though, being unfortunately bewildered, as you truly say of yourself, you know not where you are.'

Towards the end of his Address, Mr. Bryant, after relating the opinion of Cicero with respect to the controversy between Chrysippus

À

Chrysippus and his opponents, subjoins—6 so that, contrary to your (Dr. P.'s) notion, a thing which at any time happened, might have happened otherwise, if we had chosen it.'- Now, this also, says Dr. P. is so far from being contrary to my notion, as you call it, that it is perfectly agreeable to my notion. For it implies, that, to have happened otherwise, a different choice must have been made; and you are as far as I can be from suppoling that choice is not determined by motives.'

These short extracts sufficiently show how unprepared Mr. Bryant was to engage in this controversy. We shall, however, transcribe a longer extract from his performance; as a specimen of one of the Author's arguments, or rather of his oratory, in favour of the felf-determining power ascribed to man, by the advocates for liberty. Before our philosophical Readers have got to the end of it, they will wonder that the Author should have overlooked the extensive influence of the principle of afforciation; noticed fo long ago by Locke, and fince fo extensively and successfully employed, in investigating the theory of the human mind, by many metaphyfical writers, and particularly by Hartley.

Addressing himself to Dr. Priestley, Mr. Bryant says- You indeed tell me, Sir, that every thought is predetermined: and in every act of volition I am forcibly impelled: fo that I could not in any instance have made my election otherwise than I have done. Every movement of the mind, you say [Locke had said this, not Dr. P.], 'arises from a pressing uneasiness. This theory may appear specious; but it seems to run counter to all experience: and the contrary, if I mistake not, is self-evident. I fit at this instant at my ease, in a calm and dispassionate state of mind; as you are pleased, Sir, to recommend. I perceive myself at full liberty, and know not of any external impulse to determine me either in my thoughts or actions. purpose to move: but antecedently examine, whether I am under any bias, or necessity: or directed by any foreign power. I find none. In the vast series of causes, so often mentioned, I do not perceive one, that will have any share in the effect which I am about to produce. The whole originates in myself, whether I move my body; or my arm; or am content with extending a finger. The like appears with respect to my thoughts. I am here equally free; and among the various objects which are ready at my call, I arbitrarily chuse those to which my fancy leads me. You tell me, that every thought is an effect; and that it is connected with a prior idea, by which it was produced. I cannot see any such uniform affinity or correspondence: and to give a proof of my liberty and independence, I will for once expatiate freely, and produce a series of unconnected ideas from my own imagination. I accordingly, without any pressing unealiness,

easiness, think of a tree; of time; of the ocean; of darkness; of a cone; of truth; of a tower; of probability; of Thersites; of love; of Epidaurus; of Socrates; of a mite; of casuistry; of the Iliad; of Otabeite; of Tenterden fleeple;'-[we rather wonder Goodwin sands did not here slip in, instead of what follows it] of a mole; of a monse-trap. In doing this, I did not find that I was restrained by any law of nature; or impelled by any foreign power. Nor can I at last perceive that these desultory thoughts have the least connection with one another: much less with any prior ideas. You affure me, that they must unavoidably have a reference, and that they are dependent upon others, which have preceded. In short, according to your principles, they arole fo necessarily in my mind, that five days hence, or five years hence, in the same circumstances, and with the same disposition, I should infallibly make the very same choice. But this feems contrary to experience: for though I am as precifely in the same circumstances as we can suppose any man to be; and likewise in the same disposition of mind; yet, after an interval of a very few minutes, I am not able to go over the fourth part of this feries. And however cogent the necessity may be, I can recollect very little more than the mole and the moule.

The philosophical Reader will anticipate the substance of Dr. Priestley's reply to this studied slourish of Mr. Bryant's—— 'You think, Sir,' says he, 'that the curious assortment of ideas you have presented us with had no connection, mediate, you must mean, or immediate. But odd as you, who appear to know so little of the human mind, may think it, I have no doubt but they really had. Are you sure, that you have omitted no other ideas, that might connect those that you have produced? Or, which you may better recollect, did you at first set them down exactly in the order in which they now stand? Were not the words, love and a tower, a little nearer together; and did not the story of Hero and Leander occur to you: and are you quite sure that nothing squeezed in between the mole and the mouse-trap?

You say, you place yourself as precisely in the same circumstances as we can suppose any man to be, and likewise in the same disposition of mind. But, Sir, what you may suppose to be the same, may not be precisely so; and a very slight alteration in the disposition of your mind, perhaps the position of your body, may put the mole in the place of the meuse-trap, or vice versa.

'That you have never read Mr. Hobbes, I take for granted. Indeed, if you had, you would have known a little more of the subject of which you treat than you now do. Somewhere in his writings, but I do not now recollect the place, you would

have found a pertinent observation to the present purpose, and a proper example. Some gentlemen were talking of the Civil wars in England, when one of them suddenly asked what was the value of a Jewish shekel. To appearance, these had as little connection as any two in your group. But this gentleman was more ingenuous, or more fortunate than you: for, being interrogated while the whole train was fresh in his memory, he said, the Civil war brought to his mind the death of King Charles, the death of Charles that of our Saviour, and this made him think of the thirty pieces of silver, which he supposed were shekels, for which Judas betrayed him. Now all this process might take place in less time than would be sufficient to write down any of the two words in your collection. But you feem to have no idea of the rapidity of thought, or how flight circumstances are fufficient, by the law of affociation, to introduce any particular idea. And yet the connection of the several parts of your ingenious System of Mythology is often extremely delicate.

Having already said enough of this performance, we shall not extend this article by dwelling on the gross and indecent personal imputations and infinuations, which Mr. B. has in different places thrown out against Dr. P. as a man, and as a professor of Christianity; and for which he is severely, and, in our opinion, very properly reprehended.

In the first of these two performances, Dr. Priestley meets an antagonist of a different order from the preceding;—we mean, however, only with respect to this subject. His present opponent is fully master of the question in debate; and has met him before on the same ground. When engaged with such antagonists as Dr. Price and Mr. Palmer, he has the statisfaction in arenam cum æqualibus descendere.

Though we entered pretty largely [in our Review for January last, pag. 28.] into the contest between Dr. Priestley and Mr. Palmer, on the doctrine of Philosophical Necessity; we find it difficult to continue the discussion of the different subjects, not very methodically treated in Mr. Palmer's second performance now before us, without endless repetitions and references. We think it sufficient, therefore, to refer the Reader to the performances themselves; taking particular notice only of some parts of Rev. Nov. 1780.

ART. VI. An Appendix to the Observations in Defence of the Liberty of Man, as a Moral Agent; in Answer to Dr. Priestley's Illustrations of Philosophical Necessity, &c. By John Palmer, Minister of New Broad-street. 8vo. 6 d. Johnson. 1780.

ART. VII. A Second Letter to the Rew. Mr. John Palmer, in Defence of the Doctrine of Philosophical Necessity. By Joseph Prientley, LL. D. F. R. S. 8vo. 6 d. Johnson. 1780.

Dr. Priestley's last section, in which, as well as elsewhere, though Mr. Palmer has expressed his intention of declining the controversy, Dr. Priestley with some earnestness invites him to resume it; and proposes to him the consideration of certain points, to which he thinks he has omitted to give a satisfactory answer. The first of these appears to be of sufficient importance to merit transcription.

Mr. Palmer had faid, that a determination of the mind is not on effect without a cause, though it be not produced by any motive; because the self-determining power itself is the sause. Dr. Priestley had answered, that, allowing this supposed power to be the cause of choice in general, it can no more be considered as the cause of any particular choice, than the motion of the air in general can be faid to be the cause of any particular wind; because all winds are equally motions of the air, and that therefore there must be some farther cause of any particular wind. 'I desire you,' says Dr. Priestley, 'to point out the insufficiency of this answer. This it the more behoves you to do, because it respects not the outworks, but the very inmest retreat of your doctrine of liberty. If you cannot defend yourself against this attack, you must surrender at discretion. Necessity, with all its borrid consequences, will enter in at the breachts and you know that Necessarians, though sothful to good, are active enough in milchief, and give no quarter."---Dr. P. here alludes to Mr. Palmer's having before faid, that a belief in the doctrine of necessity tended to indispose a man for wirtuous activity; though it would not prevent his being active enough in gratifying his vicious inclinations.

Returning to the same subject afterwards, Dr. P. desires Mr. Palmer to produce some direct proof of the existence of the self-determining power he boasts so much of. I mean, says he, a proof from said, and not from a merely imagined seeling, or consciousness of it, which one person may affert, and another, who is certainly constituted in the same manner, may deny. What I affert is, that all we can feel, or be conscious of, in the case, is, that our actions, corporeal or mental, depend upon our will, or pleasure; but to say, that our wills are not always influenced by motives, is so far from being agreeable, that it is directly contrary to all experience in ourselves, and all observation of others.'

We have observed in our Article above referred to [M. R. January, 1780, pag. 35.], that Mr. Palmer, in his zeal for human liberty, in fact gives up the Divine prescience. On this head Dr. Priestley presses him very strongly. You have said nothing (says he) to explain or soften your denial of the doctrine of Divine prescience, which, as a Christian, and a Christian Minister, it greatly behaves you to do. You pretend to be shocked at the consequences of the doctrine of necessity, which

Rixs

exist only in your own imagination; but here is a consequence of your doctrine of liberty, directly repugnant to the whole tenor of revelation, as it has been understood by all who ever pretended to any faith in it; though they have differed ever so much in other things. It will be well worth your while to make another Appendix to your book, if it were only to give some little plausibility to this business; and either to shew, if you can, that the Divine prescience is not a doctrine of the Scriptures, or that the sacred writers were mistaken with respect to it."

If, as I suppose will be the case, you should not be able to reconcile prescience with your more savourite doctrine of free-will; be advised by me, rather than give up the former so lightly as you do, to keep it at all events: even though, in order to do it, you should be obliged to rank it (as many truly pious Christians do the doctrines of Transubstantiation, and the Trinity) among the mysteries of faith, things to be held sacred, and not to be submitted to rational inquiry. On no account would I abandon such a doctrine as that of Divine prescience, while I retained the least respect for revelation, or wished to look with any satisfaction on the moral government under which I live."

There are some other material points which Dr. P. strongly urges Mr. Palmer to reconsider; at the same time he entreats him with considerable earnestness to carry on this controversy a little longer, and to its proper conclusion; particularly proposing the mode of discussing the points in debate by distinct interrogatories, and categorical answers, in which each of them may exhaust all that they can now have to say that is material. I am so happy, says he, 'to find myself engaged with a person of undoubted judgment in the controversy, that, I own, I am very unwilling to part with you soon. I shall be like Horace's friend, and you must have recourse to as many shifts to get quit of me.'

of the two former volumes of this work we have already given an account in the course of our Journal \*; and we

ART. VIII. The Canadian Freshelder: In Three Dialogues between an Englishman and a Frenchman, settled in Canada, shewing the Sentiments of the Bulk of the Freeholders of Canada concerning the late Quebec Act; with some Remarks on the Boston-Charter Act; and an Attempt to shew the great Expediency of immediately repealing both those Acts of Parliament, and of making some other useful Regulations and Concessions to his Majesty's American Subjects, as a Ground for a Reconciliation with the United Colonies in America. Vol. III. 8vo. 4s. 6 d. Boards. White: 1779.

Vols. 57, 58, and 61.

now proceed to a review of this additional volume, which comprehends the Third Dialogue. The Writer now gives the remaining part of his plan of reconciliation between Great Britain and her American Colonies, which was begun in the First Dialogue. The Author proposed, that the Quebec Act should be repealed; that satisfaction should be given to the Americans with respect to the important article of taxation by authority of the British Parliament, by promising not to tax them by that authority till they shall be permitted to send representatives to the British House of Commons; that satisfaction should also be given them with respect to the security of their charters for the time to come, by promising them, by resolutions of both Houses of Parliament, or by an act of Parliament to be passed for that purpole, that for the suture no changes shall be made in any of their charters, without either a petition from the Affembly of the province whose charter is proposed to be altered, desiring that some alterations may be made in it, or a complaint before the Parliament of Great Britain of abuses of the powers and privileges contained in the faid charter, and a hearing of the Agents and Council of the faid province in their defence against fuch complaint; and that the feveral offices of Civil government in the provinces of America should be put under some new regulations. Other particulars are mentioned; but it is the less necoffary to enumerate them here, because fundry events have happened fince the first publication of the Canadian Freeholder, which have rendered extremely hopeless any such plan of reconciliation as that proposed by this Author. But notwithstanding this, many of his observations, and accounts of transactions in America, well deserve the attention of the inquisitive Reader.

One measure recommended by him is, to take the proper means for 'removing from the minds of the Americans the apprehensions they have hitherto entertained of having Bishops established among them by authority of the King or Parliament of Great Britain, without the consent of their own Assemblies.' On this subject our Author is very copious. He gives a particular account 'of the state of religion in America, and the endeavours who thave been made at sundry times, by the partisans of Episcopacy in these provinces, to obtrude their mode of Church government and divine worship upon those of a diffe-

rent pertuafion.'

He observes, that 'the people of several of the English colonies in North America are dissenters from the Episcopal Church of England, and are either Presbyterians, or Independents, or Quakers, or followers of some other sect, or mode, of the Protestant religion that is adverse to Episcopal government. This is more especially the case with the sour provinces of New England, to wit, Connecticut, Rhode Island, Mussachusets Bay, and New Hampshire.

The Englishmen who first settled these countries, went thicker about the year 1630, during the tyrannical part of the reign of King Charles I. on purpose to avoid the severities they were then exposed to from the Bishops of England, though Protestants, and with a view to follow and establish their own mode of worshipping the Supreme Being, which they conceived to be purer (as they expressed it), and more agreeable to the amplicity of the Gospel and the practice of the primitive Christians, than that which was adopted by the Church of England. For the liberty of worshipping God in their own manner could not at that time be enjoyed by them in England; the mode of worship adopted by the Church of England being then prescribed and enforced with a high hand upon all the subjects of the Crown, without any allowance of any other, even to Protestant Diffenters. From this original dislike to Bishops in the first settlers of these province. arising from the hard treatment they had suffered from them, it is easy to conceive that their descendants may have retained a strong prejudice against that order of clergymen, and a dread of falling under their authority. And this has really been the case, and in a very high degree: infomuch that nothing can be more alarming to this part of the King's American subjects, than the idea of falling back (to use their own expressions) under that Egyptian bondage. and that yoke of spiritual tyranny, from which their ancestors, with so much difficulty, spirit, and perseverance, had made themselves free; though with respect to all civil matters they greatly reverence and efteem the conflitution of the English government. These being the fentiments that prevail amongst them, one would have thought that common prudence should have induced the inhabitants of Great Britain never to touch upon the string of Episcopacy with them, for fear of exching those notes of discord which it had formerly produced among their ancestors before they went from England to America, and which it was next to certain it would produce again amongit them as foon as it should be put in motion. And it must be confeffed, in justice to the various sets of ministers of state that have directed the government of England for more than a century after the refloration of monarchical government in the year 160c, and more especially since the happy revolution in 1688; I say, it must be conselled that few or no attempts have been made by the government of England to thwart the sentiments of the Americans upon this subject by endeavouring to establish Bishops among them; but the Kings and Queens of England have been contented to leave the settlement of the affairs of religion in the American provinces to their respective legillatures, referving only to themselves and their governors the same power of allowing or disallowing the acts of the American Afsemblies made relating to it, as they exercised with respect to the acts made by the same legislatures concerning any other subjects. All that has been done by the mere authority of the Crown, for the accommodation of the Episcopalians of North America, has been to authorize the Bishop of London for the time being, to exercise Episcopal jurisdiction in those provinces by Commissaries to be appointed by him for that purpose, and who have been accordingly so appointed. And this, I believe, has given no umbrage to the Noaepiscopalians in those provinces.

But still it has, more than once, unfortunately happened, that some of the members of the Church of England in these colonies have not been satisfied with this delegated exertion of Episcopal anthority over them by the Bishop of London's Commissaries, but have been dearous to have a Bishop established and resident among them, and have even shewn great uneasiness at the want of one. have complained, on these occasions, that it was a great missormne to them to go without what they flyled the important benefit of Epifcopal confirmation, and that it was a cruel hardship upon their ministers to be obliged to cross the Atlantic ocean, and go to England, for the purpose of receiving holy orders from the English Bishops, by which some of them have died, either in their passage to England by the fatigues and dangers of the sea, or of the small-pox after their arrival there, and others have been put to more expence than their slender fortunes could conveniently bear: and for these and, perhaps, other such reasons, they have earnestly solicited the establishment of a bishop in America. These complaints have generally taken their rife from the suggestions of a few zealous clergymen of the Church of England settled in America, who probably wished to increase their own consequence in this country by obtaining so splendid a support to their party, which would feem to raise it above all the other religious parties, and be the means of exalting its members, or, at least, its ministers, to offices of dignity and power, And sometimes we may suppose these reverend gentlemen might flatter themselves with the hope that they themselves might be the happy persons whom the Crown would pitch upon to fill this new and lofty flation. But, whatever might be their motives to it, it is certain, that these complaints about the want of a Bishop in America have been principally set on foot by some clergymen of the Church of England reliding in it, and have been propagated by them amongst the laity of the same communion, who have sometimes been persuaded to join with them in complaining of this hardship. And what is most remarkable is, that these very zealous clergymen, who have found out this grievance for the Americans of the Episcopal communion, have been, for the most part, natives of England, and not of America; though, by their. seal for the spiritual welfare of the inhabitants of the latter country, one would be inclined to suppose they must have been born there. For, as to the principal clergymen of the Church of England in America, who have been born and bred in America (and who therefore feem to have the best right to judge of what is fit to be done in this matter for their own accommodation, and that of their several congregations), I have been well affured that they are in general very well contented with the present state of the Church of England in America, and with the exercise of the episcopal authority there by the Bishop of London's Commissaries in the manner I have already mentioned: and this is more particularly true of the American clergy in the provinces of Virginia and Maryland and South Carolina, in which the Church of England is legally established by acts of their respective legislatures, and in which the number of dissenters from the Church of England is greatly less than in the other colonies, . The

The complaints concerning the want of a Bishop in America have generally taken their rife from some clergymen of the Church of England, who have been born and bred in England, and, not meeting with preferment in their native country, have gone over to North America to exercise their profession in that country. These clergymen have been of two forts; either such, as have been invited to officiate there as ministers of particular congregations of the communion of the Church of England, or such as have gone thither as missionaries from a certain society in England, called The Society for. propagating the Gospel in foreign Parts, for the purpose (as has been pretended) of converting the Indians of this continent from Heathen-ism to the Christian and Protestant religion. But, though the clergymen of the latter class have been sent to America under pretence of furthering that pious and ofeful work, they have afailly employed their time and talents in a manner that had not the smallest relation to it, and to purposes that have rather had a mischievous than a beneficial tendency to the peace and happiness of these provinces. For instead of going amongst the Indians, and residing in their villages, and learning their languages, and endeavouring to infruct them in the truths of the Christian religion, they have generally fettled themselves in some of the most populous towns and districts of the cultivated parts of those provinces, which are inhabited only by Englishmen, or people who speak the English language, and have there employed themselves in converting Christians and Protestants from one mode of Christianity to another, that is, from the opinions entertained by the Presbyterians, and Independents, and Anabaptifis, and other diffenters from the Church of England, to the doctrines and discipline of that church: which I must needs consider as doing mischief instead of good in those provinces, inasmuch as it has tended so raise uncasinesses and diffensions amongst the inhabitants of them, and make them distatissed with the modes of Divine worship to which they had been accustomed from their youth, and in the practice of which they had lived virtuously and peaceably and in charity one with another.'---- And they have also done a differvice to Great Britain itself, by exciting amongst the Non-episcopalians in America an apprehension that the British government would, one day or other, at the folicitation of those very zealous missionaries, and their converts, supported by the interest of the Bishops that were their patrons in England, establish Episcopacy amongst them; -- an. apprehension which has a manifest tendency to weaken their attachment to the kingdom of Great Britain, and make them less disposed to continue in dependence on it.'

Our Author proceeds to support his representations on this subject by quotations from Dr. William Douglas's Historical and Political Summary of the British Settlements in North America, and Mr. Smith's History of New York. But some further particulars, which we shall select from this work, must

be deferred to a subsequent Review.

T.

ART. IX. The Chapter of Accidents: a Comedy, in Five Acts, as it is performed at the Theatre-Royal in the Hay-Market. Written by Miss Lee. 8vo. 1 s. 6 d. Cadell. 1780.

the avowed and oftensible parent of many other comedies in almost all modern languages; and as the Pagan deities, in casual encounters with mortal women, sometimes less the divine origin of their offspring unknown even to the mothers themselves, so we have here before us a drama drawn from the rich source of Terence, even without the consciousness of the ingenious authoress. Diderot has declared himself a warm admirer of Terence, whose Adelphi gave the canvas for the Pere de Famille. Miss Lee seized and enriched the canvas of Marmontel and Diderot; and thus by the Chapter of Accidents, and through various channels and strainers, has produced a new impression of the Adelphi.

Steele, in reverence to modern manners, reformed the Andrian of Terence, and converted the frail Glycerium into the virtuous Indiana. Miss Lee, in the free spirit of Terence and Nature, hazarded the design of introducing into the [modern] drama a semale heart, capable of frailty, but shuddering at vice, and PERHAPS sufficiently punished in her own seelings. A lover, whose error was likewise in his heart not head. Thus she speaks of these characters in her Preface; but we think they are more accurately, as well as humourously, described in Mr. Colman's

Prologue, as

a lady, and a lover So full of virtue, fome of it rans over !

The Cecilia of Miss Lee, frail and penitent; her Woodville, capable of reason, but enslaved by passion; are at least more interesting personages than the philosophical Bevil, and the virtuous Indiana. Woodville is a young gentleman, in the style of Terence, of the samily of Pamphilus and Æschinus. Cecilia is more dramatically displayed than the fallen semales of the Roman Comedy, or the rigid Indiana of the modern. How far the example may be warrantable on our stage, we will not determine; but we are not among those who censure the Author for exhibiting it. Her lapse and remorse certainly render the situation of Cecilia more theatrical. Indiana may wrap herself up in her own virtue, and with Touchstone's Audry, thank Heaven, that the gods have not made her poetical.

Governor Harcourt is a sprightly running from Diderot's Commendeur, who is lineally descended from Ference's Demea. The two Somersetshire servant, Jacob and Bridget, Jacob especially, have many natural and provincial seatures, very happily marked.

The rest of the Dramatis Persona, Grey excepted, marked.

have but little original excellence.

The title of The Chapter of Accidents is in some sort an apology for a romantic fable; we shall not therefore too severely examine the probability of the incidents. The dialogue, though not perfectly pure and natural, is often enlivened by humour, and ennobled by fentiment. The following scene is the first interview exhibited by our Author between Woodville and Cecilia:

## Enter Woodville.

" Wood. My Cecilia!-my foul!-have I at last the happiness of beholding you? You know me too well to imagine I would punish myself by a moment's voluntary delay.

· Cec. Oh, no; it is not that—(both fit down on the fopha)
· Wood. Say, you are glad to see me?—afford me one kind word.

to atone for your cold looks !- are you not well?

\* Cec. Rather fay I am not happy .- My dear Woodville, I am an altered being: why have you reduced me to shrink thus in your presence?-oh, why have you made me unworthy of yourself? (leans against bis shoulder weeping.)

" Wood. Cruel girl!—is this my welcome?—when did I appear

to think you fo?

Tell me, when any one else will think me otherwise? · Cec.

" Wood. Will you never be above so narrow a prejudice? are we not the whole world to each other? - nay, dry your tears! allow me to dry them; (kiffes ber cheek) what is there, in the reach of love or

wealth, I have not fought to make you happy?

\* Cic. That which is the essence of all enjoyments, -innocence :ch, Woodville, you knew not the value of the heart whose peace you have destroyed.—My sensibility first ruined my virtue, and then my repose,—But, though for you I consented to abandon an humble happy home, to embitter the age of my venerable father, and bear the contempt of the world, I can never support my own .- My heart revolts against my situation, and hourly bids me renounce a splendor, which only renders guilt more despicable. (Rises) I meant to explain this hereafter; but the agitation of my mind obliged me to lighten it immediately.

" Wood. Is your affection already extinct ? for fure it must, when

you can resolve to torture me thus.

" Cec. Were my love extinct, I might fink into a mean content:

-oh, no.—'Tis to that alone I owe my resolution.

Wood. Can you then plunge me into despair?—so young, so lovely too !- oh, where could you find so safe an asylum as my heart?

whither could you fly?

\*\* Cec I am obliged to you, Sir, for the question; but who is it has made me thus destitute?—I may retain your protection, indeed,

but at what a price!

Wood. Give me but a little time, my love !- I am equally perplexed between my father and my uncle; each of whom offers me a wife I can never love. Suffer them to defeat each other's schemes! -let me, if possible, he happy without a crime; for I must think it one, to grieve a parent hitherto so indulgent.—I will not put any thing in competition with your peace; and long for the hour when the errors of the lover will be absorbed in the merits of the husband.

Moodville! that was, when innocent, as far above my hopes, as it is now beyond my wishes.—I love you too fincerely to reap any advantage from so generous an error; yet you at once flatter and wound my heart, in allowing me worthy such a distinction: but love cannot subsit without esteem; and how should I possess yours, when I have lost even my own?

Wood. It is impossible you should ever lose either, while so deferving both.—I shall not be so easily denied hereaster, but am bound by the caprices of others at present.—I am obliged to return directly, but will hasten to you the very first moment; when we meet again,

it must be with a smile, remember.

\* Cec. It will, when we meet again.—Oh how those words oppress me! (aside) but do not regulate your conduct by mine, nor make me an argument with yourself, for disobeying my Lord; for here I solemnly swear, never to accept you without the joint-coasent of both our fathers; and that I consider as an eternal abjuration:—but, may the savoured woman you are to make happy, have all my love without my weakness!

[Exit in tears.

The candid Reader, we imagine, will agree with us, that Miss Lee has here managed a very nice circumstance with much address and delicacy. The third act rises in interest, and is indeed peculiarly excellent, most strictly verifying the promise in

the Prologue of

Passion and humour—los and sentiment.

The Prologue contains a handsome compliment to the memory of Goldsmith, and some shrewd strictures on common-place theatrical commentators, with which, though ourselves prosessed critics, we are not displeased. To the sollowing lines we are most partial:

Critics in vain declaim, and write, and rail:
Nature, eternal Nature! will prevail.
Give me the bard, who makes me laugh and cryo
Diverts and meyes, and all, I fearce know why!
Untaught by commentators, French or Dutch,
Passion still answers to the electric touch.
Reason, like Falstaff, claims, when all is done,
The honours of the field already won.

The Preface abounds with expressions of gratitude to Mr. Colman, and of resentment to Mr. Harris. Some acrimonious expressions relative to the last-mentioned gentleman, as well as to a certain judge, had in our opinion have been better omitted.

Genus irritabile watum !

ART.

## ART. X. Davies's Life of Garrick, CONCLUDED.

Nour Review for August, we gave, from the sources of information now before us, confirmed by our personal knowledge of the man, a general view of Mr. Garrick's amiable private character. Our Readers there saw generosity and benevolence combined with prudence and wisdom; gaiety unmixed with folly; and pleasantry, that added much to the happiness of many, without giving pain to any individual—as wit too often does, when it meets with objects for the exercise of its talents—the push of its sharp point, and the stroke of its keen edge.

In the Review for September, we set out with our Hero on the great journey of Life; we accompanied him from the place of his birth to the metropolis of the kingdom; where we observed him balancing in his mind the means of his future fortune, and at length, under the guidance of Nature herself, striking into that peculiar path by which alone, perhaps, he could be led to success, and to the enjoyment of as great a share of continued prosperity as man can hope to meet with, in this 'empire

of vicitlitude.'

To follow Mr. Garrick in the high career of his professional progress, and to point out the various steps by which he attained the summit of theatrical glory, were not only superstuous, but improper, in a Review of his History, wherein brevity must be chiefly consulted. It only, therefore, remains for us to apprize our Readers, in sew words, of the variety of entertainment which they will meet with in the volumes before us—exclusive of those incidents, observations, and criticisms, which immediately relate to the life, the character, and the inimitable performances of the British Roscius. For,

This work is not merely the biography of David Garrick; it is likewise, as the title-page honestly sets forth, the history of his theatrical contemporaries, interspersed with 'characters and anecdotes,' and forming, in the whole, 'a history of the stage,' including a period of thirty-six years:—an history that, with all due deserence to the merit of Mr. Victor's Collections, was wanting, as a continuation of Colley Cibber's very entertaining performance—which he, with unusual modesty, entitled, an Apalogy for his own Life. Nor would, in our opinion, the good taste of Mr. Cibber (were he still living) be at all offended by the style or the remarks of his present continuator.

Mr. Davies introduces the theatrical part of his Hero's history, with the characters of the most eminent actors in tragedy on the English stage, at the time when Mr. G. commenced player. Among these were Booth, Wilkes, Cibber, and Quin: for

even Cibber, who has been chiefly celebrated for his comic exhibitions (in the various extent of which, our author observes, he held no equal), was much celebrated for fome parts in tragedy, for Richard III. for Iago, and Cardinal Wolfey. Ryan also figures in this group; with Walker, the original Macheath, Milward, Delane, Hippisley, &c.

Of Cibber's prejudices in favour of the old modes of acting, which Nature and Garrick conspired to banish from the theatre,

Mr. Davies gives us the following pleafant instance:

' Colley Cibber, from whom more candour might have been expected, after he had seen Garrick's Bays, which the public esteemed a matter piece of comic humour, faid, "Garrick was well enough, but not superior to his son Theophilus, who had little more to recom-

mend him in the part than pertners and vivacity."

' Mrs. Bracegirdle, a celebrated actress, who had left the stage for more than thirty years before Garrick's first appearance, and was visited by many persons of condition and take, thought very differently of this rising genius. In a conversation which she had with Colley Cibber, who spoke of him with an affected derogation, she reproved his malignity, and generoully faid, " Come, come, Cibber, tell me, if there is not something like envy in your character of this young gentleman. The actor who pleases every body must be a man of merit." The old man felt the force of this sensible rebuke; he took a pinch of fnuff, and frankly replied; "Wny faith, Bracey, I believe you are right—The young fellow is clever."

Thus it is, generally, with age! jealous of all innovations, and apt to look upon every new mode, nay, even the greatest improvements, with a jaundiced eye! — But Mrs. Bracegirdle, we see, to her great honour, was not of that autumnal com-

plexion.

Quin was still more piqued at the adoration that was paid to the rifing Sun. He declared, " that if the young fellow was right, He, and the rest of the players, had all been wrong."

On being told that Goodman's Fields theatre was crowded every night to see the new actor, he said, "That Garrick was a new religion: Whitefield was followed for a time; but they would all come to church again."

Mr. Garrick, who had a quick and happy talent in turning an epigram, gave this smart teply to Quin's bon mot:
Pope Quin, who damns all churches but his own,

Complains that herefy corrupts the town: Schism, he cries, has turn'd the nation's brain; But eyes will open, and to church again! 'Thou great in allible, forbear to roar, Thy bulls and errors are rever'd no more; When ductrines meet with general approbation,

It is not herefy, but reformation.'

Our author has interspersed throughout his Memoirs, a varicty of anecdotes and entertaining particulars relative to Quin; who, after reigning many years absolute monarch of the stage, was obliged, reluctantly, to abdicate the throne, and leave " the young fellow" in quiet possession of it; convinced, at length, that Garrick was " right, and that the rest of the players had all been wrong."-Time, however, enabled him to get the better of his chagrin. He even grew fond of "little Davy!" and Davy conceived a very fincere regard for Quin; who, indeed, possessed virtues which commanded the esteem of those who intimately knew him. —And here it is natural to recollect the epitaph written by Garrick for his great predecessor, which is engraven on the monument erected to the memory of Mr. Quin, in the abbey-church at Bath : an epitaph which, substituting the initials D. G. instead of ' James Quin,' would be equally applicable to the writer.

That tongue which fet the table on a roar. And charm'd the public ear, is heard no more: Clos'd are those eyes, the harbingers of wit, Which spake before the tongue what Shakespeare writ: Cold is that hand, which, living, was stretch d forth At Friendship's call, to succour modest worth. Here lies James Quin-Deign, reader, to be taught, Whate'er thy strength of body, force of thought; In Nature's happiell mold however cast, To this complexion thou must come at last.'

We shall now briefly follow our author through the remaining contents of his work; of which we can only note the general heads.

In the first volume, in tracing Mr. Garrick's progress to the temple of Fame, and the temple of Plutus, he recites his quitting the theatre in Goodman's Fields; his agreement with the patentee of Drury-Lane house; his expedition to Dublin (where his fuccess on the stage exceeded all imagination); his return to London; and the great figure he made on the English theatre. These details are accompanied with critical remarks on his principal parts, particularly those highly contrasted characters, Hamlet and Abel Drugger.

In the 9th chapter we have the particulars of Mr. G.'s fecond voyage to Dublin, where, in 1744, he became joint manager with Mr. Sheridan: and here too we have an account of the first acting of Mr. Barry, the great rival of Mr. Garrick, whose merits are justly appreciated in these Memoirs.—On Mr. Garrick's return to England, in 1746, he appeared on the theatre in Covent-Garden, and shared the profits with Mr. Rich

Chap. X. gives the history of a great revolution in the theatrical world; Garrick, Quin, Mrs. Cibber, and Mrs. Pritchard, at Covent-Garden: what a constellation! and Barry, Woffington, Macklin, and Clive, at Drury-Lane. - When will a London audience behold the like again? - Our author relates the different

different success of the theatres, and gives the characters of Fleet-wood, Rich, and Lacy, the patentees. He also acquaints us with the rise of pantomime entertainments, of which Mr. Rich was the Garrick.

In the next chapter, our hero becoming, with Mr. Laey, joint patentee of Drury-Lane theatre, Mr. Garrick, at opening the house, spoke the celebrated prologue, written on this occa-fion, by Mr. Samuel Johnson. This piece naturally finds a

place in the chapter before us.

The incidents, the anecdotes, and observations, comprehended in this history, now rise in dignity and importance. The competition between the two Theatres-Royal grew warm indeed; but at length the genius and fortune of Garrick prevailed. Poets, as well as actors, of the first reputation, at this time filled the scene; Mr. Johnson's Irene is given to the public; and the samous Mr. Aaron Hill figures both as a dramatic writer and a manager. We have here a particular account of this singular genius, to whose respectable character Mr. Davies seems to have done perfect justice.

The other dramatic writers who are celebrated in this work, beside Mr. Garrick himself, who has justly acquired considerable reputation in this walk of literature, are Mallet, Thomson, Browne (the estimator); Murphy, Home, Shirley, Fielding, Smollet, Ralph, Coleman, Whitehead, Cumberland, Kelly, Goldsmith, Mrs. Griffith, Mrs. Hannah More,—and particularly, though not properly a dramatic poet, Charles Churchill, whose famous satire the Rosciad could not but, in course, introduce him to a considerable place in these Memoirs. The various success of their several productions is particularly related; and the Writer's observations on their respective merits are pertinent and judicious.

Mr. Foote is here likewise celebrated, both as author and actor. He was well known to our stage historian; and the particulars which he relates concerning that graceless son of humour, and his performances, cannot fail of agreeably gratifying

the curiofity of his readers.

Beside the players already mentioned, here are memoirs relating to Messers. Dexter, Ross, Mossop, Havard, Powell, Holland, Weston, King—Mrs. Yates, Mrs. Abington, &c. &c. —The first volume brings Mr. Garrick's history down to the commencement of the present reign.

In the three first chapters of the second volume, Mr. Davies continues his narrative of theatrical transactions, till the year 1763, toward the close of which Mr. Garrick set out on his journey to Italy; his chief motives for which are thus explained by our author:

' Mr. Garrick had long meditated a journey to the continent; and I cannot but suppose, that the several disagreeable occurrences which

attended the last year of his management, had contributed to quicken his resolution of leaving for a time his native country. His own, and Mrs. Garrick's health, were not so firm as their friends and the public withed. The baths of Padua were celebrated for their healing power in certain disorders, and pronounced efficacious in Mrs. Garrick's case. Exercise, amusement and change of air were what her husband feemed principally to want. To a mind active and inquisitive, such as Mr. Garrick's, the knowledge of foreign customs would afford instruction as well as entertainment. The theatres on the continent, with their multifarious exhibitions, might, in all probability, furnish him with proper materials to enrich his own dominions on his return home. His inclination to travel might gain additional strength from two other motives, very incidental to the human breaft; the defire of increasing his importance, by not being so often feen; and convincing the public, that the fuccess and splendour of the stage depended solely on himself. He set out for Dover, in his way to Calais, the 15th of September, 1763, accompanied by Mrs. Garrick.

In the next chapter, which is the thirty-third of the work, we have the history of the stage during Mr. Garrick's absence; including the introduction of Mr. Powell to the theatre, under

the auspices of Mr. Colman and Mr. Lacy.

The thirty-fourth chapter gives an account of Mr. Garrick's entertainment in France and Italy, where he was careffed by the most illustrious princes, and persons of the first distinction of both sexes.

The thirty-fifth chapter continues Mr. Davies's view of the flate of the theatre during Mr. Garrick's absence; and in the thirty-faxth we again behold, on his own theatre, the savourite of the age. On the first night of his public appearance, he addressed the audience in a prologue, which he wrote for the occasion, and which he delivered with so much humour and pleasantry, that he was obliged to speak it for ten successive nights, amidst such loud and repeated applauses, as no actor, perhaps, was ever welcomed with before.

The next thirteen chapters continue the history of the stage, of actors, and of poets; including a sketch of the lives and deaths of Mr. Kelly, Dr. Goldsmith, Messrs. Quin, Barry, Mossop, Havard—Mrs. Clive, Mrs. Pritchard, &c. also a particular ac-

count of Mr. Cumberland and Mr. Foote.

Chapter XLIX. brings us to that period of Mr. Garrick's history, when, by the death of Mr. Lacy, he became sole manager, viz. in the year 1773. He was now advanced to within a few years of fixty. 'He had been,' our author observes, much afflicted with chronical disorders, sometimes with the gout,—but more often with the stone and gravel, which never left him without an unkind token of a speedy return.'—He didnot, however, finish his dramatic race till the year 1776; when, after performing Don Felix in the Wonder, he took his leave of the

the audience, in a manner so pathetic and tender, as could not fail of powerfully exciting both the tears and acclamations of a

most crowded and brilliant assembly.

The fifty-second chapter carries on the narrative of Mr. Gatrick's life, after his disposal of his property in Drury-Lane theatre, to the beginning of the year 1779, when, to the great grief of his very numerous friends, and his innumerable admirers, he died at his house in the Adelphi. He was interred, with extraordinary magnificence, on the 1st of February, in Westminster Abbey, near the monument of his beloved Shakespeare.

Our biographer concludes with a view of Mr. Garrick's general character; in which we have an estimate of his theatrical talents, compared with those of the greatest performers, either of his own age, or of former times; from the immortal Roscius, down to Wilkes, Booth, and Baron. In this parallel, Mr. Garrick's fame suffers no diminution; and we think that Mr. Davies has, by his comparative observations, demonstrated his tho-

rough acquaintance with the subject.

Of Mr. Garrick's character \* in private life, we have already spoken at large, in the first part of our account of these Memoirs. We shall now, therefore, take leave of a work which we have not regarded as an object of criticism, but as a fund of agreeable amusement, and interesting information:—for which the ingenious Author is entitled to our bearty acknowledgement.

• We must not forget to observe, that in this work, too, we have an account of the share which this benevolent man bore in the establishment and endowment of the Fund for the support of decayed Actors.

ART. XI. Midnight the Signal. In Six Letters to a Lady of Quality. 12mo. 2 Vols. 5 s. fewed. Dodsley.

THE evil which this Letter-writer has undertaken to reprove, is of confiderable magnitude; and the fervency and intensences of his zeal are every way proportionable to the copiousness of his subject. Whatever has the least tendency to prove, the perniciousness of late hours, either with respect to prudence, health, or virtue, is here enumerated and examined in almost every possible point of view. It is but justice to this Author to acknowledge, that he seems to write, whatever may be his opinions, not only from his immediate feelings, but also under the strongest conviction of the truth of what he has advanced. Nevertheless, it is to be feared, he only fights as one that beateth the air. By this remark we mean not, however, to infinuate that this well-intended, and, let us add, not ill-executed, attempt is any otherwise feeble, than as the enormity, which

which it is meant to oppose, is invincible. It is to be doubted, whether even the eloquence of angels could influence the conduct of fashion: submiffive only to the dictates of caprice, and inattentive to every remonstrance of truth or reason, she is truly the deaf adder that stoppeth her ears, refusing to hear the voice

of the charmer, charm he never so wisely.

The absurdity of devoting to pleasure and business those hours which nature intended for repose, and the reparation of animal life, is such as might arouse the indignation of a more phlegmatic moralist than the Writer of these Letters. The folly of this procrastinating humour, the offspring of indolence and luxury, and the fruitful parent of numberless disorders both of mind and body, he has painted in its true colours.

The following passages may serve as specimens both of the Writer's arguments, and of his manner of enforcing them:

An evil disposition may prevail in the mind; and evil deeds may accompany it, though we retire to rest with the sun. But there is a kind of heavenly temper in obeying the call of nature, expressed in good bours; and the contrary disposition appears in a striking point of

view, in those who run retrograde to this order of things.

' How strangely do we abuse the hours, by reversing their order! Even the business of government, as directed by the great council of the nation, now generally begins when it should end. In many countries abroad, where I have travelled, the public officers are at their business, nearly with the first appearance of the sun; and they consider, that, the sooner they have done their work, the sooner their hours of amusement will commence. I know of no country where bad

bours are so much the ton as with us.

The custom of bad bears has many pernicious effects. It revolts against common charity in respect to the welfare of others. Whence arise the disorders of domestic life? Come they not chiefly from bad bours? Hogarth has given us an admirable portrait of a morning, or rather a noon interview, between a fashionable pair, after a night's extravagance: but this expresses nothing of the scene, in the earliest part of the night, among the servants, male and semale, who are left at home, kept from their rest, unawed by the eye of master or mistress. It describes nothing that is passing abroad by master or mistress, coachman, footman, or chairman. What a scene of dissipation is spread around! If the ingenious artist had employed his pencil, if any pencil could reach the description,—what a display it would furnish!

Is not a great part of the bad principles, debaucheries, thefts, and infidelity found among many domeflics, owing to the bad bours kept by mailers and mistresses? Those who pass their days and nights in a manner so hurtful to themselves, act injuriously to the com-

munity.'-The custom of bad bours wounds the simplicity and purity of our manners! It is a departure from febriety, darkening the prospect of our comfort and peace; it so bewilders the understanding, we cannot discover what we mean, nor why we are so loft, as to act without a meaning.

I will prefume to tell you, that I had rather hear you were so illeadvised, as to retire to a number when you again go to France, then that you should submit to become a dupe to the ton, or accomplished.

in the art and myttery of squandering time.

If you should return next winter to visit this grand abode of every thing that is, and is not good; the fight of you, like the "conversation of a friend, will brighten my eyes;" but unless you resolve to revolt from the ton. I shall receive a more exalted confolation, in hearing that you are determined to slay in the North. Wherever you draw this vital air, seek for the friends of freedom of mind, detached from all party in f spicas, as well as politics, as your reason may dictate. Be manly, generous, and pious; fear God, and exercise your charity: but pay no service homage to dangenous or fantastical customs. Act up to your own true sense of right, and in good time you

will become an angel indeed!

You may be told, that things are not so bad as your old friend, represents them. I will venture to assure you, that several who are connected with my most intimate friends, are galloping through their estates, and others are running into perdition! Follies unheard of by their foresathers are daily committed. Subjects are guilty of imperial extravagancy; as if each could command the purse of the nation; and that this had no bottom. If it were proper, I could tell you of many, of whom your benignant heart has no suspicion, living on the verge of penury. I expect to see them fall, fall unpitied by those, whose example has been the cause of their ruin; and who, by infamous customs being grown callous to the sufferings of their own samilies, have no tears for the tale of another's woe! You will think this passing strange, and wondrons pitiful, but so it is!—Be on your guar.!!

Nor should you wonder, when I tell you, that such sad exents are happening, at a period when arta and refinements are carried to the most exalted height; and every thing which can adorn life, or render it pleasing, presents itself to our hands and eyes. But here, alas! the venom lurks! The fancy is awakened by a profuse variety of objects: the passions are instanced with a multiplicity of defires: and the votaries to felly ask no assistance from Heaven!—They seem abandoned to their destiny. Not having hearts to glorify the Giver of all good, they rather spurn at his bounty: in real deed they seek

their own misery.

"Your good heart may lead you to think, that moralifts expect too much; that is, more than reason and experience watrant, every age having furnished so much cause for complaint; but such are not able moralists. You will please to consider, that it is of little moment to compare times. Are we now very faulty, and shall we mend?—If we have less hypocristy than in some times past, I apprehend we abound more in impudence and insidelity. Our native simplicity and honest firmnes; our strong principles and courage, in maintaining truth, have given way to the ton. This abounding so much in frivolity and extravagance, we can boast but of sew manly qualities, and hardly leave ourselves language for the description of modern fallies.

In the whole catalogue of extravagant irregularities, late hours, or kad hours, frem to fland forth as both cause and effect. Bad hours

of rising; bad hours of meals; bad hours of business; bad hours of amusement; bad hours for rest.-This habit has created so procrastinating a humour, no good can come of it! This undisciplined flate, is, in effect, a contempt of time, unhinging the whole economy Time refents the affront; and many who might have been the friends and protectors of the correctors, feel the hour when they

are become incapable of doing any good to thumfelves.

" Custom is vulgarly denominated the law of fools; and it is their of those who act on no higher principle. What is the tan? It is law of these who act on no higher principle. not virtue, nor feafe; it is not prudence, ecenomy, nor religion : it is the costom of those who suffer themselves to be dupes to forms or modes of living, which have no foundation in reason or religion; and confequently no tendency to promote private or public virtue. Whatever militates against both these, puts the ax to the root of moral rectitude and national felicity.'

ART. XIL. A Discourse delivered to the Clargy of the Archdeacoury of Ely, on May the 9th and 10th, 1780. By Richard Watson, D. D. F. R. S. Regius Professor of Divinity in the University of Cambridge, and Archideacon of Efy. Cambridge printed, and fold by Rivington. 4to. 1s. 1780,

COME pert bandling of the Muses hath lately exerted all his I little talents of wit and humour, to throw a ridicule on the character and writings of Dr. Watson. But where wit bears no proportion to malice, and the vivacity of humour ' is ficklied o'er by the pale cast of Envy,' we feel disgust when the Author means to afford us diversion, and our estesm for Dr. Watson is only confirmed by those arts which have been made use of to depreciate his merit. - But we would not produce an abertion to the view of the public. Let that which 'dropped dead-born; from the press,' be buried where it fell!

The Discourse before us was delivered at Dr. W.'s primary The Author makes a modest apology archidiaconal visitation. for stepping out of the common track pursued on such occasions, and hopes his zeal for the interests of literature, and the honour of the university of Cambridge, will be admitted as a just plea, for the fingularity of his address. The capital object of it is the recommendation of the study of Oriental languages—the exp cellence and advantage of which our learned Author hath difplayed with a warmth and energy of address peculiar to himself, Why (fays the Doctor) should the fine talents of those who have a turn for languages, be for ever confined to the making a few. meagre additions to the learned labours of fuch as have gone before them, in publishing or commenting on the works of Greek and Roman authors, whilst the extensive field of Arabio, Person, and Chinese literature, remains unknown, or unemployed ?'---We yet know nothing, or next to nothing, of the treasures of Eastern learning; but from what we do know, there is no reason. B b 2

why we should be deterred from endeavouring to know more, Proverbs and poems have their graces and their uses; but from Eastern learning we derive more substantial benefits than what can be expected from such compositions. We owe algebra entirely to the Indians or Arabians; chymistry, medicine, natural history, and geography, and many of the most abstract sciences, are indebted to the Arabians, if not for their birth, at least for their support and protection, when they were abandoned by all the states of Europe. It is said, that the Arabians translated into their own language the most celebrated works of all other nations. If this be a fact, and the learned admit it as such, have we not great reason to believe that many monuments of Roman, Grecian, Egyptian, and Chaldean literature, may be preserved in the Arabic translations, though the originals may be irrecoverably lost? No language, not even the Grecian, after the conquests of Alexander, had ever so extensive a spread as the Arabic after the victories of Mahomet. - But I forbear to enlarge on a subject well known to you all, nor will I remind you of the utility of Oriental learning in the interpretation of Scripture, it being acknowledged, that the best commentators, either of ancient or modern times, from St. Jerome to the prefent Bishop of London, are those who have been the most conversant with Hebrew, and the other fifter tongues.

It is a work worthy the attention of all the universities of Europe, to undertake the translation of the Oriental manuscripts which we are at prefent possessed of. We have hundreds of volumes in our English libraries; France, Holfand, Italy, have many; and the library of the Escurial alone, if we may judge from the catalogues which have been lately published, would amply reward all our pains. Men skilled in these languages should be invited from every quarter, formed into a kind of society, and employed for life, under the direction of proper perfons, in the drudgery of translation. Nothing worth notice in this way can be expected from the detached labours of a few professors of Hebrew or Arabic. Men of liberal education cannot readily be brought to undertake fuch a task; and if they could, the matter may be effected at a much easier expence, by the labours of inferior persons. What would be an adequate reward for three or four needy Turks or Persians, would not be a proper stipend for one man of letters, who should be obliged annually to produce the fruits of his unremitted diligence.

But without entering into the particular manner of accomplishing this design, I cannot help being of opinion, that an infitution established at Cambridge, for the express purpose of translating and publishing Oriental manuscripts, would redound to the credit of the university, and tend to put the learned world in possession of a very valuable part of literature, of which at present

we have but a very imperfect knowledge. There is no reason to be alarmed at the difficulty of this undertaking, when we consider what the great industry of Dr. Kennicot hath effected, in collating the Hebrew manuscripts of the Old Testament: for if the ability of one man can do so much, what might not be expected from the joint abilities of a society of men, united into a body for the accomplishing one single object?

After expatiating on the importance of eastern literature, and its subserviency to the Mosaic records, especially with respect to. the universal deluge, and the common origin of the human race (illustrated more particularly in the striking similarity that prevailed between the ceremonies of the Egyptians and the Peruvians), the learned author concludes his Discourse, with briefly pointing out the means by which the object he so warmly recommends may be most effectually accomplished. A small fociety of proper persons (says he), part of whom should be employed at home in translating, and the other part in travelling to collect materials, would complete the business in half a century. The public expence attending the maintenance of such a fociety, would be but as a drop in the ocean, compared with. what is annually expended for less beneficial purposes. But without increasing the public burdens, by recurring to parliamentary liberality, we need have no fear of obtaining from royal munificence, or private benefaction, such aids, as, when added. to other resources which the university has a prospect of specdily possessing, would be sufficient for the purpose.

I hope no apology will be thought necessary for having ensered so fully into a literary subject, when it is considered that I am addressing a body of clergy, and that within the precincts of the University of Cambridge.

ART. XIII. PHILOSOPHICAL TRANSACTIONS, Vol. LXIX. For the Year 1779. Part II. 4to. 7 s. 6 d. Davis.

PAPERS relating to AIR:

Article 22. An Account of the Manner in which the Russians treat Persons affected by the Fumes of burning Charcoal, and other Efsuring of the same Nature: In a Letter from Matthew Guthrie, M. D. to Joseph Priestley, LL. D. F. R. S.

R. Guthrie observes, that a person who is exposed to the vapour issuing from burning charcoal, in the Russian stoves, falls into so sound a sleep, that it is difficult to awake him. This insidious poison excites no spasm in the trachea arteria, or lungs, capable of rousing him; nor does it appear that the breathing is particularly affected. In short, there is no one symptom of suffocation: but towards the end of the catastrophe, a kind of groaning is heard by people in the next room, which B b 3

confequently brings them to the relief of the sufferer. A person who only fits down in the room, without intention to sleep, is, after fome time, seized with a drowfiness, and inclination to vomit. If this warning be not attended to, and the person do not remove immediately, which his sleepiness often prevents him from doing, he is soon deprived of his senses, and the power of motion; and should he not be discovered within an hour after he has been in this state of insensibility, the attempts to restore him will not succeed.

The recovery is attempted by a method diametrically opposite, in one effential particular, to that which is used for the recovery of drowned persons, and which consists in the application of heat; whereas, in the case before us, the patient is laid naked upon the snow, his stomach and temples are well rubbed with it, and cold water or milk is poured down his throat. The friction is continued with sresh snow, till the livid hue, which the body had acquired in the close chamber, disappears, and the skin assumes its natural colour. Accordingly, when life is restored, the patients body is much colder than when he was brought out of the room, and he awakes cold and shivering.

Article 24. Experiments and Observations on the inflammable Air breathed by various Animals. By the Abbé Fontana.

In this paper the Abbé Fontana fully establishes the deleterious quality of inflammable air, procured from metals, which had been contested by that very ingenious chemist, M. Scheele; and shews the circumstances by which Mr. Schoole was led to conclude that this kind of air was not noxious to animals. In one of his trials, the Abbé was on the point of falling a martyr to this question, after having made only three inspirations from a large quantity of inflammable air contained in a bladder. After the first inspiration, he selt a great oppression on his lungs: during the second, he became pale, and objects appeared confused: but on the third, his strength failed him, he lost his fight entirely, and fell upon his knees; nor did he perfectly recover from the difficult and painful respiration which succeeded this dangerous experiment, till the next day. It is to be observed, that previous to the experiment, he had made a very violent expiration, in order to evacuate his lungs, as much as possible, of the atmospheric air contained in them.

The nature of inflammable air is very little known. A curious observation of the Abbe's, relating to it, may possibly surnish some hints with respect to the analysis of it. He has observed, that when the inflammable air produced from iron and zinc is kindled, a kind of parks or explosions, of a vivid colour, may be perceived in the body of the slame, darting from thence in every direction. They resemble those emitted from red-hot iron; or from small ignited grains of gunpowder, supposing

possing them to be kindled successively, and not attended with smoke. This phenomenon seems to form a distinctive character between the inflammable air of metals, and that of animal or vegetable substances; as the Author never sound the latter to sparkle like the air produced from the metals. The inflammable air of metals, when shook in water, so as to be partially decomposed, and to become less inflammable, proportionally loses its sparkling property: and when the process has been so long continued, that the air has become scarcely inflammable, it no longer emits any sparks. The principle, therefore, to which these sparks are owing, may probably be best discovered in the water in which the inflammable air has been agitated.

Article 26. Account of a new Kind of inflammable Air or Goss, which can be made in a Moment without Apparatus, &c. together with a new Theory of Gunpowder: By John Ingen-house,

F. R. S. &c.

We have already, in our review of Dr. Priestley's last volume of Philosophical Experiments \*, given an account of Dr. Ingenhousz's discovery respecting the elastic and inflammable air, or rather vapour, into which vitriolic æther is resolved, and which produces a very strong explosion when mixed with atmospheric or dephlogifticated air, and kindled. According to the Author's theory of gunpowder, the explosive force of that substance is owing to the almost instantaneous extrication of the great quantity of elastic sluids, which; before the conflagration, existed in a folid or condensed state, in the two principal ingredients, the nitre and the charcoal; the first of these furnishing an immense equantity of dephlogisticated air, and the latter a considerable portion of inflammable air. The author calculates, that a cubic inch of gunpowder will yield above 569 cubic inches of permanent elaffic fluid: and as it appears from the experiments of Robins, that common air, exposed to the heat of red-hot iron, will be expanded to four times its former bulk, it follows that a cubic inch of folid gunpowder will, in the moment of the explosion, furnish above 2276 cubic inches of elastic air.

Article 28. Account of the Airs extracted from different Kinds of Waters; with Thoughts on the Salubrity of Air in different Places: In a Letter from the Abbé Fontana to Dr. Priettley.

The experiments related in this paper were made by the Author at Paris, in 1777 and 1778. By boiling the water of the Seine, as well as some other waters, the Author expelled from them air sensibly better than atmospheric air, after the fixed air, which was likewise expelled, had been separated from it by shaking it in water. From some of the Author's experiments, it appears, that water in general absorbs about twice as much

See M. R. Vol. LXI. September 1779, pag. 176. . . . . dephlo-

dephlogisticated as common air. He found that the Seine water, after it had been boiled a long time, absorbed, in forty days, about one fourteenth of its own bulk of dephlogisticated air; whereas, in the same length of time, it did not absorb more than one twenty-eighth of common air. This experiment, as the author observes, discovers a new characteristic, by which dephlogisticated air may be distinguished from common air; and shews that water absorbs a greater quantity of those kinds of air which contain a less quantity of phlogiston.

If water, after being deprived of its air, be exposed to common air contained in a receiver standing in quickfilver, the air which remains unabsorbed is so much more phlogisticated as a

less quantity of it remains in the receiver.

The Author mentions another, and hitherto unknown character, which distinguishes dephlogisticated from common air. The latter, he observes, shaken in water, instead of being diminished, is sensibly increased in its bulk. This increase begins to be sensible within a few seconds after the process commences; and has sometimes amounted to one twelsth of the bulk of the air, and even more. When it has attained its maximum, however, the bulk of the air begins to diminish; and in proportion to this diminution the air becomes gradually less good. On the other hand, dephlogisticated air begins to diminish from the commencement of the operation; and it continually loses more and more of its bulk, and, with its bulk, of its purity.

From these observations, the Abbé is inclined to infer, that dephlogisticated air ' is a fluid much different from common air; because it has peculiar properties by which it differs from common air, not from more to less only, but entirely; as is shewn by the property this sluid has of being absorbed by water; whereas common air receives an increase of bulk and elasticity by being shaken in water. —But is there not a seeming contradiction between this last observation and one of the above recited experiments, from which it appeared that water absorbed a twenty-eighth part of its bulk of common air? At least we cannot easily

reconcile the two observations.

The Author found no difference between the air of London and that of Islington, with respect to purity, as indicated by the nitrous test; nor between that at the iron gallery of St. Paul's cupola, and that of the stone gallery below it, or of the street adjoining.

PAPERS relating to ELECTRICITY and MAGNETISM.

Article 29. Account of some Experiments in Electricity: By Mr.

William Swift.

These experiments principally shew, that points draw off the electric matter, when excited, or prevent its accumulation. They They are illustrated with two plates; in the first of which the Author gives a sketch of his electrical apparatus, the whole of which is insulated. The machinery delineated in the second requires more explanation than the Author has given.

Article 39. Improvements in Electricity: By John Ingen-housz, F. R. S. &c.

From this Paper it appears, that the Author of it was the inventor of those electrical machines, in which a round plate or disk of glass is employed instead of a globe or cylinder. He afterwards conceived the idea of substituting, in the room of the glass plate, a disk of pasteboard, thoroughly imbibed with copal or amber varnish. He accordingly contrived a piece of machinery, in which three such disks, of four feet in diameter each. were whirled round, and rubbed with hares-skin. The electricity excited was so strong, that he took sparks between one and two feet long from the front surface of the first disk, by bringing his knuckle to it. On applying an insulated conductor to it, he procured sparks about four or five inches long; and which were so strong, that he did not chuse to receive many of them. It is to be observed, that the conductor was adapted only to receive the electricity furnished by the front disk. These plates were kept in good order in a heated room; but soon lost their power in a cold room, where they probably attracted moifture from the air.

Article 34. On some new Methods of suspending Magnetical Needles: By John Ingen-housz, F. R. S.

In this Article Dr. Ingen-house describes some very ingenious methods of suspending magnetical needles; particularly with a view of moderating the too great quivering or horizontal motion to which they are liable. The principal part of the contrivance confifts in placing the needle in water, oil, or fome other transparent fluid, and connecting with it cork, or other bodies of less specific gravity; so that it may nearly swim in the fluid.

MISCELLANEOUS ARTICLES.

Article 23. An Account of an Apparatus applied to the Equatorial Instrument, for correcting the Errors arising from the Refraction in Altitude: By Mr. Peter Dolland, Optician.

This ingenious method of correcting the refraction confilts in the applying two lenses, placed close to each other, before the object glass of the telescope; one of them convex, and the other concave; and both ground on spheres of the same radius: so that the refraction of the one will be exactly destroyed by that of the other; and when their centres and that of the object glass coincide with each other, the image of the object formed in the telescope will not suffer any change in its position. if one of them be made to flide over the other, in the direction οF

of a vertical arch, so as to separate its centre from that of the other lens; the image will change its altitude in the telescope. The quantity of refraction thus occasioned will be proportional to the space through which the lens has been made to move: so that the moveable lens may be so set, by means of a scale of equal parts, before any particular observation, as to occasion a refraction contrary and equal to that of the atmosphere, in any given altitude. Thus, the concave lens being moved downwards, its refraction will correct that of the atmosphere upwards; and the star will appear in the telescope, as if no refraction had taken place.

Article 27. The Description of two new Micrometers: By Mr. Ramsden, Optician.

These two instruments cannot be intelligibly explained without the assistance of the plates which accompany this article. It will be sufficient for us to observe, that the first is a catoptric micrometer; made by dividing the small speculum of a reflecting telescope, of Cassegrain's construction, into two equal parts, by a plane across its centre; so as to obtain two diffinct images, by separating the two halves of the mirror, and inclin-

ing them equally in contrary directions.

The other micrometer is founded on the principle of refraction. Here one of the eye glasses is divided into two equal parts, in the same manner as the small speculum above mentioned, which are likewise moved in contrary directions. A great advantage is derived from this micrometer's being placed in the conjugate socus of the first eye glass: for when a micrometer is applied at the object glass, or between that glass and its socus, the distinctness of the image must inevitably be impaired: the imperfections of the glass being magnified by the whole power of the telescope. In the present position, the image being considerably magnified before it arrives at the micrometer; any imperfection in its glass will be magnified only by the other eye glasses.

Article 25. On the Variation of the Temperature of boiling Water: By Sir George Shuckburgh, Baronet, F. R S. &c.

It was well known, even by Fahrenheit, that the heat of boiling water was increased in proportion to the increased weight or pressure of the atmosphere, and vice versa. He accordingly proposed to determine the weight of the atmosphere by means of a thermometer alone. Mr. De Luc's recent and accurate observations on this subject are likewise well known. The Author of this Article communicates a series of observations made by himself, with a thermometer excellently adapted to this inquiry, and so fitted up as to enable him to observe the height of the mercury to within one-fiftieth of a degree. From one of the tables given in the Article, we shall only select an example

ample of the lowest and of the greatest height that he obt

On the fummit of Snowdon in Carnarvonshire, when the barometer stood at Inch. 26,498, the boiling point was found by observation to be 207° 07. At the Adelphi Wharf, 3 1/2 seet above high water, on Dec. 26, 1778, the barometer standing at Inch. 30,957 (the height being reduced to the temperature

of 50°) the boiling point was observed to be 214° 96.

It may be proper to remark, that the last-mentioned barometrical observation is noticed by the Author, as indicating the greatest height of the barometer that he has ever known; and, as far as he has been able to collect, the highest point that it has ever been feen to fland at, in any country where observations have been made and recorded, fince the first invention of that curious and useful instrument.

The titles of the remaining Articles under this class are-Art. 30. Sitodium in Cisum et Macrocarpon, Ususque Fructuum qui exinde nascuntur, descripta a Carolo Petro Thunberg, M. D.-Art. 31. ## \* The Mathematical Articles in our next.

ART. XIV. Biographical Memoirs of Medicine in Great Britain, from the Revival of Literature to the Time of Harvey : By John Aikin, Surgeon. 8vo. 4s. fewed. Johnson. 1780.

Nour Review for March 1776, we gave a short account of Mr. Aikin's Address to the Public; containing a specimen of a work which he had projected, on the subject of Medical Biography; and requesting the affiltance of those who might be possessed of scarce and valuable materials, proper for an undertaking of that kind.

In the Preface to his prefent-work, he informs us, that the affistances which he had flattered himself with the hope of obtaining, have fallen very short of his expectations; that he soon perceived. perceived, that of all the materials for information, printed books were alone what he had any chance of procuring: a circumstance which reduced his plan to the compass of a comparatively modern period; —and further, that, after the most extensive enquiries, many of the publications he had lifts of were no where to be found; and a few, though known to exist, were locked up in libraries, the rules of which did not allow of their being lent for perusal, on any interest or security whatever.

The Author justly thought, however, that the materials which he had collected, after a diligent fearch continued for some years, were too valuable to be thrown away; and that his work was not likely to be improved by more delay of publication. He has therefore published the present volume; on a presumption, that a tolerable idea may be formed of the Mate of medicine and its practitioners, during a confiderable portion of time, from the Memoirs he has been enabled to

compile.

The work contains accounts of the lives and writings of fiftyfive persons; -- beginning with Richardus Anglicus, who flourished about the year 1230, and ending with Harvey and Glisson; the last of whom died in 1677.—A few specimens from the work cannot be unacceptable to our Readers in general. Those whose curiosity is more particularly directed towards the

subject, will not fail to consult the performance itself.

In the Memoirs relating to the life of Andrew Borde, or, as he styled himself in Latin, Andreas Perforatus, the Author obferves, that ' the reputation he acquired among his cotemporaries [he died in 1549] must be considered as a symptom of the remaining barbarism in the manners of the times. This physician to Henry VIII. in the first of his medical works, entitled the Breviarie of Health, commences his Prologue, addressed to his brother physicians, in this ridiculous style:—" Egregious Doctors and Masters of the eximious and arcane science of phyfic, of your urbanity exasperate not yourselves against me for making this little volume."—In this work the Author treats of the diseases of the mind as well as of the body. Mr. Aikin gives the following passages, as specimens of his manner:

46 The 174 Chapter doth shewe of an Infirmitie named Hereos. "HEREOS is the Greeke worde. In Latin it is named Amer. In English it is named Love-sicke, and women may have this Ackenes as well as the men. Young persons be much troubled with this impediment.

4 The Cause of this Infirmitie.

This infirmitie doth come of amours, which is a fervent love for to have carnal copulation with the party that is loved; & it cannot be obteyned, some be so soolish that they be ravished of their wittes.

" A Re-

## " A Remedy.

"First, I do advertise every person not to set to the hart that another doth set to the hele, let no man set his love so far, but that he may withdraw it betime, and muse not, but use mirth and merry company, and be wyse and not folish."

For the Satyriass, he recommends a more effectual remedy,

For the Satyriass, he recommends a more effectual remedy, which one cannot help wishing he had had influence enough over his royal patient to make him adopt it:—the leaping into a great vessel of cold water, and applying nettles to the offend-

ing part.

In another work, entitled "Compendyous Regimente, or Dictary of Health, made in Mount Pyller," he mentions most of the roots, herbs and fruits, in common use at this day; not-withstanding the prevailing notion of the low state of gardening among us at that period; and speaking of "wylde beastie's stelles," he most devoutly declares his high relish for venison.—"I have gone," says he, "rounde about Chrystendome, and over-thwarte Chrystendome, and a thousand or two and more myles oute of Chrystendome, yet there is not so muche pleasure for harte and hynde, bucke and doe, and for roobucke and doe, as is in Englande; and although the stelle be dispraysed in physicke, I praye God to sende me parte of the stelle to eat, physicke notwithstanding."

In the first mentioned work he professes much learning; giving the names of diseases in Arabic, Greek, and Latin. He derives the word gonorrhæa from Gomorrha:—but that we may not give the Reader an erroneous idea of the age in which he wrote, it may be proper just to observe, that he lived in the days

of a Linacre and a Caius.

The flate of furgery in the time of Henry VIII. and the deplorable condition of military practice, may be collected from the following relation, taken from a work of Thomas Gale, educated under Richard Ferris, afterwards Serjeant Sur-

geon to Queen Elizabeth.

"I remember," fays he, "when I was in the wars, at Muttrel, in the time of that most famous prince, King Henry VIII. there was a great rabblement there, that took upon them to be surgeons. Some were sow-gelders, and some horse-gelders, with tinkers and coblers. This noble seet did such great cures, that they got themselves a perpetual name; for like as Thessalus's seet were called Thessalions, so was this noble rabblement, for their notorious cures, called dog-leaches; for in two dressings they did commonly make their cures whole and sound for ever, so that they neither selt heat nor cold, nor no manner of pain after. But when the Duke of Norsolk, who was then General, understood how the people did die, and that of small wounds, he sent for me, and certain other surgeons, command-

ing us to make fearch how these men came to their death, whether it were by the grievousness of their wounds, or by the lack of knowledge of the furgeons; and we, according to our commandment, made fearch through all the camp, and found many of the same good fellows, which took upon them the names of furgeons, not only the names, but the wages also. We atking of them, whether they were furgeons or no; they faid they. were: we demanded with whom they were brought up; and. they, with shameless faces, would answer, either with one cunning man, or another, which was dead. Then we demanded of them what chirurgery fluff they had to cure men withell; and they would shew us a pot or a box, which they had in a budget, wherein was fuch trumpery as they did use to greafe horse's heels withall, and laid upon scabbed horses backs, with nerval and fuch like. And other, that were coblers and tinkers, they used shoemaker's wax, with the rust of old pans, and made therewithall a noble salve, as they did term it. But in the end, this worthy rabblement was committed to the Marshalfea, and threatened by the Duke's Grace to be hanged for their worthy deeds, except they would declare the truth what they were, and of what occupations; and in the end they did confess, as I have declared to you before."

Notwithstanding this representation, it appears that when he wrote this work (1566) the state of surgery was become still more deplorable.—" I have myself," says he afterwards, " inthe time of King Henry VIII. holpe to surnish out of London, in one year, which served by sea and land, threescore and twelve surgeons, which were good workmen, and well able to serve, and all Englishmen. At this present day there are not thirty-sour of all the whole company of Englishmen; and yet the most part of them be in noblemen's service; so that, if we should have need, I do not know where to find twelve sufficient men. What do I say? sufficient men; nay, I would there were ten amongst all the company worthy to be called surgeons."

The following quotation from a work of Dr. William Bulleyn, a cotemporary of the preceding writer, will probably amuse the reader. It exhibits a worshipful catalogue of knights and their dames, amateurs in surgery; and shews how they employed themselves, in their country mansions, in the days of Queen Elizabeth, when surgeons were every where scarce, and long before quackery had opened its numerous warehouses in the capital, and poured forth its nostrums for the benefit both of town and country.

"Many good men and women," fays Dr. Bulleyn, "withinthis realme, have divers and fundry medicines for the canker (probably cancer), and do help their neighbours that be in peril and danger, which be not only poore and needy, having nomoney

money to spend in chirurgerie, but some do dwell where no chirurgeans be neere at hand. In such cases, as I have sayd. many good gentlemen and ladyes have done no small pleasure to poore people: as that excellent knyght and worthy learned man. Syr Thomas Eliot, whose works be immortal; Syr Phillip Parris of Cambridgeshyre, whose cures deserve prayle; Syr Williams Gascoygne of Yorkshyre, that helped many sore eyen; and the Lady Taylor of Huntingdonshyre, and the Lady Darrel of Kent, had many precious medicines to comfort the fight, and to heale wounds withal, and were well seene in herbs. commonwealth had great want of them and their medicines a which if they had come into my hands, they should not have bin written on the backfide of my booke. Among all other there was a knyght, a man of great worship, a godly hurtlesse: gentleman, which is departed this lyfe; his name is Syr Anthony Heveningham (of Heningham, Suffolk). This gentleman learned a water to kill a canker of his own mother, &c.'

The good doctor, who so cordially believes in the cure of the conker, laments with equal simplicity and earnestness, that no efficacious remedy had yet been practised against witchcrast; which he affirms to be "more hurtful in this realm than either quartan, pox, or pestilence;" and expresses his forrow that damnable witches should be suffered to live unpunished, and so many blesses men burned."——It should be observed, that he was warmly attached to the principles of the Reformation.

The credulity and supersition of Sir Theodore Mayerne, physician to sour kings, is scarce less remarkable. He prescribes (says his present biographer) a powder for the gout, one of the ingredients of which is, raspings of a buman skull unburied; and again, speaking of the good effects of absorbents, he particularly recommends buman bones, of the same kind with the parts affected. He gives a recipe of an unguent for hypocondriacal persons, which he calls his balsam of bats. In its composition there enter, adders, bats, sucking-whelps, earth-worms, hog's grease, the marrow of a stag, and of the thigh-bone of an ox.— Ingredients, says the author, fitter for the witches cauldron in Macbeth, than for a learned physician's prescription.

In a posthamous work of the same physician, published by his godson, Sir Theodore de Vaux, consisting chiesly of pre-teriptions, vestiges of ancient medical superstition frequently appear.— The secundines of a woman at her first labour, who has been delivered of a male child, the bowels of a mole cut open alive, mummy made of the lungs of a man who has suffered a violent death, the liver of frogs, and the blood of wearsels, are articles of his materia medica. Amulets, too, are not forgotten.

Though ?

Though superstition is totally excluded from the modern practice of medicine, yet it must be owned, notwithstanding the reformation which has of late taken place in the art; custom, and the crast of physic, still support the credit, or at least the use, of many supposed remedies, which have as problematical a title to that appellation, as the balsam of bats, or the dried lungs of an executed convict.

In our account of this performance, we have given extracts rather unfavourable to the art and its professors: but the biographical memoirs of a Linacre, a Caius, or a Hervey, would have led us into too long details. With the last of these ornaments of the professor (or rather with Glisson), the Author concludes the present volume; for which we think him entitled to praise, for the industry he has shewn in collecting his materials, as well as for the manner in which he has employed them. We accordingly hope that he will meet with sufficient encouragement to induce him to prosecute his plan through succeeding periods; which, as he properly observes, will present objects still more interesting, and less liable to desiciency in the execution:—a design in which, he informs us, he has already made some progress.

# MONTHLY CATALOGUE.

For NOVEMBER, 1780.

## POLITICAL.

Art. 15. An Estay on the Population of England, from the Revolution to the present Time. With an Appendix, containing Remarks on the Account of the Population, Trade, and Resources of the Kingdom, in Mr. Eden's Letters to Lord Carlisle. By Richard Price, D. D. F. R. S. 8vo. 1s. 6 d. Cadell. 1780.

IN our Review for February, we mentioned the third edition of Mr. Eden's celebrated Four Letters to Lord Carlifle, accompanied by his additional observations, in a 5th Letter, on Dr. Price's notion of the decreasing population of this country. Mr. Eden holds the contrary opinion; and we remarked, that he maintained his more comfortable doctrine with ability as well as candour.

In the present tract, of which a second edition has been published, Dr. P. endeavours to resute Mr. E. and to support, on the most solid ground of fad, and the best authorities, his general position, that, while other countries are increasing, this country, in consequence of the causes of depopulation which have unhappily distinguished it, has for many years been decreasing. ——We shall be

<sup>•</sup> We should rather, perhaps, have said a third edition, because this Essay was originally printed at the end of Morgan's Dostrine of Annuities and Assurances on Lives and Survivorships; See Review for June 1780, p. 450.

had to see this doctrine refused by those who maintain, with Mr. B. that the ideas of our 'loss of trade, and diminished resources, as" well as a decrease of population,' are to be enumerated among 'the chimeras which baunt the joyless imaginations of some speculative men among us.

Att. 16. A Speech of Edmund Burke, Esq; at the Guildhall in Bristol, previous to the late Election in that City, upon certain Points relative to his Parliamentary Conduct. 8vo. 1 s. 6 d. Dodfley. 1780.

We have perused this excellent piece of oratory with admiration and delight.—Mr. Burke supposes his parliamentary conduct to have been arraigned, by some persons, particularly on the following points -On the first Irish trade-acts-On Lord Beauchamp's debtor's bill, -And on the late affairs of the Roman Catholics. On each of these heads he very copiously expatiates; and gives so clear, so manly, so convincing a detence of his principles and proceedings, as cannot, in our opinion, fail of extorting the warmelt applause from every generous, candid, liberal mind.—As for the inhabitants of Bristol, they are perhaps, rather to be pitied for the loss, than censured for their unfortunate rejection, of so able a representative.

Art. 17. A Letter to the new Parliament; with Hints of fome Regulations which the Nation hopes and expects from them. 8vo.

1s. Rivington. 1780.

The reigning evils of the times, religious, moral, and political, are here pointed out, with an earnest call upon the Lords and Gentlemen of Parliament, for the application of proper remedies. - In Yome of the Author's hints, and representations, we entirely agree with him; but with regard to his apprehensions of danger to the State, from the political tenets of some of our sectaries +, we are per-fuaded that he argues rather from misinformation, if not from pre-- judice, than from a certain knowledge of facts.

Political Mirror, in which is contained a Review of Art. 18. the Conduct of the Premier, chiefly from the Time of his famous Conciliatory Bill to America, &c. &c. By a Gentleman of the University of Oxford, 8vo. 1 s. Evans. 1780.

Although this 'gentleman of the University of Oxford' does not

write in a very gentlemanly ftyle, nor in a manner which will reflect great honour on that illustrious seminary, yet there are some remarks in his pamphlet which merit the public attention: particularly on the Subject of some lase new taxes, and on the importance of an independent Parkament.

Art. 19. Common-Place Arguments against Administration; with obvious Answers. Intended for the Use of the New Parliament.

8vo. 1s. 6d. Faulder. 1780.

Another Anticipation. - Why will this ingenious advocate for Administration thus continue to employ himself in hunting down a single and exhausted idea; --- be ! who can never be at a loss for fresh game.

<sup>+</sup> Not the Roman Cathelics, for of them the Writer appears to ensertain a favourable opinion. Government, he thinks, have most to fear from the Dissers-!!!

Art. 20. Nathan to Lord North. 8vo. 1 s. Wilkie. 1780. An ironical panegyric on the Premier, under the form of abuse and popular invective.

A MERICA.

Art. 21. A Plan of Articles of perpetual Union, Commerce, and Priendsbip, between Great Britain and her American Colonies; founded on the folid Basis of Justice, and proposed as a Medium between the Claims of total Independence on the one hand, and those of legal Subjection on the other. 8vo. 1 s. 6 d. Johnson, &c. 1780.

We really think this Author's professions are very honefily meant, when he offers this plan, as founded on the solid basis of justice, &c. And we also join with him in recommending it particularly 'to those who can divest themselves of passion and prejudice,—who, with liberal hearts, and unbiassed understandings, can judge with candor, and decide with justice, on the rights of mankind.'—We likewise cordially join with him, in his good prayer, at the close of his publication—'That the facred ties which reciprocally bind and connect the parts of society,—that our mutual sufferings, increased burthens, and growing evils,—may incline our hearts' [and the hearts of those with whom we are so unfortunately at variance] 'seriously to pursue the parts that lead to peace: peace upon a broad and liberal soundation—supported by justice and liberty, secured by interest, and cemented by mutual and solemn engagements!"

POETICAL.

Art. 22. Music in Mourning: or, Fiddlestick in the Suds. A Tragic comic, Poetical Burlesque, neither in Prose or Rhyme. 4to. 1 s. Faulder. 1780.

This Music, though often out of tone, has some lively notes, but not in the chromatic strain. The following passage contains some cretchets that sound strongly of the orchestra:

Let worthy N-Is-n with his martial Kets, Unscrew th' elastic heads, that nought but dub, Dire, doleful dub be heard; and S-rj-nt's trump, That filverly so sweet enchants our ears, Be hoarse and out of tune; the sprightly horns Be muff'd with dubbed fifts; the hautboys too, By &a-rp and Gr-y fo pleasingly attun'd, Shall croak a toad-like note with cotton stuff'd, And Ashl-y's bold bassoon, with shattered reed, Sound forth a growling, grumbling, grunting groan. Z-dl-r and Will-ms on their clear-ton'd viols, Which times and oft they touch with greatest skill, Shall screech-owl tones display, with drawling bowa And sliding fingers on the half press'd strings; While C-nd-l's tinkling harp forgets its fire, And, doubly buff'd, ftrums dismally the bass. The vocal choir of the theatric band Must all in gratitude attend, and join The tributary Song: hoarse let them be, For hoarse have they repeatedly been made, By channing forth his dull chromatic firains.

This

This fiddleslick in the suds seems to be the production of some augry child of rofin, who, from refentment at real or supposed oppressions, has almost fretted bis guts to fiddlestrings.

Art. 23. The Gray's Inn Applications of Pecious veil, When late, beneath Religion's specious veil, Bew. 1780.

Outrageous tumults turn'd each visage pale, The Constitution to the shock gave way, And savage rustians bore resistles sway: Then to preserve the Law and save the nation, In each part rose some bold Affociation.'

Some be-mused apprentice, we fear, has thus been misemploying his master's time, and tagging thymes, when, perchance, he should have been tagging laces. If, however, this be his first estay, we hope the young man will take warning from his misadventure.

"Grow timely wise, and quit this idle trade."

The State Mountebank, or Duke and no Duke.

Tale. 4to. 1 s. Fielding and Walker. 1780. This Tale, which is intended to fatirize Opposition, and to compliment Lord North, is an effort of such inoffensive abilities, that, we apprehend, it is as unlikely to gratify the one as to give pain to the other.

A Letter from a Burgess at Huntingdon to his Friend Art. 25.

in London. 4to. 1 s. Csowder, &c. 1780. Describes, with tolerable ease, and some degree of humour, in Anstey-werse (will our Readers allow this coinage?), the circumstances attending the late Election for Huntingdonshire.

A Storm: with a Description of a Water-spout, & Art. 26. Shoal of Dolphins; and other ominous Appearances. 4to. 6 d. Bury St. Edmunds printed, and fold by Crowder in London. 1780. The descriptions natural, the poetry moderate.

Art. 27. A new History of England in Verse; or the entertain-ing British Memorialist. Containing, the Annals of Great Britain, from the Roman Invasion to the present Time. Designed more particularly for the Use of Youth; but serving at the same Time to refresh the Memories of Persons in riper Years. With an Introduction concerning the Nature and Study of History. Charles Egerton, Esq. 12mo. 3 s. Cooke.

This work, we doubt not, might be defigned, as the title-page tells us, for the use of youth, it being well known to all who are versed in the craft of book-making, that school-books, where they succeed, are the most profitable articles of traffic. But to defign and to adapt are very different matters. It is a mistaken idea that some people have taken up without the trouble of examining, that to be intelligible is all that is required in books intended for the use of children. Every one knows the force of early impressions; how necessary is it, therefore, to put into the hands of youth the best and most excellent models in every species of composition, rather than run the risk of vitiating their tafte and misleading their judgment, by setting before them such Belman's rhymes as are put together by this Squire Egerton.

Now

388

A Now from his horse the King by chance is thrown, The fall quite dislocates his collar bone; Thus the great monarch, and the hero, dy'd, The higot's scourge, and true religion's pride. With him the glorious Revolution came, Preserve its spirit as your freedom's stame; The Bill of Rights we to this monarch owe, To guard our privileges from each see.

William was brown, and had a Roman nose, With piercing eyes, terrisic to his soes;

With piercing eyes, terrific to his foes;
A shortish stature, and his shoulders round,
A dauntless courage, and a judgment sound.

6 d. Lowndes. 1780.

The Bookfeller forgot to infert "New Edition" in the title-page.

Our Readers will find an account of the first edition of this InterJude in our Catalogue fer December, 1774. Art. 29.

Nove L.

Art. 29. The Count de Poland; by Mils M. Minifie, one of the Authors of Lady Frances and Lady Caroline S. 4 Vols. 12mo.

10 s. fewed. Dodsley, &c. 1780.

We have been so much amused by the perusal of this Novel, that we scruple not to recommend it as one of the most pleasing productions of this kind which has lately come under our notice. The incidents are well conceived, and the tale constructed in a manner properly adapted to interest the seclings of the Reader: there is an agreeable variety in the characters; the language is easy, and diversised; and for the moral, it is a very good one—as the Reader will find, if he will take the pains to search for it.

NATURAL PHILOSOPHY.

Art. 30. Microscopic Observations; or Dr. Hooke's wonderful Discoveries by the Microscope, illustrated by 33 Copper-plates, curiously engraved: whereby the most valuable Particulars in that celebrated Author's Micrographia are brought together in a marrow Compass, and intermixed, occasionally, with many entertaining and instructive Discoveries and Observations in Natural History. Folio. 12 s. Wilkinson, in Cornhill. 1782.

Dr. Hooke's Micrographia is a work fo well known in the learned and philosophical world, that any account, or commendation of it,

from us, would be altogether superfluous.

This celebrated production was first published about 80 years ago; and though two editions \* of it have fince appeared, the work is now extremely scarce, and fells at a great price.

Fortunately for the Public, all the places of this celebrated work, feven only excepted, were lately met with, well preferred, and almost

The last edition was given by the late ingenious Mr. Heary Baker.

in as good condition as when they first came from the hands of the engraver, no great number (it is supposed) having been taken from them. The little rust they had received was easily cleared away; and the seven plates that could not be found, were supplied by exact copies, 'little or nothing (says the Editor) inserior to the original.'

The engravings being thus discovered, repaired, and completed, the present republication was resolved on; not of the whole Micrographia, at large, but of the pianes, accompanied by such short and plain descriptions of the objects +, as might prove persectly to the satisfaction of the Reader, without satisfaction his attention by that werbose and dissused way of writing which was the mode in Dr. Hooke's time.

The Editor gives us another reason for abbreviating the letter-press part of Dr. Hooke's original publication. When this learned author wrote, the doctrine of Equivocal Generation 1, of a spontaneous production of many species of minute living animals, as well as vegetables, without any other parents than accident and putrefaction, almost universally prevailed; but every thing relative to this bypothesis has been judiciously omitted by the present Editor; whose object was clear description, rather than masters of opinion. On the whole, therefore, we recommend this publication as a valuable present to the lovers of microscopical researches,—the most delightful, perhaps, of all philosophical amusements.

MATHEMATICAL.

Art. 31. An Essay on the Resolution of plain Triangles, by common Arithmetic: with a new and concise Table, adapted to the Purpose. By Hugh Worthington, Junior. 8vo. rs. Bucklasdi 1780.

The writings of mathematicians who lived before the invention of logarithms, are full of complaints of the tediousness of the operations, and of withes that fome expeditions and exact method could be discovered for resolving the several cases of trigonometry. Ever fince the invention of such a method, and notwithstanding that tables of logarithms may be picked up on every stall; almost for the value of a pinch of south,—and, when purchased, scarcely take up more room in the pocket than the box out of which the pinch of south was taken, we have been continually inventing less exact, and exact aperate rules for the same purpose; and the reason alleged is, "That cases frequently occar in practice, wherein it is expedient to perform trigonometrical operations without the logarithmic canon." We are firmly persuaded that sew persons, now living, have had becasion to perform more, or a greater variety of trigonometrical operations.

Cc 1

<sup>†</sup> We must not omit to remark, that the Editor has likewise inferted many new observations, and discoveries made since Dr. Hooke's time, on the several subjects which the figures represent: so that, on the whole, a great variety of natural history is conveyed to the Reader's hands, in a moderate compass, and at a small expense.

the Reader's hands, in a moderate compais, and at a small expence.

† Those who would see the doctrine of Equivotal Generation refuted, in a masterly manner, are referred to a Letter to Sir Robert Southwell, printed at the end of Whitlocka Bulftrode's Estays.

rations than we have; or in more uncouth and distant places; and no such cases ever occurred to us; nor, we believe, to any one else who did not, either through negligence or choice, invite them. We cannot therefore say much of the usefulness of this performance.

But if we are to confider it as an essay in speculative mathematics, to exercise the genius and shew the ingenuity of its Author, as most mathematical publications are, we are ready to allow it considerable merit. The method here given is new, shorter, and more exact than any we have seen before, of the like kind; and there is great ingenuity in the thought which suggested the table of radii.

Art. 32. An Essay on Sir Isaac Newton's Second Law of Motion.

By the Reverend Mr. Ludlam. 8vo. 1 s. Cadell. 1780. It appears, from a short Advertisement presided to this Essay, that it was presented to the Royal Society, but not printed in their Trans-

actions: why it was not printed does not appear.

Sir Isaac Newton, in his eighth definition, saye, that "the quantity of a force is its measure, proportional to the motion it generates." In his second Law of Motion he afferts, that "the change of motion is proportional to the moving force impressed." This, Mr. Ludlam says, contains an identical proposition. Our respect for Mr. Ludlam's abilities, both as a philosopher and a mathematician, is so great, that we are almost inclined to suspect our own judgment when it classes, as it does in this case, directly with his opinion. If the truth of Sir Isaac's second law of motion had depended on the definition, Mr. Ludlam would, undoubtedly, have been right; but it does not appear to us, that there is the least relation between them. However, admitting that there were, it is not a matter for philosophers and mathematicians to dispute about, as no part of his suture reasoning is influenced by it, any more than Euclid's would be if he had inserted amongst his definitions this which follows:—

46 Magnitudes are equal when each of them is known to be equal

to a third of the same kind."

And for this reason, Euclid's first axiom, and Sir Isaac Newton's second law of motion, have their foundations in reason and observation; and therefore are independent of any principles whatsoever which are subsequent to those.

MILITARY.

Art. 33. Elements of Fortification. By Lewis Lochée, Master of the Military Academy at Little Chelsea. 8vo. 6s. Boards, Cadell. 1780.

- This country has, for a confiderable number of years, been in posfession of two valuable treatises on fortification, written by Mr. Muller: for our Account of which, see Review, Vol. XII. p. 121.

Mr. Lochée hath, as might be expected (for have we not a right to profit by the labours of our predeceffors?), not a little availed himself of sormer publications on the subject; but we do not perceive that he hath greatly improved on what Muller had done before him. Most of the subjects treated in this volume, are discussed by both writers, with remarkable agreement and conformity of opinion and doctrine.—We have not observed, in the present publication, much new matter, except the Author's instructions with respect to the colours used in drawing plans and profiles; and his account of the

most remarkable systems' which have been proposed by different engineers.

Art. 34. A Letter to John Dunning, Esq; Barrister at Law. on the Trial of the Rev. Henry Bate, Clerk, upon the Information of his Grace the Duke of Richmond, for a Libel, &c. By a Student of the Middle Temple, 8vo. 18. 6d. 1780.

· Pights the battle over again, calls many a pointed dart at the Duke of Richmond, and the great lawyer above mentioned; routs the whole profecution army, and afferts, that General Bate, who had been

worsted in the action alluded to, ought to have another trial.

#### MEDICAL.

Art. 35. The Anatomy of the Human Body: By Samuel Foart Simmons, M.D. F. R. S. Member of the College of Physicians, London, and of the Royal Medical Society, Paris. Vol. 1. 8vo.

6 s. Boards. Murray. 1780.

This work has been drawn up by the Author principal'y for the use of students; and appears to be executed with accuracy present volume he treats only of the ofteology and myology; reserving, we apprehend, what relates to the nerves, vessels, vessels, vessels, vessels, and the common integuments, with their appendages, for some future publication. He generally confines himself to a concise description of the parts, and their uses, without entering into physiological discussions, which would have been inconsistent with his plan, as such enquiries would have rendered his work too voluminous,

In treating of the teeth, the Author differs from Mr. Hunter, in believing that the bony part of a tooth has a circulation through its Aubitance, and even lymphatics, though we are not able to demonfittate its vessels. He founds this opinion on the following considerations:—1. On the transplantation of a tooth recently drawn, which will, after a certain time, become fixed, and will preferve its colour; -circumstances that indicate a real union of vessels; and which do not take place with respect to a tooth that has been long drawn, and which never becomes fixed. Mr. Hunter's principle of life, the Author thinks, may be applicable to scoopbites, but not to man, and the more perfect animals.

2. The fangs of a tooth are liable to morbid swellings, which are analogous to the swellings of other bones, and indicate a fimilarity of structure, especially as they are found to be invested with a periosteum.

3. It is a curious fact, the Author adds, though not generally known, that, in cases of the phibifis pulmonalis, the teeth become of a milky whiteness, and in some degree transparent. This gircumstance,

he thinks, sufficiently proves them to have absorbents.

In the Vyology, the Author follows Albinus, with respect to the arrangement, by describing the muscles according to the order in which they are situated; beginning with the more external, and proceeding to the muscles that are more deeply situated. He generally sdopts the nomenclature of Douglas; sometimes, however, following that of Albinus, or using the synonyma of Winslow, Cowper, and other writers. - On the whole, this appears to be a judicious and use-Cc 4

ful compilation: as a work of this kind, comprehending the moderatim provements in anatomy, has been long wanted in our language. B., Art. 36. A Description of the Apparatus of arbitrarily heated and medicated Water-baths, partial Pumps, vapourous and dry Baths, internal and external, moist and dry Fumigations, oleous, sapons-

nternal and external, moilt and dry Fumigations, oleous, iaponaceous, spirituous and dry Frictions, &c. &c. With Cases of Cures, &c. &c. By R. Dominiceti, M.D. 8vo. 1s. Nicol. 1779.

No doubt, we imagine, can be entertained of the efficacy of Dr. Dominiceti's improved baths, in many diseases to which such remedies are adapted: we are therefore concerned to see them offered to the public in 'such a questionable shape.' Quackery, under its va-

Dominicati's improved baths, in many diseases to which such remedies are adapted: we are therefore concerned to see them offered to the public in 'such a questionable shape.' Quackery, under its various forms, comes so frequently before us, that it is impossible for us not to imbibe the utmost aversion to it; and where it appears, we are apt to conclude that there is an effential want of merit to support interested pretensions. It is certain that the publication before us has all the air of a Charlatan's puff; nor can the right worshipful name, of Sir John Fielding (oddly enough used on this occasion) skreen it from critical contempt. And yet, after all, the baths may be serviceable to those who use them under proper adaptes.

Art. 37. Medical Commentaries, exhibiting a concile View of the latest and most important Discoveries in Medicine and Medical Philosophy. Collected and published by Andrew Duncan, M. D. &c. &c. Part I. for the Year 1780. 8vo. 18.6 d. Dilly.

Dr. Duncan has long been known as the principal conductor of the Medical Commentaries; but he now first appears as the fole compiler of it. The work is, however, still continued on the same plan; and from the general opinion of Dr. Duncan's industry and judgment, we doubt not that it will still be countenanced by the friends of medical improvement.

MISCELLANEOUS.

Art. 38. An Essay shewing the extreme Ignorance, or Malice prepense, of the late Rioters, &c. 4to. 6 d. Kearsly.

It is somewhat extraordinary, that any one would seriously set himfelf to demonstrate what no man in his senses could question,—the extreme ignorance or malice of the late rioters.

Art. 39. En Dansk og Engelsk Ord-Bog. Sammenskrævet of Ennst Wolf. 410. 12 s. 6d. sewed. White. 1779.

This Danish and English Dictionary is esteemed, by those who are skilled in the first-mentioned language, to be a valuable publication. The Author is a merchant in London, and is sufficiently master of the English for a work of this kind.

Art. 40. The Abbey of Kilkbampton; or, Monumental Records for the Year 1980: Faithfully transcribed from the original Inscriptions, which are still perfect, and appear to be drawn up in a Style devoid of fulsome Panegyric, or unmerited Detraction; and compiled with a View to ascertain, with Precision, the MANNERS which prevailed in Great Britain during the last fifty Years of the eighteenth Century. 4to. 3s. Kearsly. 1780.

eighteenth Century. 4to. 3 s. Kearfly. 1780. In this new species of satire, or mode of satire, &c. the characters of our great people, male and semale, are drawn in the sorm of monumental inscriptions, conceived, chiefly, in the spirit and style of the celebrated epitaph on Colonel Chartres.—Some of the likenesses

a church on Cotonet Chartres.—30me of the likenen

in this motiey picture are pretty well bit off; many are caricatures; and a few are exhibited in a favourable light,

Art. 41. Choix de Livres François, à l'Usage de la Jeune Noblesse, où les Jeunes Gens de Qualité, de l'un et l'antre Sere, pourront apprendre, à connoître d'eux-memes, et sans Maitres, les meisseurs Livres concernant les trois Genres les plus amusans de la Litérature Françoise, savoir, les Romans, l'Histoire, et la Poesse. Par Mr. Le Jeune, Maitre des Arts dans l'Université de Paris. 8vo. 6 s. bound. Elmsley. 1780.

The intention of the writer of this work is to coumerate the most sminent French writers of romance, history, and poetry, and to sketch

an outline of the character of each.

These sketches are drawn with more vivacity than judgment. In proof of this, we need only instance in the author's idea of Hume, and of the Abbé Raynal; the former of whom, he asserts, is always imparsial, and the latter he speaks of as a puerite and offensive declaimes against religion, government, and good morals. The book, however, may be of some use, as a catalogue of the principal French writers on the branches of polite literature anumerated in the title. Fart. 42. An Heroic Address in Prose, to the Rev. Richard Watson, D. D. F. R. S. Regius Protessor of Divinity in the University of Cambridge, and Archdeacon of Ely, on his late Discourse delivered to the Clergy of the Archdeaconry of Ely, on May 9th and 10th, 1780. Adorned with Notes entertaining and instructive. By the Author of the Heroic Episse to the same Reverand Person.

age, 4to. 2 s. 6 d. Becket.

Dr. Watson, in his late Discourse to the elergy of the archdesconry of Ely, has sketched out a scheme for 'an institution to be established at Cambridge, for the express purpose of translating and publishing Oriental manuscripts. It is this scheme, or part of it at least, which has drawn upon the ingenious and worthy Prosessor the raillery of this Heroic Address. Though we do not estimate the talents of this self-complacent Writer so highly as either he, or the Cambridge undergraduates may, to whom, no doubt, a baited prosessor must be excellent fun; nevertheless we are very ready to own, that he has struck out some ideas that are laughable and humorous; and his quotations, though frequently brought forward with an oscentation that is disgusting, are sometimes not ill-applied. With respect, however, to the general merit of the piece, we think it contains nearly as much misse-presentation as argument, and full as much pertuess as wit.

Art. 43. A Charge to the Grand Jury of the County of Middler fex. delivered at the General Sesson of the Peace, holden at Hicks's Hall, in the said County, Sept. 11th, 1780. By Sir John Hawkins, Knight, Chairman of the Quarter Sessions, &c. 8vo. 6 d. Brooke.

A judicious and well adapted exposition of the nature, design, utility, and obligations of Grand Juries.

RELIGIOUS, &c.

Art. 44. Methodism and Popery dissected and compared; and the Doctrines of both proved to be derived from a Pagan Origin. Including an impartial and caudid Inquiry into the Writings of St.

<sup>\*</sup> Vid. Art. XII. of this Month's Review.

Paul, with Remarks on the Nature and Affinity between Enthuliasm and Superstition. 8vo. 1s 6 d. Fielding and Walker. 17-9. There is some wit and some good language in this personance; but its prosances and impudence are much more abundant than either. The Author is one of those teaxing slies that (as Dr. Warburton observes, in his blunt way) are eternally pesseng joine fore place. We would add, that these impertinent and spiceful animals generally make the place fore, and then aggravate the mischief their own venom hath occasioned.

This Writer hath the effrontery, or folly (we know not which to call it—" for it seems either"), to dedicate this piece of hacknied infidelity to Dr. Hinchciisse, the bishop of seterborough, and to implore his patronage, because 'no man on earth (says he) is a better judge than your Lordship, whether my position—" That the samous apostle's writings were the cause of the differences which have happened among Christians," be founded in fact or not."—" My position!"—And what if it be proved?—We have lately told a doughty Deist, who 'studies scripture at the inns of court,' that we ought not, in reason or gratitude, to quarrel with the Sun, because (as Hamlet says, he 'breeds maggots in a dead dog.' If the unlearned and the unstable weest the writings of St. Paul, as they do all the wher striptures, to their own destruction, must those who are disposed to make a surer and better use of them be deprived of their benefit?—But to argue with a wordy declaimer, would be offering an insult to the dignity of reason.

This writer's flory of De Whim (or 'mad Jack Calvin,' as he elfewhere calls him) is a poor, withered slip of wit, grafted on Dean

Swift's original stock.

His observations on the pagan origin of methodism and popery, are trite and superficial. They have indeed some appearance of smartness and vivacity; but they discover little judgment, and less

learning.

The Writer hath attempted (and not very unsuccessfully) to delineate the characters of Whitesield and Wesley; but he makes an egregious mistake, where he supposes that the former, and not the latter, was the falber of methodism. John Wesley had this bonour (if honour it might be called), and having been joined by his brother Charles, the late Mr. James Hervey, a Mr. Clayton, and a Mr. Ingham, he instituted a kind of religious society at Oxford, on the most higid plan of devotion. The members of this society were denominated Methodists, from the regularity they observed in conforming to the orders of the church, and the discipline of their own institution: and it was in consequence of the character they maintained for strictaess and sanctity of behaviour, that Mr. Whitefield, who laboured under a religious melancholy, conceived a strong desire to become one of their number. He communicated his inclination to Mr. John Wessley, and was admitted a member.

This Author might have diverted himself as much as he pleased with De Whom, and all the children of De Whom's family; but in making merry with St. Paul, he shewed but his impotence and his malice. To such writers we will only say — Go—go along, poor deviis! the world is wide enough: —don't taint the sacrifices of the

B...k.

Ast. 45. A short View of the Tenets of Tritheists, Sabellians, Trinitarians, Arians, and Socinians; intended to affitt plain Christians in forming a general idea of the principal Opinions held on the Trinity, and of the Difficulties attending them, and to promote Candour and Charity among those who differ in their Apprehenflons on that Subject. The Second Edition, with Improvements, and an Appendin on the Worship of Jesus Christ. 8vo. 1 s. 6 d.

1780.

We have little to add to the account already given of this pamphlet, which our Readers will find in the Review for October, 1778, p. 318. Thoughtful men cannot but observe, with assonishment, the heats and hatred which have been occasioned by the subject of this treatife, especially when they consider, that even those Trinitarians who may be accounted the most orthodox, and are termed Realists, are obliged to allow some kind of subordination, while they acknowledge the Father to be the root and the fountain of deity. The reason there is for being modest, humble, and candid in our inquiries and our determinations on the topic, are clearly and sufficiently evinced in this valuable performance, which is now republished with very considerable additions, particularly the Appendix, on the worthip of Jesus Christ, the scripture doctrine of which our Author appears to have studied with great attention.

Art. 46. The Scotch Preacher: or, 2 Collection of Sermons. By some of the most eminent Clergymen of the Church of Sco. land.

12mo. 35. Cadell.

The subjects of the Sermons contained in this volume are these sollowing:- ramily-worthip; by Dr. Hunter of Dumfries .- The Reasonableness and Necessity of Public Worship; by Robert Petrie. V.D. M. of Cansbie .- The Death of Christ; by Mr. Somerville, of Jedburgh,-Kind Affections; by Dr. Macfarlane, of Canongate,-Our Saviour's Prayer for the Union of his Followers; by William Macgill, V. D. M. of Ayr .- The Success of the first Publishers of the Gospel a Proof of its Truth; by Dr. Campbell, Principal of Marischal college, Aberdeen.-The Sufferings of Christ compared with those which fall out in Life to other Men; by Dr. Ugilvie, of Midmar .- The Cause, Symptoms, and Cure of Indifference to Religion; by Dr. Gray, of Abernethy.—The Peace of the Grave; by John Mackenzie, V. D M of Portpatrick.—The Excellency of the Spiric of Christianity; by Dr. Leechman, Principal of the University of Glasgow. - Though these Sermons are not of equal excellence, yet there is not one of them which has not a considerable degree of merit, fully sufficient, indeed, to recommend it to those who are fond of such compositions, and friends to rational religion.

\* For the former volumes of this collection, See Review, vol. LVII. p. 332.

Popish Controversy.

Art. 47. Free Thoughts on the Toleration of Popery; deduced from a Review of its Principles and Hillory, with respect to Liberty, and the Interests of Princes and Nations; wherein the Question concerning the Repeal of the penal Statutes is examined, and some late Acts of the British Legislature are considered, &c. &c. By Calvinus

5

Calvinus Minor, Scoto Britannicus. 8vo. 4s. fewed. Edinburgh printed, and fold by Cadell, &c. in London. 1780.

The appellation assumed by the Author sufficiently expressed his principles. Calvin the Younger possessed the shrewdness, spirit, and severity of the father of the samily: nor would old Jack of the North have discounted him as very near of kin to his own soul, or refused to have invested him with the honours of the house of Geneva.

One quotation we judge to be a fufficient specimen of the Author's design in writing this book, and of the style and manner in which he

hath conducted it :

Who can refrain from wondering that the old "mother of harlots and abominations of the earth," should again lift up her head in this land; and that she should at this time of day meet with such kindly reception and entertainment among us!-That ever Rome should have acquired fuch an ascendant over the nations, and enjoyed for fo long a time universal influence and unrivalled dominion; making all forts of people, without exception, to swallow, blindfold, ber monstrous absurdities, and tamely bear her despotic pride and whimfical caprices, is one of the things in the history of mankind that astonishes. When the apocalyptic divine saw her in the height of her power, and decked in all her splendor, he "wondered with great admiration." But that this enchantress should, in the bloom of her meretricious beauty, dazzle and bewitch the nations, and " make them drunk with the wine of her fornications," is not quite fo marvellous, as to behold her retaining the same power, and practiting still the same arts, not altogether without success, even now in her extremest old age, when she stands tottering on the brink of her That she should, in her present haggard worn-out burning grave. form, pretend to new conquests, and that in places where her cheats had been discovered, and her magic circle broken, she should again attract the kind looks of kings and courtiers towards her, and decoy and infatuate kingdoms, equals the most romantic tale which her lying legends have to tell. To see them admiring her wrinkled face, courting her blafted favours, and returning to her stale and unwhole-Some embraces, is an event so odd and unaccountable, that it may well pass for a miracle, and is a demonstrative proof, that these her lovers are fallen into a state of greater dotage than herself.

How much must the old lady be pleased with this after-growth of affection, and this late and unexpected return of courtly savour! The harsh and rough treatment which she hath met with in times of less politeness and gallantry, will now be forgot, and fully compensated by these new blandishments and caresses, which must prove the more stattering and soothing, that they succeed such a violent and fatal breach, and follow after a long suspension of kindly intercourse!

Thus Nison captivated, like this old subers of Babylon, when tottering on her grave!—and thus the veteran duchess of M—h, with a kind of mutual sympathy for the wants of a fifter \*\*\*\*—But we cannot expaniate like our author;—we can only say, that he supposed, with him, that old age would be doubly stattered and soothed by blandishments and caresses after a long suspension of sindly

7.

intercourse.'--- "Twill do her old heart good."-said her antiquated Grace.

Art. 48. The Protestant Alarm; or, Popish Cruelty fully dis-played. Containing an impartial Enquiry into, and a fair Investigation of the Propagation, Rife, Doctrines, Discipline, horrid Practices, idolatrous Ceremonies. Supersitions, Tyrannies, Persecutions, Tortures, Massacres, &c. of the Romish Church: Calculatest
to detect the dangerous Tenets of Popery, to counteract the possesses of the Romish Church and Times ous Effects which its Principles may promote. - Soited to all Times, but more particularly to the present important Crisis.—The whole comprized in a Series of Dialogues between Father and Son. Inscribed to the Protestant Association. By John Fellows, Author of the History of the Bible in Verse, and of Grace Triumphant, a

1 2mo. 3 s. Hogg. 1780.

As the principles of humanicy and of Christianity unite to render us firm friends to religious soleration and liberty of conscience, we cannot but wish that Roman Catholics, as well as others, might share the benefit. At the same time it may be asked, whether the history of our own and other countries, together with the certain tenets of Popery, do not prove that concessions ought to be made in a very cautious and guarded manner? May it not be wished that some of those gentle-. men, especially of the clergy, who have manifested a becoming spirit of moderation and candour in favour of a late bill, had at the same . time exerted themselves to instruct the people in true Protestant principles, and fortify them against the infinuations and allurements of Popery i In this view we must, on the whole, approve the publication now before us, in which the errors, absurdities, and intolerant spirit of Popery, are fairly exhibited, and justly exploded. It is to be wished that books of this kind might be put into the hands of every Protestant; for though this is termed an enlightened age, a most deplorable ignorance on religious subjects prevails among the body of the people.

Art. 49. The Spirit of Popery displayed; or the Doctrine and Discipline of the Papal Church on the following several Heads,-Unity of Doctrine, Blasphemy, Perjury, False-witnessing, Equivo-cation, and mental Reservation, Idolatry and Irreligion, Robbery, Steafing, Murder, Parricide, Treason and Regicide, Uncleanness, &c. laid open and explained, in the very Words of their most celebrated Doctors and Cafuists. With a Preface on the Question, Is Faith to be kept with Hereticks? Inscribed to the respectable Asfociation in Britain, now united for the Support of the Protestant Religion, by their affectionate Brother, the Editor. 8vo. 2 s. Macgowan, 1780.

Macgowan.

This work is a professed translation of authentic extracts from writers of the order of Jesuite; a large volume of which was exhibited to the parliament of Paris, and procured the sentence that expelled the whole forety from France in 1762. The Translator does not avow his labours, or authenticate his quotations from these reverend fathers with his own name, which was certainly to be expected; and it may be truly added, that however faithfully the talk may be executed, it might have fallen into more able hands than those of 2 this nameless affectionate brother of the Protestant Association.

Did

Did we entertain any doubts of the veracity of these specimens, they would rest on the gross immorality and childishness of the restoning cited from the grave theologians and professors of morality, whose names are prefixed to them. That the church of Rome is a very convenient establishment to shelter and console the frailty of mortals, who have money ready to intitle themselves to her favours; and that she is not disposed to be unreasonably severe with those who apply properly for induspence, are circumstances which have long been sufficiently known. But surely the boasted sons of St. Ignatius must have gained their reputation otherwise than from such weak and wicked doctrines as are here quoted from their works!

#### SERMONS.

I. Preached at the Anniversary Meeting of the Sons of the Clergy, at St. Paul's, May 6, 1779. By Robert Richardson, D. D. F. R. S. and S. A. Prebendary of Lincoln, and Rector of St. Ann's, Well-minster. 4to. 1s. Bathurst.

Dr. Richardson pleads in a rational, sensible, and persuasive menmer, in behalf of the charity. We unite heartily in the prayer with which he concludes, 'That the ministers of God's word may neither fail of support from the people, in their distress, nor ever cease to deferve it.' To the sermon is added a list of stewards and preachers, together with the sums collected since the year 1721.

II. The good Christian happy in Death. Preached at Newbury, May 28, 1780. Occasioned by the Death of Dr. John Collet, late Physician of that Place. By David James. Published by Desire. 8vo.

6 d. Johnson, &c.

To improve the inflances of our common mortality by an address to those who yet survive, is highly pertinent and seasonable; but suneral discourses have so often degenerated into panegyric and flattery, that they are at present, perhaps, too generally omitted. It is not always necessary, on such occasions, to take notice of the character of the deceased. In some sew instances this may be proper, as, we apprehend, it was in the case before us. The Sermon is sensible, pious, and practical: a just tribute to real worth; an affectionate, useful, consolatory address to the living. Dr. Coller's character is high, much above the common level; but Mr. James says, 'I dare appeal to all who truly knew him, whether this essay doth not come greatly short of the amiableness of the original. What would be deemed distinguished praise to others, is to him but simple justice.'

111. On religious Zeal. Preached in Greenwich Church, Jane 11.

1780, and addressed to every Protestant Subject in the Realm. By Andrew Burnaby, D. D. Vicar of Greenwich. 8vo. 6d.

Payne.

In this spirited discourse, Dr. Burnaby expresses very strongly his amazement and displeasure at the late atrocious riots in our metropolis. We must concur with him, that our resentment of such outrages and disorders can hardly be too warm.—He hesitates not in charging it all to the Protestant Association. On this part of the subject, we have not much to offer; but we think it is not impossible that time may convince the Doctor, that the horrid preceedings which

÷

he so justly execrates, had some other origin.—We only add, that the observations on religious zeal in this sermon are pertinent and judicious; that the recommendations of peace and love are warm and animated; and that the preacher's declarations against the principles of Popery, and in favour of religious liberty, are worthy of a Christian Protestant minister.

N. B. We have seen a penny edition of this Sermon, adapted for general circulation, and particularly for the benefit of the common people; a defign to which we cannot but wish success.

IV. National Unanimity recommended, and enforced, June 22, 1780, at St. Dionys Back Church, before the Company of Armourers; by Thoms Weales, D. D. Vicar of St. Sepulchre's. 4to. 15. Cadell.

Dr. Weales, in a sensible and pleasing manner, recommends mutual love and considence among men and Christians, from that well-known exhortation which Joseph, on an affecting occasion, addressed to his brethren, See that ye fall not out by the way. He takes a short notice of the late riots; and in the close of his Sermon briefly speaks of general unanimity, as particularly desirable in the present critical state of the public.—This is a common topic, and often declaimed on without sufficient discrimination. Unanimity in a good cause is always to be wished for; but a general concurrence in evil measures is, surely, the high road to destruction. We mean this as a general remark only, and not in particular reference to Dr. Weales's Discourse.

V. Difference of Sentiment no Objection to the Exercise of mutual Love.

At the annual Meeting of Ministers in Dudley, May 10, 1780.

With additional Notes. By Benjamin Carpenter. 8vo. 6 d. Buck-land.

This Preacher is no advocate for lukewarmness and indifference in religion, though he strenuously pleads for mutual love. The character of the bigot, when free from malignant passions [if bigots are ever free from them, which we doubt], he regards as more deserving of esteem, than that of the man who is indifferent to all religion, and yet boats of his candour. The great aim of his Discourse is to shew, That diversity of sentiment ought not to prevent the exercise of that love which our Saviour enforces; and farther, That the diversity of sentiment among Christians is not so great as is commonly imagined. These propositions he illustrates and supports by many judicious and useful reslections. In the Notes several remarks are added, which could not be admitted into the Sermon at the time of its delivery. The publication of this Discourse is owing, as we have been informed, to the misrepresentations of some bigots who heard it: so that the Preacher was obliged to print in his own desence. But this we only say from report.

VI. At South-Audley Chapel, April 16, and at Brentford, May 21, 1780. For the Benefit of the Humane Society. By H. C. C. Newman, A. B. of Trin. Col. Cambridge. 8vo. 1s. Rivington. A fensible and spirited recommendation of the truly charitable institution for the recovery of persons apparently drowned. A poetical, and well executed Paraphrase on the 13th Chap. of 5t. Paul's Epistle

Epifile to the Corinthians, is prefixed; and to the Discourse added, an Account of the Society, which was established in 1774.

The fuccess has been very great indeed!

## CORRESPONDENCE.

We have received a modest and candid remoustrance from the Author of ' Alwyn, or the Gentleman Comedian;" who thinks we have been rather harsh in the judgment we have passed on that performtance. We are forry that we cannot infert his paper at length. We find, from disagreeable experience, that by giving way, as we have soe often done, to appeals of this kind, we have involved ourselves in a difficulty which we must not suffer to increase upon us. Letters from authors who wish to be ' heard in their own desence,' have lately been showered upon as in such plenty, that were we to pay all the attention to them which their respective writers seem to expect, there would remain little room for any thing elfe in our Journal.-The Good Manners, however, and the Good Sense, which diffinguish the present epistle, justly entitle the writer to some acknow-bedgment; and we scruple not to declare, that by the handsome apelogy which he has made, both for bis Work and for its Reviewer, he has at once raised our opinion of his abilities, and given the fairest -testimony of an amiable disposition. -- On these accounts, we cannot help forming expectations of confiderable improvement in this gentless. man's future productions, should he incline to try his fortune again, in the hazardous lottery of literary publication, in which the blanks. - are so much more numerous than the prizes.

\*A letter figned John Kay, and dated at Bury, Oct. 26, information, that Mr. Brindley was not the inventor of the plan for cleaning the docks at Liverpool—See Review for Aug. p. 94. That the letter-writer's father invented that method; and that he (our Correlipondent) gave the hint of it to Mr. Brindley.

Mr. K. allows Mr. B's great and unquestionable merit in mechanics; and justly thinks it will be no injury to his fame, to plack

from his plumage 'a feather which belongs to another.'

We are forry to learn from this Correspondent, that so good a mechanic is his father has been lost to this country by the want of pamonage, and forced to spend the remainder of his days 'in the South' of France, on a small pension from the French government.'

You W. N. complains of an inconvenience, which, he way be affored, is purely accidental, and perhaps, like other accidents, abformately unavoidable. He means, the continuing in one volume of the Review, articles which were begun in the preceding volume.—As there is no fecurity from interruptions of either the health or the leifure of the gentlemen who write in our Journal, nor a possibility of guarding against incidental disappointments, the course of befiness—and be left, as usual, to take its own direction.

### THE

# MONTHLY REVIEW,

For D E C E M B E R, 1780.

## 

ART. I. A Series of Adventures in the Course of a Voyage up the Red Sea, on the Coasts of Arabia and Egypt; and of a Rouse through the Defarts of Thibais, hitherto unknown to the European Travellar, in the Year 1777. In Letters to a Lady. By Eyles Irwin, Esq; in the Service of the Honourable the East India Company. Illustrated with Maps and Cuts. 410. 15 s. Boards. Dodsley, 1780.

R. Irwin, in company with three other gentlemen, departed from Madras about the beginning of the year 1777, with dispatches from the President, Lord Pigot, to the Directors of the India Company. He croffed the Indian Ocean in 42, days,, and in April arrived at Mocha, the ancient capital of Arabia Felix. At this city the English nation byly hath established a Resident. This is a late regulation; but the policy and advantage of it is obvious to every one; for now the coffee is transported in country bottoms to Bombay, from whence our Indiamen convey it to Europe. By this plan the Company are eased of a considerable expence, as the appoint-. ment of supercargoes to this station, and the heavy duties of this port, must have lessened the advantages which resulted from this trade when it was carried on by the Company's own ships. Mr. Irwin pays a very handsome compliment to ' the mild demeanor' and 'acknowledged abilities' of Mr. Horseley, the prefent Resident at Mocha. Reslecting on the polite attention of this gentleman to our travellers, Mr. Irwin expresses himself in a manner that does honour to his own feelings: 6 Hospitality and politeness are acceptable in all places, but doubly so to the way-worn traveller who the leasts expects to meet with them in a remote and uncivilifed region.' Vol. LXIII. After Dd

After some account of the city and its environs (illustrated with a plate, containing also a view of the Straits of Babelmandel), our Author acknowledges his obligations to Mr. Horseley for an ingenious conjecture relative to the barren coasts of Arabia Felix. ' For the space of 15 or 16 miles (says he) from the beach, the land rifes in a gradual afcent towards the foot of the mountains. Here the scene suddenly changes from a sandy waste to a verdant and fertile foil; from a scarcity of palatable water to a profusion of crystal springs, and running streams. In this defart barrier, there are found quantities of shells and other productions of the ocean which seem to have lain there for many ages: this, joined to the shelving appearance of the ground, renders the idea very probable that this tract of land hath been won from the sea by the secret operations of Nature. There is indeed no information to be gathered of this event among a people whose annals carry no perspicuity with them beyond the days of their Prophet. But the perpendicular shores of the opposite coast of Africa upon which the waters may have proportionably encroached, are an additional evidence in favour of this opinion. No stranger in traverung this shore could 'possibly conceive her right to the title of Happy. But place him in her middle regions, beneath her balm dropping woods, and amidk her delightful vales, where the fruits of every climate court his safte, and the breezes of Cassia refresh his senses, and he wish pronounce, that the juftly retains the flattering appellation with which the was , honoured by the ancients.'

From Mocha, our Author with his companions embarked on board the Adventure, Captain Bacon, for Suez, at the northern extremity of the Red Sea, from whence they intended to travel by the nearest route to Alexandria, and from thence to proceed with the dispatches by the shortest cut to England. But their intentions, however well formed, were beyond their skill or power to execute. When they were within 150 leagues of Suez, they discovered the breakers a-head, and were alarmed at their very perilous fituation among the rocks and shoals which abound in this narrow fea. Their deliverance was almost miraculous: but they were only preserved from one disaster to conflict with another—equally formidable, and less capable of being supported with refignation and fortitude. The ship was carried out of its proper tract, and our Voyagers found themfelves drawing towards the port of Yambo on the Arabian coast. And now (says Mr. Irwin) did we heartily congratulate ourselves on the conclusion of our troubles. We had heard at Mocha of the hospitality of this port from the very persons who owed to the inhabitants their life and freedom. Nay the very commerce that is carried on between the English and the inhabitants of Judda, which, as well as Yambo, is subject to the Xerist of Mecca, dispelled any doubt which might arise concerning the good faith of these people. We knew that there were several English vessels at Judda at the same time. We had landed a confiderable fum of money at Mocha, which was a present from the Nabob of the Carnatic to the temple of Mecca,

and we doubted not of meeting with the most favourable treatment at a place which is in the neighbourhood of Medina. How dim is the perception of mortals! What avails their boasted fagacity!

The Author makes this reflection when he contrasts their unsuspecting confidence while riding in sight of Yambo, with the treachery and barbarous insult they afterwards experienced from the insidious Vizier, and the designing and rapacious

wretches who shared in his government.

Our Author and his companions were seduced ashore under the promises of protection delivered by a Shaik of a most venerable appearance, in the name of the Vizier. Counting on nothing but what was promised, they readily accepted of the invitation. But they afterwards perceived the black design, and found themselves shamefully betrayed, under the masque of hospitality and friendship. In short, they were made prisoners,—their vessel was seized, and brought into the harbour: and all their hopes were exchanged for the most distressing apprehensions that could harass the human heart.

Mr. Irwin's description of the situation of himself and his companions at Yambo, when some russians of the most infernal aspect stood over them with their matchlocks (by order of the Vizier), ready to revenge the death of any Musilulman that might have been killed by the English aboard the ship when it was first attacked by the Arabs, is so peculiarly interesting, that we know we shall amply gratify our Readers by presenting

it to them.

· \* We heard the report of muskets, but could not diffinguish whether it came from the vessel or the boat. We cannot say positively whether it was a scheme to entrap us, or that the Vizier really supposed our people had commenced hostilities against the Arabs. But so it was. The boat had scarcely reached the shore, when the Vizier fent for our interpreter to complain of the outrage, and to let us know, that we had no right to expect good treatment from him hereafter. It was in vain that we appealed to the testimony of the master of the boat, who came to us of his own accord, and deposed, that our people had not fired at him: that they had only brought him to with a musket, and offered him money for a pilot, which he had refused them. A formal demand was now made of our swords: and we suspected that there was something uncommon in agitation from the whilpers of our guard, and the frequent messengers that came to and fro. One of our company observed a body of soldiers marching towards the place where our vessel lay; and not a slone's throw from us, we saw them unlading a boat of ammunition, which they had transported across an arm of the sea; that runs into the town at highwater. These preparations plainly intimated their designs on the vessel, against which we had previously cautioned the officer to prepare himself. The Adventure carried eight three-pounders, besides Iwivels; and we had not the least doubt of her repelling the whole of their force. But we were unacquainted with the policy of the Arabs, D d 2

who trust to craft for the accomplishment of their wishes, and only

affect resolution when they can do it with impunity.

'The hills now re-echoed with the found of cannon, which we learn was a summons to the neighbouring tribes to join the holy standard which is set up in times of danger. And this was a prelude to a scene that threatened to end very tragically. We were ruminating on the iffue of this extraordinary adventure when the Arabian musketry began to play briskly on the vessel. As a part of the fort skreened the action from our view, we retired to the front-windows. of our apartment, where we could better observe the vessel's motions. I had Thomson's Seasons in my hand, and had inadvertently cast my eyes on the sublime Hymn which crowns that delightful work, when a band of ruffians rushed into the room, and ranged themselves directly before us. Their appearance was rude, and their countenances very different from the people we had hitherto conversed with. They were of the roving race, and promised to prove worthy of the darkpurpose in which they were engaged. The matches of their pieces were lighted, and we tottered on the brink of futurity!-

" The villany of the Arabs was now apparent. They were endeavouring to provoke our mariners to return their fire, and we well knew, that the death of one Mussulman is only to be atoned for by the death of ten Christians. This is a precept of their religion! But the officer on board had reflection enough to confider his countrymen ashore. He felt for our distress; and was so cool as to bear with their repeated infults for the space of two hours, although the mufket balls flew into the veffel, and he was continually urged by the crew to pour a broadfide among the troops, some of whom were daring enough to wade into the fea within pistol shot of the westel. Nay, we afterwards learnt our fituation had been fo critical, that nothing but threats of instant death could prevent the sailors from taking to their arms; and the officer was obliged to parade the deck with a loaded mustet to intimidate them. But it is not strange that we should apprehend other measures. We knew not what steps they had taken to facilitate the seizure of the vessel; or how long the forbearance of our people would last; and we expected an engagement every moment to commence between her and the shore. At this crisis we held a confultation together, and it was unanimously resolved to demand a parley with the Vizier touching the delivery of the wessel into his hands. Our interpreter was dispatched to him with this mortifying concession. The matter was become too serious to be trifled with. We had the evidence of our own eyes to despair of the possibility of the vessel's escape without a pilot; nor could we answer for the blood which might be spilt by a fruitless obslinacy. In this awful interval, I endeavoured to collect myself so as to meet death with a becoming refignation. I breathed a prayer for the welfare of my friends, and could truly fay, that I should have died in peace with all mankind.

A full hour and more did we remain under the alarming circumflances I have described, before we obtained the shadow of a reprieve. The fire of the musketry was still continued against the vessel, and THE MINISTERS OF DEATH STOOD, OVER US, EACH SEEMING TO HAVE SINGLED OUT HIS PREY, IN A FIXT POSTURE AND A MUTE RESERVE!

At length our interpreter returned from his embassy to the Vizier. He was accompanied by three Arabians of distinction, who came to pledge their words for the safety of ourselves and vessel.——A writing was drawn up and signed by them, to the observance of which they swore by their beards, the most solemn oath that a Mussulman can take.

Though our Adventurers were freed from the most threatening alarms, yet their distresses and mortifications were not at an end. After many vexatious delays, they were conducted to the ship under a guard, to wait the event of a message to the Xeriff of Mecca touching their future destiny. Here they were afresh tortured with disappointments of one, kind or another; all which our Author attributes to the persidy of that ingrained hypocrite, the Vizier.

After many delays, and much infult, an order arrived from the Xeriff to discharge the wessel and the crew. The former was sent to Judda, under the charge of an Arabian pilot, and the Author and his sellow-travellers were at length permitted to

proceed in an open boat up the Red Sea.

Here again they were egregiously imposed on by this minister of crast and villany. The boat (after it had made the shore adjacent to Mount Sinai) was run across in the night to the Egyptian coast, and our Author and his companions had the mortification to find, when the Sun rose, that the course of their boat was reversed; and that, instead of Suez, they were in the way to Cosise, a port of Upper Egypt, near four degrees to the southward of Suez. It now struck us (says the Author), that our boat was originally bound for Cosise; and that the Vizier of Yambo had put us aboard for the sake of reserving the major part of the freight to himself; which he actually did reserve by the confession of the Nokidah during the passage. Thus their voyage was interrupted by a long delay, in order to gratify the avarice of this detestable Vizier.

After many embarrassing circumstances at Cosine, our Travellers set out with the caravan for Chinnah (a town on the river Nile), under the care of the Shark's son. The occurrences of this route are well related, though they were not very numerous or interesting. Arabian persidy, the intense heat of the barren desart, extreme thirst and satigue, are the principal subjects of complaint with our Author.

After having escaped a snare laid for them by the young Shaik, they at length arrive at Ghinnah. Here a sresh scene of rapine and duplicity commenced. They were lodged in the house of one Alty, who proved treacherous to them; and who, in conjunction with another scoundred of a Vizier, attempted to cajole them out of their essents and money. In this house Dd 3 (which

(which first promised them protection, and every convenience to relieve their toils) they were made close prisoners. Their baggage was searched, and repeatedly pillaged by the host and his associates. After a variety of disagreeable and vexatious occurrences, the Great Shaik, or Shaik Ul Arab, whose territories in this country are very extensive, arrived at Ghinnah, to the great satisfaction of our Traveller and his companions. This excellent man minutely enquired into their circumstances; and, with a justice that would have done honour to a Christian governor, he immediately proceeded to the noble duty of redressing the wrongs of the injured strangers whom treachery had thrown into his dominions.

The character of this upright and impartial legislator is well drawn in the present work. We will give it in Mr. Irwin's own words.

' Isman Abu Ally, the Great Shaik of the Arabs, is a short, fat man, of about five feet two inches high, and turned, as we learn, of seventy five. His eyes are grey, and his complexion very fair; but what at once gives him a fingular and more youthful look, his beard, which is very bushy, is coloured of a bright yellow. This exterior may not feem the most promising, and might create distaste, if the benevolence that beams from his countenance were not foremost to fecure the heart of the beholder. Neither can the shrillness of his voice, which is harsh and dissonant, destroy the beauty of the sentiments which it is insufficiently made use of to convey; as the elegance of the words may sometimes atone for the demerits of a tune. He is still active for a man of his fize and age: and his spirits are so good, that were it not for the ravage that time hath made among his teeth, he might pass for a younger man, by twenty years at least. Except the Viziers of Yambo and Ghianah, whom we had found to be villains by sad experience, we had hitherto dealt with the dross of It was referred for this moment, for us to meet with the nation. the polite gentleman and the honest man, comprized in the person where they ought to be found-in the representative of his people. Happy the subject of a virtuous land, who at once possesses and imitates fo rare an example! But how funk in the abyss of infamy are the race who wholly deviate from the standard of rectitude, and though daily reproached by the life of their monarch, are not to be

reclaimed by the tone of authority, or the elocution of active virtue!

We had quickly cause to find, that we had not given the Shalk too much credit for his integrity. His impatience to acquit himself in our opinion, of any connivance at the conduct of his servants, could scarcely be restrained by the forms of civility, which precluded business during our repast. But no sooner was it ended, than he shifted the conversation, and came directly to the point which we were so much concerned in. He lamented the treatment which we had undergone, and which could only have happened in his absence:

Our Author and his companions were policely feated on a carpet by the Shaik, and regaled with coffee, fruits, &c.
 and

and he vehemently reprobated the behaviour of his officers, which he

was determined to punish in the most exemplary manner.

This promise from the venerable Shaik was punctually exe-, 'Our triumph (says the Author) was complete. One of our ancient enemies had atoned for his crime in a manner that outwent the most sanguine idea of revenge \*. The other was humbled at our feet. He furvived, indeed; but it was only to abase himself before us, and to depend on our modera-

tion for his fecurity!'

As the contending parties of Ismael Beg raged with great violence near the Nile, our Author and his fellow-travellers: thought it most prudent to avoid them, by taking the route of the caravan through the Defarts of Thebais. There were few. objects of consequence to engage their attention in this forlorn and dreary wilderness. The few that did occur are carefully noted by our Author-particularly, his adventure with a band of Arabian robbers. These banditti were headed by a Captain, who fortunately knew the mafter of the camels that carried our Traveller's baggage; and who, with a generofity that would have done credit to a more respectable prosession, pledged his faith for their protection, and inviolably adhered to his engage-This is an interesting part of the present work; but our limits will not permit us to transcribe it.

Our Author arrived at Grand Cairo, and from thence proceeded up the western branch of the Nile to Rosetto. His account of the Delta is entertaining. From Rosetto they proceeded to Alexandria—the great emporium of Egypt: and after giving a pleasing account of this city and the adjacent country, and a fingular relation of some English sailors, who ascended the noble pillar of Pompey, and regaled themselves on the top of it with a bowl of punch, the Author concludes the Work with a

brief account of his embarkation for Marseilles.

The Postscript contains an extract of a letter from Mr. Hammond, one 6 of the number (fays Mr. Irwin) of the unlucky subjects of these Adventures, who has possessed resolution enough to hazard the dangers of an inhospitable shore, and to return to India by the route of Egypt.' The letter is dated from Grand Cairo, Aug. 20, 1779; and, after a brief recital of the revolutions that have lately affected the government of the country, he relates a circumstance that awakens Mr. Irwin's sympathy into the most plaintive accents of exclamation! 'The

politica

This was a merchant, who accompanied our Travellers from Couse to Ghinnah; and having shared in the plunder of their effects with his perfidious brother, their hoft, was afterwards murdered in the Defart, by a villain who envied him his spoils. This murder was encouraged by the young Shaik of Confe.

politics (says Mr. Hammond) of this country have been a good deal changed since we left it. It seems, that soon after our departure from Cairo, Ibrahim Beg and Morad Beg were brought back to Cairo, accompanied by our old friend Isman Abu Ally (the Great Shaik), who was with Mr. Baldwin [the English Consul], and made several enquiries after us. For this effential service the poor old man had his head taken off by Morad Beg, about three weeks ago, who was at Ghinnah in pursuit of Hasseim Beg, one of Ismaul Beg's partizans!

On this affecting event, Mr. Irwin's spirit catching a poetic spark, sends it very gratefully to the hallowed tomb of him whose goodness had enkindled it. 'Unbroken be the reed which moans thy loss, rich pearl of Araby! Sweet smelling like the gums of Aden's vale, to heaven ascend thy precious

fpirit!

The Appendix contains two Odes, the first to the Desart the second (by way of contrast) to the Nile.—These odes have no great excellence either in point of sentiment or expression.

The fecond is the best; and will be esteemed pleasing.

On the whole, this performance is very entertaining; nor is it deficient in moral and useful reflections to render it instructive. The Author writes like a good man. An amiable heart discovers itself throughout; and were it less valuable in point of composition than it really is, the benevolence of the Author would entitle it to our candour, and gain our respect.

Impartiality, however, obliges us to acknowledge, that the *Jeries of adventures* related in this work, is in many places too uniform to gratify the curiofity of the Reader. The recital of Mahometan perfidy becomes at length tedious, and confequently

loses its effect.

When the Author's narrative is related in a plain and simple style, it is peculiarly pleasing and engaging. When he swells his language into poetic profe (which is frequently the case) he disguises the beauty of truth in the gaudy trappings of art; and disgusts where he meant to entertain. The assuitur pannus, &c. of Horace was never more strongly illustrated than in the account (otherwise interesting and pleasing) which Mr. Irwin hath given of the Xeriff of Mecca. 'His honours are heredi-To possess which, he must prove his descent from the Prophet: and the extent of his influence reaches as far beyond that of the Pope's as the persussion of Mahomet beyond the Papal tenets. The remotest corners of the East pay homage to the title: the way-worn pilgrim ceaseless toils from Tesli's tow'rs, or Mesopotamia's waste, to add his little mite to the treasures of Medina's temple, which Astatic princes, Subaha of Ind, and Sultans of the Spicy Isles, which weatward bound the Southern Ocean, enrich the Prophet's shrine with gems and gold. The large fum of money which our vessel brought for the service

of the Mosque, as a peace offering from the Nabob of Arcot, on the decease of his daughter, is a corroborating evidence of the enthusias of Mussulmen. It amounted to one lack and a half of rupees, which is near 20,000 l. sterling, and was the gift of a prince, whom the world is not to be told is so involved in debt as not to require this drain to exhaust his mortgaged revenues.

We do not produce this passage for any invidious purpose abut entirely with a view to serve our Author in any suture publication. His good understanding must soon convince him, that this affected mixture of simple narrative and instated description is a blemish in his work, and ought most carefully to be avoided by every writer who aims at the approbation of the sensible and judicious class of readers—such as Mr. Irwin wishes to please; and such as, we think, with care and attention, he is well quartified to please.

N. B. Mr. Irwin, in a future edition \* of this work, will be careful to correct a verbal error in the first page of his Preface, where the word deprecate is used in a most improper and even contrary sense.

ART, II. A Treatise on the Military Science; which comprehends the grand Operations of War, and general Rules for conducting an Army in the Field, founded upon Principles for the Improvement of the same; with occasional Notes. To which is added, the Manner of attacking and defending Military Posts, Villages, Church-yards, Mills, Houses, &c. Dedicated (by Permission) to his Majesty. By Thomas Simes, Esq; late of the Queen's Royal Regiment of Poot, one of the Governors of the Hibernian Society for the Orphans and Children of Soldiers; Author of the Military Medley, Military Guide, Military Course, and Military Instructor. 4to. 13 s. Boards. Almon. 1780.

HE art of war was undoubtedly a very early study, and nearly coeval with the creation; for we find, that, in the time of Adam, when there were but very sew people on the earth, and consequently men had no reason to quarrel for want of elbow-room, they began to disagree, and determined their

disputes by the principles of war.

Many inflances might be brought to prove, that the art of war was cultivated, and well understood, in the most early ages of the world; and we might also subjoin numberless examples, sufficiently authenticated, to prove that succeeding ages did not suffer that knowledge to be lost for want of practice. Even the establishment of Christianity, though expressly sounded on brotherly love and affection for one another, contributed very little

<sup>•</sup> We are informed, that a fecond, if not a third, edition of this work hath appeared fince our Review of it was drawn up.

towards

towards retarding the practice and improvement of this most noble art. But flattering ourselves, as we do, that our readers have so much confidence in us as to believe that we could produce these examples if it was necessary, we shall proceed to remark, that the greatest improvement which this stupendous scieence received, was in the invention of gunpowder, which, as Polydore Virgil relates, was about the year 1380 of Christ, by Bartholdus Shwartz, a learned Franciscan Monk, who having applied himself to chemical investigations, happened to mix together (for some particular purpose) such ingredients as gunpowder is compounded of, viz. saltpetre, sulphur, and char-This composition being put into a mortar, and covered with a stone, happened to take fire, and blew off the stone to a The monk was at first greatly surconfiderable distance. prifed, and possibly much frightened also; but recovering himfelf, he soon discovered some of those particular uses to which it was afterwards so successfully applied. Thevet says, the inventor here spoken of was a monk of Fribourg, named Constantine Mielsen: but Belleforet, and other authors, with more probability, hold Schwartz to be the inventor. Be this as it may, thus much is certain, that Schwartz first taught the use of it to the Venetians, in the year 1380, during the war with the Genoese; that it was first employed by them in a place called Fossa Clodia, against Lawrence de Medicis; and that all Italy complained of it, as a manifest innovation on the rules of Lawful warfare.

But what contradicts this account, and shews gunpowder to be of an older date, is the fact mentioned by Peter Mexia, viz. that the Moors being belieged in 1343, by Alphonfus XI. king of Caftile, he discharged a fort of iron mortars upon them, which made a noise like thunder. And this is seconded by Don Pedro, bishop of Leon, who relates in his Chronicle of King Alphonfus, that in a sea combat between the king of Tunis and the Moorish king of Seville, above 450 years ago, those of Tunis had certain iron tubs, or barrels, with which they threw thunder-bolts of fire. Du Cange adds, that there is mention made of gunpowder in the registers of the chambers of accounts in France, as early as the year 1338. To say no more, it appears that our countryman, Roger Bacon, knew the ingredients of which gunpowder is compounded 100 years before Schwartz, was born. That excellent philosopher mentions the composition in express terms, in his treatise De Nullitate Magia, published at Oxford in 1316, twenty-four years after the author's death. "You may (says he) raife thunder and lightning at pleasure, by only taking sulphur, nitre, and charcoal; which fingly have no effect, but, mixed together, and confined in a close place, cause a noise and explosion greater than that of a clap of thunder." The

The art of war is divided into various branches, and denominated according to the nature of the subject on which it is employed. Thus, war in general is a contest or difference between princes, states, or large bodies of people, which not being determinable by the ordinary measures of justice and equity, is referred to the decision of the sword. A state of warfare, in the opinion of Hobbes, is the natural state of man; this, however, is denied by most other politicians, who hold war to be a preternatural and extraordinary state. With regard to the subdivisions of war, mentioned above, it is divided into civil or intestine war, which is that between subjects of the same realm, or between parties in the same state. In this sense we may say, the civil wars of the Romans destroyed the republic; the civil wars in Granada ruined the power of the Moors in Spain; the civil wars in England began in 1641, and ended with the kings death in 1648.

Another subdivision of general war, is that kind of contest used when particular lords were allowed to make war with one another, to revenge injuries, instead of prosecuting them in the ordinary courts of justice. This privilege was sometimes suspended, especially in the king's war, bellum regis. This appellation, king's war, was given to such war as the king declared against any other prince or state; on which occasion the lords were not allowed to make private war against each other, as being obliged to serve the king with all their vassals. The contests about religion have produced another subdivision of garderal war, denominated religious war, which is usually maintained in a state on account of religion, one of the parties resusing to tolerate the other. To these divisions of war we may likewise add that of the boly war, which was anciently maintained by leagues and croisades for the recovery, as they termed it, of the Holy Land.

Having thus shewn that the art of war is the most extensive and useful science imaginable, it will follow that every consistent attempt to facilitate the understanding of it must meet with a favourable reception, not only from those who are desirous of attaining a competent knowledge in it, but likewise by such as have already made a considerable progress in the art of Tactics; and our opinion in this particular seems in some measure consistency by the very copious list of subscribers to the work now before us, among which are some of the most illustrative are some as a six be kinder.

trious personages in the kingdom.

Mr. Simes, the ingenious author of this treatise, which is in-

Mr. Simes, the ingenious author of this treatile, which is intended to comprehend all the grand operations of war, feems to have derived many of the rules here given from his own experience when in actual fervice: these he has delivered, amongst a multitude of curious observations made by others; by which

means he has rendered his performance very entertaining to every one, as well as useful to those who are immediately concerned in the art of war.

In treating on the articles of sublistence, sutlers, beer, spirits, &c. Mr. Simes very fensibly remarks, 'that the sole cause of the great defertion in our army is owing to the very poor pittance which the foldiery receive; for after the feveral deductions are made, it will appear (fays Mr. Simes) that in some corps the foldier does not receive more than five guineas and a half to subsist on for the whole year: but however distressful this may appear, and however improper to be introduced under the head of such articles as I am now treating of, yet I cannot drop the subject (continues he) or write without the feelings of an old subaltern, which station I was long in. I shall therefore here present my readers with a scheme of an ensign's confant expence, compared with his yearly income.

Scheme of an Ensign's constant Expence.

N. B. Neither cloaths nor pocket-money included.

 Besides this, when in barracks, there will be an additional expence for washing of sheets, pillow-cases, bed-curtains, towel, and bed-rug.'

Mr. Simes, from this calculation, proceeds to shew how inadequate the pay of an enligh is, to support the character, and to represent to his readers the distressed condition, of a soldier, Though my inclination and my heart (fays Mr. Simes) feels for the enfign, yet I want words to do justice to the character, in -order that that august assembly (we suppose he means one or both houses of parliament) may be induced to relieve their wants, and put them upon a more respectable sooting with respect to pay, which, from the colonel downward, is by much too little,

as every one must allow, who considers that the present pay was established above a century ago, at which time it was

worth near three times its present value.

I have heard it said (continues he) that the salaries of the judges are raised on account of the dearness of travelling, &c. I do not disapprove of the measure; their dignity and consequence ought to be supported. Why then are not the colonel's pay, and those downwards, augmented also? Have they (the judges he means) more merit than the military? Do they go through more satigues and hardships? Do they hazard more climates? Do they fight more battles? Do they do more good for their country? Why then are so honourable, so deserving, and so respectable a part of the community to be thus neglected? The consequences are, that we daily see a number of excellent offi-

cers felling out.'

We cannot readily subscribe to the truth of this extract, for this very obvious reason, that although general commanders, either in the army or navy, may be supposed to rank with the judges, and confequently admit of a comparison with them, we believe it will be certainly found, upon strict enquiry, that more commanders in the army have made immense fortunes by their profession, than judges have by the law. We may instance in a Marlborough, a Clive, an Albemarle, and may we not add a Howe? all within our own memory. It is true, if we descend to the lower orders in each profession, the comparison will no longer hold good. Attornies in the law, and non-commissioned officers, bailiffs and private foldiers in the army, are certainly not upon equal terms. In these ranks the former have greatly the advantage of the latter, it being well known (to the cost of many) that the attornies (those learned-unlearned gentlemen, as the Spectator very properly calls them) frequently receive as much for scribbling a stupid letter of ten lines, as a subaltern in a marching regiment does for his whole day's duty.

Mr. Simes strongly recommends to the attention of the young officer a moderate knowledge in several branches of speculative science; for, says he, 'notwithstanding a general may obtain sufficient light into the principal parts of his profession, by confuling that experience which is gained in armies, by employing his own industry, and by making the necessary enquiries; yet there are others which require skill and knowledge, and some acquaintance with the rules of theoretical science; especially with those of geometry and astronomy. And without having recourse to the more difficult branches of these two sciences, there are certain parts of them, which, though they require little labour to attain, are of the greatest use.' Accordingly, in treating of camps, he remarks, that 'men, in general, form their opinion of the size of a camp or of a city, from the

circum.

circumference only; and when they are told that a camp, or a city, Megalopolis, for example, contained fifty stadia in circumference, and Lucedamon only forty-eight, and yet that this latter city was twice as large as the former, they know not how to believe it. And if any one, defigning to increase the surprise, should affirm that it is possible for a city or camp, which contains only forty stadia in circumference, to be twice as large as another which contains one hundred, they are struck with the greatest astonishment. The cause of this surprise is, that men forget those principles of geometry which they learned in their youth. I was the rather inclined (fays he) to take some notice of these things, because it is not the vulgar alone, but some even of those who are employed in the administration of state, or placed at the head of armies, who are sometimes assonished, and not able to conceive that Lacedæmon might have been a much greater city than Megalopolis, though it was less in its circumference. In the same manner, likewise, they are persuaded, that, by only reviewing the circumference of a camp, they can eafily determine the number of the troops which it contains. Mr. Simes adds, ' Let this then ferve as a leffon to those perfons, who, though they are so ignorant as not to conceive how these things can be, yet nevertheless are desirous of commanding armies, and of presiding in the government of states.

We cannot help remarking here, that, notwithstanding the severity of Mr. Simes's censure, the principle on which his argument is founded is not so extremely obvious. Neither can we persuade ourselves that the comparative magnitude of the two cities, here spoken of, related wholly to the ground on which they flood, as he supposes. The magnitude of cities is generally reckoned from the number of their inhabitants, and not from the space which they occupy. And this may proceed either from the greater closeness of the buildings in one than in the other, or from the greater number of inhabitants that one house contains. Beside, if we suppose the city of Lacedæmon to have been a square of twelve stadia in each side, and a square is the most capacious four-sided figure that can be formed under the same circumference, it may easily be shewn, that if the perimeter of Megalopolis was fifty stadia, and contained but half the space which the city of Lacedamon did, that its length must be about 213 stadia, whilst its breadth could be no more than about 31 stadia. A disproportion which is not probable to have

existed in the formation of it.

With respect to the knowledge which our author thinks it is necessary for a general to have in astronomy, he observes, that one of the most necessary articles is, 6 to be able to investigate the theory of the days and nights. If indeed, fays he, 6 the days and nights were at all times equal, there would be no need

of study in order to acquire knowledge which would in that case be common, and obvious to all. But since they are dif-ferent, not only each from the other, but also from themselves, it is plainly a matter of great importance to know the laws by which they are feverally diminished or increased: for unless he be acquainted with the differences, how shall a commander be able to measure with exactness the time of a concerted march. either by night or by day? How can he be assured, without this knowledge, that he shall not either arrive too early or too late? It happens also on such occasions, and indeed on such alone, that the first of these mistakes is more dangerous than the other ; for he who arrives too late, is only forced to abandon his defign on perceiving his error, while he is yet at a distance, and may return back again with fafety: but he who comes before the appointed time, being discovered by the enemy upon his approach, not only fails in his intended march, but is in danger also of suffering an entire defeat. It is time, which indeed principally governs in all human actions, and most particularly in the art of war. A commander, therefore, should be perfectly acquainted with the time of the summer and winter folflices, the equinoxes, and the different degrees of the diminution or increase of the nights and days, as they fall between the equinoxist points. For this is the only method that can enable him to adjust his motions to the course of time.' After being well acquainted with the definitions here specified, our Author recommends a farther progress into practical astronomy. For it is not less necessary for a commander to know distinctly the several portions of the day and night, in order to determine the proper hour of rising, and putting the troops in motion; for, without beginning well, it is impossible to obtain a happy end.

Now the time of the day may be easily known by the shadow from the sun, by the course which the sun takes, and by the different degrees of his elevation above the earth. But it is not so easy to distinguish the time of night, unless to those who are versed in the doctrine of the sphere, and are able to follow the course of the twelve signs, and to mark their disposstion in the heavens. With this knowledge it is a matter of no difficulty; for though the nights are unequal, yet in the course of every night fix of the twelve figns are raifed above the horizon; it necessarily follows, that at the same times of the night, equal parts of the twelve figns must always appear. When it is known, then, what part of the zodiac the fun occupies in the day, nothing more is required than, at the time of his fetting, to draw a line diametrically through the circle: when this is done, as much as the zodiac shall afterwards rise above the horizon, so much of the night will be also known. When the nights are cloudy, recourse must be had to the moon; for this planet planet is of such a magnitude, that in whatever part of the heavens it may happen to be, the light of it may always be discerned. It is sometimes from the time of its rising, and sometimes from those of its setting, that the hours of the night are to be computed. But it will first be requisite to know, with exactness, the different times of its rising upon each several day; nor is this knowledge difficult to be obtained, for, as the course of the moon is completed in a single month, the right apprehension of the progress in that period will serve equally in all the rest.'

How the Author felt himself, on finishing this elaborate piece of astronomy, we cannot tell; but if his feelings were any thing like our even after reading it, we scruple not to declare, that his head must have been in the same condition which our uncle Toby's was, after attending to his brother Shandy's explanation of Locke's Idea of Duration. His meaning is, however, good, as will more plainly appear from the following very signal instances' which he gives of miscarriages that have happened from a general's want of this kind of knowledge.

" Cleomenes, the king of Sparta, when he had resolved to make an attempt upon Megalopolis, agreed with some of the garrison, who were stationed upon that part of the wall that was called Colorum, that he would come with his forces in the night, about the time of the third watch; for this was the hour in which these men were appointed to take the guard. But not having before considered, that at the time of the rising of the Pleiades, the nights were extremely short, he did not begin his march from Lacedæmon till about the setting of the sun: it was therefore full day before he arrived at the destined place. He had the rashness, however, to attempt to storm the city, but was repulled with difgrace and loss, and was even in danger of fuffering an entire deteat. Whereas, on the other hand, if he had been only exact in the computation of the time, his friends might have secured his entrance into the city, and the defign might have been attended with success.

Thus again, King Philip, when he attempted to take Melite, was guilty of a double error: for not only the ladders which he carried were too short, but he sailed also with respect to time; for, instead of coming to the place in the middle of the night, as had been concerted, when the people would have been all sast assessment he began his march from Larissa at an early hour; and having entered the territories of the Meliteens, as it was neither safe for him to halt, less the enemy should gain notice of his approach, nor possible to return back again without being perceived, he was compelled by necessity to advance, and arrived at the city before the inhabitants were gone to rest: but as he could not scale the walls, because the ladders were not proportioned

15

proportioned to the height, so neither was he able to enter through the gate, because the time of the attack prevented his friends that were in the city from favouring his entrance. last, therefore, having provoked the rage of the inhabitants, and loft many of his men, he was forced to return back without accomplishing his purpose; and instructed all mankind, for the time to come, to be suspicious of his designs, and to set themselves on their guard against him.' To this example our Author adds another of the same kind, in the case of Nicias the Athenian general, 'who having found a fair occasion for drawing his army from the siege of Syracuse, made choice of the proper time of night, and had retreated to a fafe distance undiscovered by the enemy, when it happened that the moon was fuddenly eclipsed. Being struck by this event, and vainly imagining that it portended some missortune, he immediately suspended his march. The consequence was, that when he designed to continue his retreat on the following night, the Syracusians having now gained notice of his motions, fell upon him as he marched, and rendered themselves masters both of the army and leaders. And yet, if he only had enquired of men that were acquainted with these matters, he might not only have not lost his own proper time, but have rendered the accident itself subservient to his purpose, on account of the ignorance of the enemy. For the ignorance of others is the furest way of conducting skilful men to the accomplishment of their designs. It is manifest then, that so much of astronomy should be acquired, as may be necessary upon such occasions: and in order to obtain success in military operations, the studies of astronomy, geometry, and mathematics, are absolute necessary to complete the general.'

We perfectly agree with the ingenious writer in opinion, that a competent knowledge in mathematical learning, especially in the practical parts of it, is effentially necessary to every one whose situation is above the lower orders of mankind, and inuch more so to those who are in that line of life, which may possibly lead them to the management of the higher concerns of human affairs, such as sharing in the administration, commanding of fleets, armies, &c. or being employed in other important national business. But after all that can be said, half the misfortunes that are here recited could not possibly happen in our age, unless to the lack of astronomical knowledge, the general add forgetfulness also, and leave his watch behind him at his bed's head. Accurfed be those clocks and watches! They will, in the end, be the ruin of all science! so that a man shall not be able to thrust a morsel, with propriety, into any one calling or concern in human life; and it will be well, if REV. Dec. 1780.

in time to come, the science of astronomy, any more than the

fuccession of our ideas, be of any service to us at all.

The stratagems made use of in war, to draw the enemy into an ambuscade, are innumerable; a sertile genius (says Mr. Simes) will vary them almost to infinity. A very common one,

and which seldom fails of success, he thus describes:

"Detach an officer, with a small party, to insult the enemy, with orders to retire when pursued, and by that means gradually decoy his pursuer into a defile, both fides of which are lined with infantry. But in attempts of this nature, your main body must be so near your ambuscade, as to be ready to support them, in case the enemy should have perceived your defign, and fall upon their rear. The officer who advances must march very flow, lest his horses should be out of wind before he begins his retreat. If he falls in with any waggons in fight of the enemy, he must appear to plunder them; but lest no such opportunity should happen, it may not be improper to cause a few waggons to proceed from a neighbouring village for that purpose; and if this will not do, he may then appear to have advanced with an intention to discover the position of the enemy: and if they should continue inflexible, he may attack their advance guard.' Another method of decoying the enemy into an ambuscade (our Author says) is, to send forty or fifty men into a village, not far from their camps, whilst you take post, with your whole detachment, on the out-skirts, so as not to be perceived by the inhabitants. The officer who is sent into the village must dismount his troop, but not suffer his men to quit their horses. He will then assemble the bailiff and peasants, and order them to provide a certain quantity of forage, which they are to transport in three or four hours from that time. His next business is, to detach some of them to the neighbouring villages, with the like orders, with politive commands not to give the enemy intelligence of his being there; or in case they should be obliged to own it, to report his party much stronger than it is. These messengers being dispatched, he must fuffer no one to leave the village. In the mean while, he will collect as much forage as possible. His videts are to be so posted, as to give intelligence of the enemy's approach, and the main body are to continue in their ambuscade, in the out-skirts of the place.

When the enemy appears (which they will not fail to do) he must endeavour to carry off his forage, till he has drawn them to the place prepared for their reception; upon which he will face about, and stop them, till the troops in ambuscade

have time to attack them in flank.

Our Author speaks highly of redoubts, and of their use to an army drawn up in order of battle; and very judiciously supports Imports his opinion on this head by the testimony and practice

of the greatest generals that Europe has produced.

In the wars between Charles XII, king of Sweden, and Peter the Great, Czar of Muscovy, the former of these illustrious heroes (Mr. Simes observes) was always victorious before the satal battle of Pultowa. The superiority he had constantly before maintained over the Muscovites is almost incredible: it was no unusual thing for 10 or 12,000 Swedes to force intrenchments desended by 50, 60, or even 80,000 Muscovites, and to cut them to pieces. They never enquired after their numbers,

but only after the place where they might be found.

The Czar Peter, who was the greatest man of his age, bore the bad success of that war with a patience equal to the greatness of his genius, and still persisted in fighting, on account of exercising his troops, and inuring them to hardships. In the course of his adversities, the king of Sweden laid siege to Pultowa: upon which the Czar called a council of war, where it was a long time debated, and various opinions were given, concerning the step most proper to be taken in this exigency. Some were for furrounding the king of Sweden with the Muscovite army, and throwing up a large intrenchment, in order to oblige him to surrender. Others were for burning all the country within 100 leagues in circumference, to reduce him by famine; which opinion was far from being the worst, and was also most conformable to that of the Czar. Others, however, objected to it, by observing, that it could never be too late to have recourse to such an expedient; but that they ought to hazard a battle, because the town and its garrison were in danger of not being carried, by the invincible obstinacy of the king of Sweden, where he would find a large magazine, and a sufficient supply of every thing to enable him to pass the desart with which they proposed to surround him. This being at length the determined opinion of the council, the Czar thus addressed him-

"Since we have come to a resolution to fight the King of Sweden, nothing remains but to agree about the method, and to make choice of that which promises the most success. The Swedes are well exercised, well disciplined, adroit under atms, and impetuous in their charge. Our troops are not inferior to them in point of resolution; but they certainly are in many other respects: it therefore becomes necessary to fall on some scheme that may render this superiority of theirs useless to them. They have frequently forced our intrenchments, and have always deseated us in the open field by dint of art, and by the facility with which they form their manœuvres. In order, then, to counterbalance these advantages in the enemy, I propose to draw near to him; to throw up several redoubts in the front of

our infantry, with deep ditches before them; to fraile and pallifade them, and to defend them with infantry; and after having erected those works, which will not require above a few hours labour, to wait for the enemy with the rest of our army behind them. He must infallibly be broken in attacking them, must lose great numbers, and will both be weakened, and in great disorder, when he attempts to pass the redoubts to charge us; for it is not to be doubted that he will raise the slege to engage us, as soon as he perceives that we are within his reach.

We must therefore march in such manner, as to arrive before him towards the close of the day, that he may be thereby induced to defer his attack till the day following, and take the

advantage of the night to erect these redoubts."

Thus spoke the Sovereign of the Russians, and all the council approved of the disposition. Orders were given for the march, for tools, fascines, chevaux-de-frize, &c. and towards the evening of the 8th of July, 1709, the Czar arrived in the presence of the King of Sweden. This prince, although he was wounded at that time, nevertheless informed his general officers, that he intended to attack the Muscovite army the day following; and accordingly, having made the necessary dispositions, and drawn up his troops, he marched a little before day-break.

The Czar had thrown up feven strong redoubts in his front, with two battalions posted in every one, behind which was all his infantry, having its flanks covered by his cavalry. In this disposition, therefore, it was impracticable to attack the Muscovite infantry, without having first carried the redoubts, because they could neither be avoided, nor was it possible, at the same fitne, to pass between any two of them, without being destroyed by their fire. The King of Sweden and his generals remained totally ignorant of this disposition till the moment they saw it. But the machine, as it were, having been once put into motion, it was now impossible to stop it. The Swedish cavalry presently routed that of the Muscovites, and even pursued them too far; but their infantry was stopt by the redoubts, which made an obstinate resistance. Every military man knows the difficulty that usually attends the taking of a good redoubt; that it requires a disposition on purpose; that a great many battahons must be employed, in order to be able to attack it in several places at once; and that after all, their success is extremely uncertain. Nevertheless, the Swedes carried three of those, although it was with great difficulty; but they were repulsed at the others with great flaughter. All their infantry was broke and disordered, while that of the Muscovites, being drawn up in order at the distance of 200 paces, beheld the scene with great tranquillity. The King and the Swedish generals saw the danger in which they were involved; but the inactivity of

the Muscovite infantry gave them some hopes of being able to make their retreat. It was absolutely impossible for them to do it with any regularity, for they were totally in confusion. However, as it was the only remaining step they had to take, after having withdrawn their troops from the three redoubts they had carried, and from the attack of the others, they proceeded to put it in execution. In the mean time the Czar called together his general officers, and asked their advice concerning what was to be done at this conjuncture; upon which Monsieur Alert, one of the youngest among them, without even allowing time to any of the others to declare their fentiments, thus addressed himself to his sovereign: 'If your Majesty does not attack the Swedes this inflant, they will be gone, and you will lose the opportunity.' This being acceded to, the line advanced in good order through the intervals between the redoubts, leaving them guarded, to favour their retreat in case of accident. Swedes had but just halted to form their broken army, and to restore it to some order, when they saw the Muscovites at their heels. Nevertheless, confused as they were, they made an effort to return the charge; but order, which is the foul of battle, being totally wanting, they were dispersed without op-The Muscovites not having been accustomed to conquer, were afraid to pursue them; so that the Swedes retreated to the Boristhenes, where they were afterwards taken prisoners.'

In treating of the manner of engaging the enemy, Mr. Simes observes, ' that when two armies arrive within a certain distance of each other, they both begin to fire, and continue their approaches, till they come within about forty or fifty paces; where, as is usually the case, either one or the other takes to flight; and this is what is called a charge. It may indeed be thought extraordinary, that they should not be able to make a better; I look upon it, however, as an impossibility, without the use of the cadence \*. But let two battalions which are to engage each other, march up with straight ranks, and without doubling or breaking, and fay which of them will gain the victory; that which gives its fire in advancing, or the other that referves it? Men of any experience will, with great reason, give it in favour of the latter: for, to add to the consternation into which the former must be thrown, in seeing their enemy advancing upon them, through the smoke, with his fire reserved, they will be either obliged to halt, or at least to march very slow, till they have loaded again; during which time they are ex-

Our Author explains, in another place, what he means by cadence, viz. a kind of measured march, dependent on the drum and fife; by which means every man keeps his proper rank and distance, whether they march with greater or less celerity.

E e 3 poss

posed to a dreadful havock, if he enlarges his pace, and falla

upon them before they are ready again.'

From this extract Mr. Simes seems clearly of opinion, that it will eventually be more advantageous to receive the enemy's first fire. And in this remark he appears to be justified by the observations of that great general, Marshal Count Saxe, who, in his Memoirs upon the Art of War, informs his readers, that he was himself an eye-witness, at the battle of Belgrade, of two battalions being cut to pieces in an instant, owing, entirely, to their not waiting to receive the enemy's first fire; of which the following is an exact relation:

66 Being surrounded (fays the Marshal) by a thick fog, which rendered it impossible for us to discern any thing; a strong blast of wind suddenly arose, and dispersed it, when we immediately saw the battalion of Lorrain, and that of Neuperg, upon a hill called the Battery, and separated from the rest of our army. Prince Eugene, at the same time, discovering a party of horse in motion upon the fide of the mountain, asked me if I could distinguish what they were? I answered, Thirty or forty Turks. Then, replies he, those two battalions are undone. At which time I could perceive no appearance of their being attacked; not being able to see what was on the other side of the mountain: but galloping up at full speed, I no sooner arrived in the rear of Neuperg s colours, than I saw the two battalions present. and give a general fire upon a large body of Turks, at the diftance of about thirty paces; instantaneously after which, the Turks rushed forward through the imoke, without allowing them a moment's time to fly, and with their fabres cut the whole to pieces upon the spot. The only persons who escaped were Mr. De Neuperg, who happened luckily to be on horseback; an enfign, with his colours, who clung to my horse's mane, and incumbered me not a little; and two or three privates. At this instant came up Prince Eugene, almost quite alone, being attended only by his body-guard; but the Turks, of their own accord, retired. Here the Prince received a shot through his sleeve. Upon the arrival afterwards of some cavalry and infantry, M. Neuperg defired a detachment to secure the clothing: upon which fentries were immediately posted at the four angles of the ground occupied by the dead bodies of the two battalions; and their clothes, hats, shoes, &c. collected in heaps together; during which time I had curiofity enough to count the number of Turks which had been destroyed by the general discharge of the two battalions, and they amounted to no more than thirty-two; a circumstance which has by no means increased my regard for these firings."

Throughout the whole of this performance, the ingenious Author illustrates his subject, and at the same time entertains his readers,

readers, with many curious anecdotes, and pleafing relations of stratagems which have been made use of by the most illustrious generals and commanders, extracted from ancient and modern

history; one or two of which we shall here select.

" Philip, King of Macedon, rendered himself master of Prinassus, after he had almost despaired of success, from the impracticability of carrying on his works, in an extremely rocky, and almost impenetrable soil, by the following stratagem: He ordered the foldiers to make a great noise under ground, in the day time, as if they were employed in digging the mines; and in the night to bring earth from different parts, and to lay it along the mouths of the pits that were opened; that the befieged, on feeing a large quantity of earth, might be struck with apprehensions of their danger. At first, however, the inhabitants displayed a great shew of bravery, and seemed determined to maintain themselves in their posts. But when Philip informed them, by beating a parley, and fending them a letter, faying, that the wall was undermined to the length of 400 feet; and that he left it to their choice, whether they would now retire with safety, or remain till he should set fire to the props, and be then destroyed amidst the ruins of the place; in less than five minutes they gave an entire credit to this account, and delivered up the city.

Gonsalvo, who was Lieutenant-general to Spinola, and Governor of Milan, in 1624, intending to possess a little walled village in the Palatinate, called Ogersheim, dispatched an officer, at the head of some troops, upon that errand. On the first alarm, nine-tenths of the inhabitants removed to Manheim, leaving behind them about twenty infignificant people, and a poor shepherd, who, besides being a brave fellow, was a man of humour. The shepherd in good time fastened the gates, let down the drawbridge, and made a wonderful shew for resistance. A trumpeter accosted the village in form; upon which the few inhabitants that remained made their escape through a postern gate, and left only the shepherd, and his shepherdess, big with child. This unaccountable pealant, in the style of the representative of a garrison. gave audience, from the walls, to the military herald, and made his terms of capitulation, inch by inch; contracting, at the same time, for the preservation of the state, and the free exercise of the Judge, therefore, what surprise the Spa-Protestant religion. niards felt, when they entered the village, and found him alone in it. Yet the droll preserved the muscles of his countenance inflexible; and some weeks afterwards, when his wife lay in, he defired the great Gonfalve to be sponsor; which honour the pompous Castilian, for the jest's sake, could not decline, but, on the contrary, fent her some very handsome presents. This account, the historian (F. Spanheim, Mem. de Elect. Palatine) Ec4

fays, might appear to posterity a little romantic, if the notoriety of it had not been a circumstance indisputable at the time it happened.'

Another extraordinary military anecdote, relative to an event which happened towards the close of the last century, when

Marshal Catinat invaded Piedmont, is as follows:

Lt was of the highest importance to the King, then the Duke, to march in time for putting Turin in a better posture of defence. To this end he dispatched the Count de Santena, then a Major, and fince a General, with a few hundred men, to Avigliano, an old castle about three German miles from Turin, which commands the road and valley of Soufa. As the French army, which confisted of 30,000 men, was for passing by Santena, he fired at them with what little artillery he had. Catinat, who was no less surprised than provoked at this insult, sent to the castle, threatening to hang up the commanding officer: who returned for answer, he should never have him alive; and that till the artillery should be brought before the castle, no surrender was to be effected. Catinat, now still more incensed, ordered a battery to be erected, and summoned the castle a second time. Santena answered, that a breach must first be made; which being begun, he offered to capitulate. Catinat sent a lieutenant into the castle, to settle the articles of capitulation; but as a preliminary condition, demanded, that the foldiers should be made prisoners of war, and the officers hanged. Upon this Santena, taking the lieutenant into his chamber, thut the door, and conducted him between two barrels of gunpowder, with two lighted matches lying by. Santena taking one of the lighted matches, got upon one of the powder-barrels, and defired the Lieutenant to follow his example; adding, that fince he must die, many more of the French should take a spring into the air, before all the Piedmentese in the castle should lose their The Lieutenant so little relished this compliment, that he begged of Santena to lay aside such a desperate design, promissing to do all that lay in his power for obtaining an honourable capitulation for the garrison. Upon this affurance, the Commandant dismissed the Lieutenant; who having made his report to Catinat, the Marshal said, I must see this man of such extraordinary spirit and resolution; and allowed that he and his men should march out with their swords. As Santena passed by him, the Marshal said, that he did indeed well deserve to be hanged; but to shew him that he could esteem courage and bravery in an enemy, he should dine with him that day. table, some French officers upbraided Santena, on account of the Duke of Savoy's forming a league with heretics, against the Most Christian King. Santena remained silent for some time, till at last he asked the Marshal, whether he would allow him freedom of speech? Catinat consenting, he replied, that his master had indeed, for self-defence, taken up arms against the King of France, and had entered into alliance with heretics, such as the English and Dutch; nay, further, that his master was for doing something worse, and had sent to Constantinople, to negotiate a league with the Turks; but his Most Christian Majesty had been unluckily beforehand with him there. Catinat laughed at the officers who had forced this keen repartee from Santena, saying, this might teach them never to insult brave men under missortunes.'

In this pleasing manner Mr. Simes leads his readers through the most essential parts of tactics.—We have but one piece of advice to offer him, and that is, to cancel his title-page, &c. and call this the Second Volume of his Military Medley.

ART I.I. Eight Esays, or Discourses, &c. Translated from the Spanish of Feyjoo, by a Gentleman. 8vo. 5 s. Boards. Payne, Dilly, &c.

HIS Volume of Essays on historical subjects confirms us in the opinion we have already formed, and had frequent occasions to express, concerning the good sense and learning of this respectable Writer. A great variety of curious historical facts are here collected, with a view to illustrate and support the Author's ingenious observations on the subjects enumerated in the title.

The first Essay treats of the difficulties which attend the writing of history; contains examples of the principal saults in historical composition, taken from the most eminent authors; ancient and modern; and examines several historical incidents and events, which, in the opinion of the vulgar, pass for indisputable, in order to shew that they are either salse or doubtful.

The principal object of the second Essay, on the Divorce of History from Fable, is to prove that the ancient sables are not, as many have maintained, to be traced up to the events recorded in the sacred history.

In the Essay on Books of Instruction, with respect to politics, Feyjoo maintains, that books can be of little use in teaching the practical art of government; since the variety of coincident circumstances is so great, that the same combination can never be expected to occur in any new case in politics, which has already been described in history;—and that where policy has for its object the good of the community, the requisites are, a noble innate disposition, a clear understanding, and inflexible virtue; and where its end is power, cunning and hypocrify will be of

more avail than the most complete knowledge of the science of politics, as taught in books.

In the apology for, or vindication of, the characters of fome persons who have been famous in history, we find a great variety of judicious observations, concerning—the celebrated story of Empedocles casting himself into Mount Ætna—the true characters of Democritus and Heraclitus—the philosophy and conduct of Epicurus—the value of the writings of Pliny the Elder, and of Lucius Apuleius—and concerning the political and personal character of Tamerlane, particularly with reference to Bajazet.

In a Letter concerning the Writings of Lord Bacon, the Author endeavours to prove, that he was the first philosopher who brought into discredit the method of systematizing on the ground of conjecture, and who pointed out the track which philosophers ought to pursue in their researches into nature.

The concluding Letter, on the subject of The Wandering Jew, contains many curious particulars concerning the perfons who have appeared under that name, from the year 1229 to 1699, pretending to have been alive from the time of our Saviour: and affords one of the most striking proofs of the height of credulity to which the human mind, under the influence of superstition, and practised upon by the artisce of imposture, is capable of being carried.

On the whole, this volume abounds with judicious remarks on historical subjects, which will amply repay the labour of an attentive perusal.

\*\* Since writing the above Article, we have observed, in the public prints, an advertisement of the whole of this Gentleman's Translations from Feyjoo, in 4 vols. 8vo, containing 29 Discourses; price 1 l. 1 s. in boards. The Translator's name dands in the advertisement, viz. John Brett, Esq;

ART. IV. Joannis Brunonis, M. D. de Medicina Prælectoris, Societatis Regiæ Medicæ Edinensis Præsidis, Elementa Medicinæ.

12mo. 6 s. Boards. Edinb. 1780. Sold by Dilly in London.

AND who is Joannes Bruno? We have read of a Saint Bruno, the founder of the Carthusian Order; but we scarcely think our present acquaintance any way related to him. Bruno! We remember to have heard of a John Brown at the University of Edinburgh, a celebrated Latinist and Thesiswriter; and if we were sure that Bruno is good Latin for Brown, we should from several tokens conclude this to be the man. Whoever he be, let us see what he has to say to the Public.

He

He begins with telling us, that he has spent more than twenty years in learning, teaching, and diligently examining every part of medicine. That the first lustrum was passed in hearing, believing, and treasuring up; the second, in looking over, ordering, and surbishing his stores; the third, in doubting whether they were good for any thing, and deploring that he had spent so much time to little purpose. It was not till the fourth lucky period, that light began to dawn; at first, faint and obscure, "Quale sub luce maligna est iter in sylvis;" but now, we may presume, shining in sull meridian lustre, capable of illuminating, not only this savoured votary of Apollo, but the whole medical world.

We shall attempt to give our Readers some little glimpse of this new light; though, for want of perfect illumination in our-selves, we despair of communicating any great degree of it to others; and must refer those to the original source who wish for a more thorough irradiation.

The property, by which animated is distinguished from inanimate matter, of being put into action by external things, as heat, air, food, &c. is by this Author termed incitability, and the things themselves, inciting powers.

The effect produced by the action of inciting powers upon

incitability, he calls incitation.

In proportion as incitation has taken place, incitability is exhausted, and inciting powers lose their effect. On the contrary, the less incitation has been produced, the more incitability remains within, and inciting powers exert the greater effect.

There are two terminations of incitation; 1st, The exhaustion of incitability from too violent an action of the inciting powers, which brings on indirect debility; 2dly, Excess of incitability, from a deficiency of inciting powers, bringing on direct debility.

A due degree of incitation confers health; its excess, or deficiency, produces disease. There is no other state of the living body than what is comprised within these distinctions; and no other cause of disease.

The discases proceeding from too great incitation are the phlogistic; those from too little incitation, are the asthenic. The former, this Writer tells us, were tolerably understood, with respect to their cure, by Sydenham; the latter, by nebody.

So far we proceeded in the Author's system with some degree of clearness of conception; but on coming to the application of these principles, the excessive perplexity of the language (evidently owing to a studied elegance), and the want of precision in the fundamental ideas, soon involved us in such darkness, that we were obliged to lay aside the book, in despair. The Writer, as appears by the title-page, is also a lessurer. To those who have the advantage of hearing his doctrine in its en-

larged form, it may, doubtless, appear more intelligible; for our own parts, we confess we are not able to go along with him in this summary.

One thing it is obvious to remark from the flight view we have taken of this system. It is sounded on a fancied simplicity, whereby a shorter road to the acquisition of the healing art is supposed attainable. For by making only two classes of diseases, totally opposite in their natures, it would seem that we can never be at a loss to ascertain the class of the disease prefented to us, and the consequent method of treatment. it has been justly observed by the illustrious Baron Haller, that very fimple views of nature are scarcely ever just ones. Though the main springs of the animal machine may be few, were we capable of seeing them; yet as far as our limited faculties can penetrate, it is a machine extremely complicated in its structure, and various in its action: and when out of order, we must not venture to interfere in recifying it, without attention to a numerous train of circumstances, a neglect of any of which may overthrow the best laid plan of operation. That the art of medicine is tedious, and difficult of attainment, and uncertain in its efficacy, is as true now, as it was in the days of Hippocrates; and we apprehend will remain so, notwithstanding all attempts like the present to simplify it.

This work is a first volume, containing only the Morbi Phlogistici, divided into Phlegmasia, Hamorrhagia, Exanthemata phlogistica, and Apyrexia phlogistica.

ART. V. A Complete Physico-Medical and Chirurgical Treatise on the Human Ege: and a Demonstration of Natural Vision. The whole illustrated with a Variety of fine Engravings, &c. on a new Plan. By Peter Degravers, M. D. Professor of Anatomy and Physiology. Translated from the French. 410. 11. 15. Boards. Law, &c. 1780.

HE first thing that strikes the Reader, on opening this performance, is an Apology—and never was one more necessary—for the style of this translation; which, it seems, was executed by the Author, who declares himself 'too conscious of his desiciency, not to ask his Reader's pardon beforehand, and give him warning of the sact, before to trespass on his time.' He always intended, he adds, to translate it into English, 'and asterwards to have it revised by a person able to the task;' but found himself obliged to desist, 'having met with none who could keep to the sense, in reforming the style.' This apology will not be readily admitted by any English Reader; who cannot but perceive that the greater part of the numerous transgressions against the English idiom, which occur almost in every part of this work, might easily have been corrected even by a person

person unacquainted with the subject; not only without injury to the sense, but to the improvement and elucidation of it; especially under the inspection of the Author. Such expressions as those above quoted from the Apology, and others equally offending against idiom, might have been corrected by the most unlettered Englishman;—such as 'letting tunics macerate into the water:'—'performing a little hole' in a body:—'practissing a hole at a window shutter,' &c. &c. And though, in such passages, the Reader cannot be at a loss to understand the Author's meaning; it will easily be conceived, that there must be many others, in which, from the same cause, it will be rendered obscure, or absolutely unintelligible.

The Author commences his work with an anatomical description of the human eye, and the parts immediately connected This description is illustrated with several plates, with it. which appear to be very well executed; and is followed by observations on 'the nature and properties of light,' and on 'fimple and natural vision.' On this subject, he observes, that 'natural and simple vision is not yet known, or at least explained as it ought to be, and that no author has given any physical reasons concerning it.' In short, he finds fault with the systems of preceding philosophers and writers on optics; and frankly tells us, he rejects them all.' But his own observations, at least as they appear to us through the opaque medium of this translation. are such, that we cannot perceive that he has given us any thing better, or even to good, in their room. This part of the work is so very trisling, that the whole of it might with great propriety have been omitted; notwithstanding the plausible apparatus of diagrams and demonstrations.

The Author next proceeds to treat of the disorders of the eyes in general; and afterwards of the 'lacrymal ways,' and of the harmony which exists between the 'productive lacrymal ways, and the absorbent ones;' or, in other words, between the excretion of the tears from the glandula lacrymalis, and their absorption into the puncta lacrymalia. On this subject, he affirms, that though anatomists have in general maintained, that the immediate source of the tears came from the glandula lacrymalis; he is convinced that the excretory ducts of the cornea surnishmuch more of that sluid, than the gland to which they have exclusively attributed that faculty; and that the excretory ducts of the cartuncula lacrymalis, of the conjunctiva, and those of Meibomius's glands, surnish at least as many tears as the excretory ducts of the cornea: so that it is very casy to prove, that the glandula lacrymalis does not surnish one third of them.

The Author lays great stress on this observation; not merely as a matter of anatomical curiosity, but as it indicates the true cause of several diseases of the eye, originating from an in-

creased excretion in the parts above mentioned. Thus, to give only one instance; so large a quantity of tears may be furnished, in consequence of the morbid relaxation and preternatural dilatation of the excretory ducts of the cornea and conjunctiva, as to deceive a practitioner who is ignorant of this circumstance, and induce him to believe that there was an obstruction in the ductus ad nasum; which nevertheless might be in the most perfect state, though not capable of carrying off this unusual quan-

tity.

The Author next relates several experiments, the intention of which is, not only to prove the existence of these excretory ducts in the conjunctiva and cornea; but likewise to shew, that the liquor which passes through them is surnished by the aqueous bumour, which he accordingly considers as the most abundant source of the tears. He surther endeavours to prove, that the aqueous humour itself is produced, or regenerated, by a kind of transludation from the vitreous bumour; and produces experiments to shew, that this last body consists of a capsulary tunic, inclosing a cellular substance, the cells of which have a communication with each other, and are full of a diaphanous aqueous sluid, which is conveyed into each cell through a great number of lymphatic vessels, which pass from the shoroides and retina.

To shew the similarity of the aqueous and vitreous humours, chemically examined, the Author, after letting out the aqueous humour from the eye of a subject lately dead, places the globe, a little inclined, upon a small grate, which stands on a glass A diaphanous fluid, like the aqueous humour, will drop from it gradually; and in less than six hours the eye will On examining it, the tunics of the vitreous hubecome flat. mour will be found without fluid. On taking equal parts of this vitreous fluid, and of the aqueous humour, and evaporating them over a flow fire, in separate vessels, till they are reduced to one third; they will each be found to have acquired the same degree of viscosity as a weak solution of gum arabic; and some chrystals will be found in each, when cold. Continuing the process, each will produce an equal quantity of alcaline falt; which will be found to weigh about a tenth part of the quantity employed in the experiment.

According to an experiment of the Author's, the quantity of tears produced by each eye, in the space of twenty-four hours, is commonly two ounces and upwards. He applies close to the circumference of one of the eyes a small drinking-glass; where it is suffered to remain half an hour. 'A light vapour is soon perceived, which condenses into drops over the whole extent of the inside surface of the glass. These drops, we are told, amount to the weight of twenty or twenty-five grains. Being procured by perspiration, they contain nothing of a saline or

vilcous

viscous nature. This experiment is necessarily inaccurate, from the very nature of it; independent of any consideration of the quantity of tears absorbed, during the same time, by the puncta lacrymalia. The Author gives us a calculation on this last subject, which, we own, we do not understand.

After treating of the absorbent part of the lacrymal system, the Author gives us his formulæ medicamentorum; which we can by no means approve; as, in the greater part of them, the effective ingredients, when there are any in the Recipe, are overwhelmed by a rabble of non-effectives. Thus his resolving cataplasm consists of a medley of no less than fourteen seeds, meals, flowers, and roots. An ounce of purging falts is not prefcribed, without a little hoft of roots, leaves, and feeds, in its The Author, too, adopts the unintelligible jargon of the last century, when, in characterising a certain decaction of balm and betony, and two other equally unmeaning ingredients, and which—though no good reason can be given why—is yeleped Cephalic; he gravely tells us, that 'it fortifies the nerves, and refreshes the animal spirits.' Nor can we conceive, why he gives to a certain composition, consisting of waters, spirits, oils, and balfam, the strange title of Fluidus electri vim babens, and afterwards calls it an 'Electrical fluid.'

The last part of the work contains the Author's 'Curative Methods'—for the Fistula lacrymalis; for the disorders of the eye-lids; for the external and internal disorders of the globe of the eye; and for the complicated disorders of the eye, and its attributes. We shall not attend him through this part of his work. Those who particularly profess this branch of surgery, especially the operative part of it, may probably, when they have made themselves masters of the Author's phraseology, meet with some hints that will be useful to them. In consequence of his uncouth idiom, we have not been always certain that we have fully caught his meaning, even in those parts of his work which we have chosen as the subjects of the preceding analysis.

Before we take our leave of this performance, we cannot help animadverting on a passage, in which the Author, surely with too great considence, denies the efficacy ascribed to electricity, in certain diseases of the eyes, in two late publications. 'One,' he says, 'I would not have thought worth mentioning, had it not accounted for a gutta serona cured by positive electricity.'—
'To this I object, that a blindness may have been cured by electricity, as well as some other disorders; but that a gutta serona has, is one of the greatest absurdation, or a downright ignorance.'—We know not to what publication the Author alludes in this civil criticism: but in addition to Mr. Hey's and other successful and well authenticated cases that might be named, we shall only refer him the concluding part of the following Article:

Article; where little doubt can be entertained that the cure of an incipient gutta serena was effected by electricity: especially when it is considered, that sensation was restored to each eye, fingly, and fuccessively, on the successive application of that remedy, on two days immediately following each other.

Speaking of the second writer, he says,—' the other, a warm

promoter of medical electricity, would have equally commanded my filence, had it not pretended to ascertain many physical and smoral impossibilities.'— A fiftula lacrymalis is of such a nature as not to be removed by any shock whatever, when existing either in the lacrymal absorbent ways, or by a desect in these parts. I have, for the support of my affertions, the experiments lately made by M. Mauduyt, at the expence of the French govern-See his Extract for 82 patients electrified.

chez Philippe-Denys Pierres, Printer.'

We have not seen this Extract; but if we had, we should fill be at a loss to know how these, or any other experiments, could prove that a fiftula lacrymalis has not, or could not have, deen cured by electricity, under the administration of others. In apposition to this negative affertion of the Author, we have the positive testimony of a late writer to produce; to whom we suppose that he alludes. We mean Mr. Cavallo; an account of whose performance is given in the present number. His testimony is as follows:

"All the cases of fistula lacrymalis, as far as I am informed, that have been electrified by persons of ability, for a sufficient sime, have been intirely cured. The method generally practifed has been that of drawing the fluid, with a wooden point; and to take very small sparks from the part. The operation may be continued for about three or four minutes every day. It is remarkable that, in these cases, after curing the fiftula lacrymalis, no other disease was occasioned by it, as blindness, inflamma-

tions, &c. by suppressing that discharge."

We have attended to these criticisms of the Author, not merely to exhibit them as instances of false reasoning, but from a confideration much more important. Observations of this kind, thus decifively pronounced, cannot possibly do good to any one; but may prove injurious to many, by deterring either the members of the faculty, or the afflicted, from attempting to procure relief against a most deplorable disease, by making trial of a new remedy, even allowing it to be a doubtful one: whereas electrical trials undoubtedly may be attended with success, and on the other hand there is no danger of their proving injurious; especially when conducted in the mild and judicious manner in which electricity has for some time past been applied.

B...y.

ART. VI. Remarks on the Ophthalmy, Psocophthalmy, and Purulent Eye. With Methods of Cure confiderably different from those commonly used; and Cases annexed, in Proof of their Utility. By James Ware; Surgeon. 8vo. 2s. 6d. Dilly. 1780.

HIS little publication deserves the more particular notice, not only as it contains a judicious and well written account of the disorders mentioned in the title-page; but as it exhibits some new methods of cure, the efficacy of which appears to be satisfactorily ascertained, by various trials made of them by the Author, and by Mr. Wathen; to whom he acknowledges himself indebted for the practical improvements de-

scribed in this performance.

After giving a brief description of the eye and its appendages, the Author first treats of the opathalmy, or inflammation of the eyes; and after describing the nature and causes of that disorder, and pointing out the more general methods of cure, he proceeds to recommend a local application to the part, the use of which has been attended with remarkable success. This application is the Thebaja tindure of the London Dispensatory; composed of opium and warm aromatics, digested in mountain wine. We shall abridge the Author's account of the manner of using it, and of its effects.

Two or three drops of this timeture are applied to the naked eye, by dropping them from a vial, once or twice a day, according as the symptoms are more or less violent. A sharp paint is excited, followed by a copious flow of tears, which continue a few minutes, and gradually abate: after this, a great and remarkable degree of ease generally succeeds. The inflammation is often visibly abated by one application; 4 and many bad cases have been completely cured by it in less than a fortnight; after every other kind of remedy had been used for weeks, and sometimes months, without any success.'-In some cases, however, a longer use of it is requisite; and a sew instances have occurred. in which no relief at all was obtained from its first application. In such cases, the Author advises to suspend the use of it, till the excessive irritation has been diminished by evacuations and other proper means: after which, it may again be applied, with hopes of fucceis. The trial is faid to be attended with no other inconvenience than that of a pain, which does not continue long; and as foon as this goes off, the eye becomes perfectly easy, and the diameters of the blood vessels are visibly diminished.

It might be thought, that the curative intention, in this case, might be better answered by an aqueous solution of opium: but the Author, who has made several experiments to ascertain this point, has sound reason to confine himself, for a long-time past,

REV. Dec. 1780. F f

to the use of the tincture alone: and from repeated experience recommends it, with the helps and cautions given in this panaphlet, 'as a most effectual application in every species and stage of the disorder, from the most mild and recent, to the most obstinate and inveterate.'—Nine cases, selected out of a great number, are afterwards added, which seem satisfactorily to evince the efficacy of this remedy.

The new method proposed by the Author for the cure of the psorophthalms, or inflammation and ulceration of the edges of the eye lids, is the unguentum citrinum of the Edinburgh Dispensatory, applied to the parts, either with the singer or a small brush of camel's hair. The utility of this application is ex-

emplified by the relation of feveral cases.

For the cure of the disorder called the Purulent eye, to which new-born children are subject, the Author recommends the application of astringents; on a conviction that the discharge is not real pus, but only mucus, increased in quantity, and altered in colour, by some irritating cause. The remedy which he has found to be highly useful in this disorder is the aqua campborate of Bates's Dispensatory, greatly diluted with water, and injected with a syringe.

At the close of this performance, the Author relates a fingular case of a gutta serena, lately, and we may almost add, extem-

poraneously, cured by electricity.

The patient, Susannah Moody, about 17 years old, was feized with a pain in her teeth and jaw, on January 29, 1780, which after two days produced a confiderable swelling in the face. These symptoms, however, soon disappeared; but were fpeedily succeeded by an inability to open the eye-lids. An apothecary, who was consulted, was surprised to find, on opening the lids with his fingers, that the fight of both eyes was entirely loft. In this state the Author saw her, and found no inflammation in either eye; but the pupils of both were much enlarged, and the Iris had but a very small degree of contraction. The Thebaic tineture was applied, without effect; the was afterwards cupped on both temples, from which three ounces of blood were taken away; and then a bliftering plaifter was applied to each temple, and two others behind the ears. No visible change was produced by these means, either on the eye or eye-lids; for on separating the latter, the patient had not the least degree of fight in either eye. We shall give the remainder of this case in the Author's own words:

On February 7, with Mr. Wathen's consent, I electrified the left eye for a quarter of an hour: first by carrying a stream of the electric fire through the eye; and afterwards, by drawing sparks from all the parts which surrounded it. That evening the perceived no alteration; but the next morning she could open

the left eye-lids with eale, and distinguish clearly all the objects which surrounded her. The benefit did not, however, at all extend to the right eye or lids. I therefore electrified this eye, exactly in the same manner, and for the same length of time, as I had done the other. The consequence was, that, on the next day, the patient had so far the use of the right eye, as to be capable of distinguishing large objects; though not with the same clearness as the did with the left. That night the complained that her head felt very heavy. February oth, I passed a stream of the electric fire through both eyes, and drew sparks from them; which I also accompanied with the application of small shocks through the head in different directions. The application gave her more pain than it had done before; but succeeded in the happiest manner: for, on the following day, she opened both eyes with perfect ease, and saw very distinctly. I thought it unnecessary to electrify her again, or to do any thing more, than order an opening medicine; which entirely removed the heaviness she complained of in the head; and her sight was perfectly restored.'---If this disease was not cured by electricity, it must be owned, that the application of it, on two following days, was fingularly well timed.

ART. VII. An Effay on the Theory and Practice of Medical Electricity. By Tiberius Cavallo, F. R. S. evo. 3 s. 6 d. Printed for the Author. 1780.

THE good effects of electricity have been indisputably ascertained, from time to time, in various cases, which have, through different channels, been communicated to the Public; so that, though its powers may have been mistaken, or over-rated in particular inflances, no reasonable doubt can be entertained of its efficacy in many diforders; and particularly in the cure of some which had resisted all the regular or usual modes of relief. The application of this wonderful power to medicine, almost immediately followed the discovery of the Leyden vial; the altonishing effects of which on the human frame attracted the attention of all who were witnesses of them; and very naturally suggested the idea that the same agent, which could thus disorder the human body, as other medicines are wont to do, might, like them too, possess the powers of remedying its disorders. In proof of the justice of this remark, we may observe, that the Leyden vial was discovered in Holland in the year 1746; and one of the most celebrated cures of the palfy, produced by electricity, was effected by M. Jallabert at Geneva, towards the end of the year 1747 .

See Dr. Priefley's History of Elettricity, pag. 403, 1st edition.

The printipal intention of the present performance is, to autimounce the improvements that have lately been made, in the administration of this new and fingular medicine. The Author is advantageously known to the world, with respect to his skill in electricity, by a useful treatise which he formerly published on that subject; are account of which was given in our

97th volume, November 1777, pag. 362.

The principal improvements, respecting medical electricity, here recommended, consist in abstaining from the administration of strong shocks; and the employing in their room either the electrical stream, issuing from a metal or a wooden point, small or strong sparks, or small shocks; according to the nature of the disorder, and the sensibility of the patient. The improvements in the machinery chiefly consist in the use of certain insulated directors; by means of which the electric matter is conveyed to any particular part of the body, either in the form of a stream, or sparks, or shocks.

It might very naturally be suspected, that the electric arra, at stream, proceeding from a metal or even wooden point, could scarce be possessed of any considerable essicacy: but the Author assume that, to his certain knowledge, adduced from the practice of persons who have had long experience in this subject, this method of electrization has often mitigated pains, and cured obstinate and dangerous diseases; which could not be removed

by any other remedy that was tried."

He afterwards observes, that even the stream issuing from a wooden point, which is stronger than that which proceeds from one of metal, may be directed towards the naked eyes of the patient, without any apprehension of hurting him. In this and other delicate cases, however, care must be taken, especially if the machine should be powerful, that the wooden point be not too obtuse, split, or otherwise injured: less a strong and pungent spark be excited, which might prove highly injurious to the part which it strikes.

After describing and delineating some of these new members of the medico-electrical apparatus, and giving proper directions and cautions with respect to their use; the Author enumerates, or briefly describes, those disorders to the removal of which electricity has been principally applied, in its vasious forms;

giving a short account of its success.

ĺ.

Rheumatic disorders, even of long flunding, have been relieved, and generally quite cured; either by using the woodens point, or drawing sparks through stance from the part, for about four or five minutes, once or twice a day. Despues, the tooth-ach, when the body of the tooth is not affected, and swellings, in general, which do not contain matter, have been esten relieved or cured. Inflammaticus, particularly of the

cla.

eyes, are distincted by a gentle electrization. The gutta serves has been often cured; though electricity, has frequently proved ineffectual in other cases, notwithstanding it was administered for a long time, and with all possible attention. One case of an opacity in the virreous humour was some time ago perfectly cured by electrization. We have in a preceding Article men-

tioned its efficacy in the fiftula lacrymalis.

Palfies, of long standing, though generally relieved, by employing the wooden point, or drawing sparks through stannel, are seldom persectly cured: though various cases of St. Vitus dance have been cured. In this disease, shocks of about one-tenth of an inch, sent through the body in various directions, are recommended. To enable the Reader to judge of the strength of these shocks, it will be sufficient to observe, that they are supposed to be produced from a coated surface of about 73 square inches.

The science is said to have been often cured; and incipient sprophulous and other tumours to have been dispersed, by electricity. In cancers, the pains have been alleviated by the use of a metal point; while that of a wooden point aggravated them. In one case of a most confirmed cancer, of long standing, the breast has been considerably reduced in size. By the use of the points, nervous bead-achs, even of long continuance, have ge-

nerally been cured.

Without qualtioning the sufficiency or veracity of the testimony on which the Author grounds the preceding as well as other observations, which we omit; we cannot help wishing that he had specified the authorities, or named the sources, from which some of the foregoing conclusions have been drawn, as

well as the two following fingular observations.

'The gout, extraordinary as it may appear, has certainly bleen cuted by means of electricity, in various inftances. The pain has been generally mitigated, and fometimes the disease has been removed so well as not to return again. In those cases, the electric shid has been thrown by means of a wooden point, although sometimes, when the pain was too great, a metal point only has been used.'

Agus very seldom fail of being cured by electricity, so that sometimes one electrication, or two, have been sufficient. The most effectual and sure method has been that of drawing spanks, through slannel, or the clothes, for about ten minutes, or a quarter of an hour; —either at the time of the fit, or a

Mort while before it is expected.

We have lately [See M. R. April 1780, pag. 308] had occasion to speak of the efficacy of electricity in semale obstructions. The present Author affirms, that they are successfully and speedily cured by means of electricity, even when the differ f f 2

ease is of long standing; and after that the most powerful medicines used for them have proved inessectual. The cases of this sort, in which electrization has proved useles, are so few, and the successful ones so numerous, that the application of electricity for this disease may be justly considered as an essicacious and certain remedy.

With respect to the mode of applying this remedy, concerning which we expressed some curiosity, in the article above referred to; Mr. Cavallo says, that 's small shocks, i. e. of about one-twentieth of an inch, may be sent through the pelvis; sparks may be taken through the clothes from the parts adjacent to the seat of the disease; and also the electric shuid may be transmitted by applying the metallic or wooden extremities of two directors to the hips, in contact with the clothes; part of which may be removed in case they are too thick.—The number of shocks may be about twelve or sourcen. The other applications may be continued for two or three minutes,' daily. 'But either strong shocks, or a stronger application of electricity than the patient can conveniently bear, should be carefully avoided: for by these means, sometimes more than a sufficient discharge is occasioned, which is not easily cured.'

The Author next presents us with some authentic physical cases, in which electricity was administered. The greater part of these have been formerly published. We shall only give an abstract of the first, communicated to him by Mr. Parting-

ton, which appears to be original.

The disorder was a violent inflammation of the eyes, attended with an inability of opening the eye-lids. When they were forced open, the coats of the eye appeared of a uniform red colour. The patient could not, with the right eye, distinguish any objects in a room; the whole of which appeared equally dark. When the eye was directed to the window, he could only perceive a red glare of light, like a wall. The left eye was not in so bad a state. The disorder was accompanied with excruciating pains darting to the back part of his head, or to the centre of his eyes. The complaint had continued two months, and had resisted all the usual means of relief, administed by Mr. Ford, the Surgeon of the Westminster Dispensary; who then recommended the patient to Mr. Partington.

The first instrument used in this case was one invented by the late Mr. Ferguson. The electric stud was thrown upon the eye from the point of a brass wire, which passed through a cork fixed into the smaller end of a conical or funnel-like glass; while the larger end of the glass was fixed upon the eye: the point reaching within about half an inch of it. Sparks, however, attended with extreme pain, being sometimes produced from the point; Mr. Partington greatly improved the apparatus,

and removed that inconvenience, by fixing a wooden point upon the metal wire.—[The directors described in this treatise are mentioned as an ulterior improvement.]

After Mr. Partington had electrified the patient's eyes three days in this manner; 'the inflammation began visibly to abate; and in a fortnight's time it was quite subsided: but the pupil of the eye was so nearly closed, that scarce any of it could be seen. He continued to be electrified every day for five weeks, and the pupil gradually dilated, till he attained a degree of sight sufficient to distinguish objects on the other side of the way. The pains had now intirely left him, so that he omitted the use of electricity, and did not experience any farther inconvenience after it.'

In an Appendix, the Author has added a few experiments, in which certain appearances occur, analogous to some effects produced by electricity upon the human body. The greater part of them are well known to those who are conversant in electricity,

ART. VIII. Canadian Freebolder, Vol. III. CONCLUDED. See our laft.

UR Author makes a variety of observations, tending to shew the dangerous consequences of all forcible attempts to establish Episcopacy among the Americans. But he admits, that if it should ever happen that the body of the people in the colonies of Virginia, Maryland, and South Carolina (in which the church of England is established), should earnestly desire to have a bishop resident amongst them, and should testify that desire in a regular and constitutional manner, by a petition of their affembly to the King to establish one amongst them; in such a case, the request ought to be complied with. But the American Assemblies have been so far from being disposed to make any fuch request, that, on the contrary, the Assembly of the province of Virginia returned thanks to an Episcopal clergyman of the name of Henley, for having refused to join with fome of his clerical brethren in petitioning for a bishop; as having, by the faid refusal, rendered a good service to the province, by preventing the further profecution of a measure which they thought would have a pernicious tendency.

He takes notice, that it is only resident and permanent bishops the Americans are jealous of; and says, the method of supplying the want of a resident Bishop in America by successive visitations of the Bishops of England and Ireland, seems to me to be the very best method that can be taken for the purpose: insomuch that I should be glad to see an act of parliament passed, that should in some measure impose such a visitation of America upon them as a kind of duty, by making the performance of it a necessary qualification to a translation to a better bishopric: after which, I have no doubt, there would al-

ways be a sufficient number of the junior, or inferior, Bisheps, who

would be very willing to undertake the voyage.

Such a peregrination into a diffant country, for the fake of communicating the benefits that refut from the Episcopal office to their brethren in America, would reflect honour on the Bishops who should undertake it; and their conduct would then be thought to bear fome resemblance to the character of neal and diligence and philanehropy by which the Apostles were distinguished; who travelled about from country to country with indefatigable industry, over all the Roman empire, to plant and propagate the religion of their blessed Master.

He gives an account, as an evidence of the wrong-headed zeal of some of the Episcopalian party in America, of a severe prosecution which was carried on against Mr. Francis Mackemie, a very worthy Presbyterian minister in the province of New York. under the government of Lord Cornbury. 'This profecution was in the year 1707. The inhabitants of the city of New York confished, at that time, of Dutch Calvinists, upon the plan of the church of Holland; French refugees, upon the Geneva model; a few English Episcopalians; and a still smaller number of English and Irish Presbyggrians, who, having neither a minister nor a cherch, pred to assemble themselves every Sunday at a private house for the worship of God. Such were their circumstances, when Francis Mac-Kemie and John Hampton, two Presbyterian ministers, arrived at New York in January, 1707. As foon as Lord Cornbury (who hated the whole persuasion) heard that the Dutch had consented so Mac-Kemie's preaching in their church, he fent to forbid it: in confequence of which prohibition, the public worthip of the Presbyterians at New York, on the following Sunday, was performed with open doors, at a private house. Mr. Hampton preached on the same day at the Presbyterian church in the village of New-Town, at the distance of a sew miles from New York. This was considered by Lord Combury as a great offence, and a fit subject for a profecution; and he thereupon iffued a warrant to the therit of the county (whose name was Cardwell) to apprehend them and bring them before him, to answer for their misconduct in having preached without his lordship's They were accordingly apprehended by the faid therist at the said village of New-Town two or three days after this pretended offence, and were led, as it were in triumph, by a round-about way of several miles, through a place called Jamaica in Long Island, to They there appeared before Lord Cornbury, who be-em with much roughness and ill manners. They were New York. haved to them with much roughuess and ill-manners. not, however, daunted by this treatment, but defended themfelves They grounded their defence upon the Engwith a decent firmness. lish act of toleration, passed in the first year of King William's reign, which they supposed to extend to the American colonies, as well as the penal statutes of Charles the Second's reign, against which it afforded a protection: and they offered to produce testimonials of their having complied with the conditions of the said Act of Toleration in the provinces of Virginia and Maryland, and promised to certify the house in which Mr. MacKemie had preached, to the next quarter selfions of the justices of peace at New York, as the house in which they intended to officiate to the Presbyterians of New York as a meetingboufe boufe for the purpose of divine worthip, agreeably to the directions of the said Ast of Toleranion.'

Under an fillegal warrant of commitment, the two miniflers continued in prison for the space of six weeks and four days, by reason of the absence of Mr. Mompesson, the chief justice of the province, who was all that time in New Jersey. But, upon his return to New York, they applied to him for writs of babeas corpus, that they might be brought before him, and have the cause of their imprisonment inquired into, and determined upon according to law. They were accordingly brought before him apon such writs, and would have been discharged by him from their confinement, on account of the illegality of the warrant by which they had been imprisoned (the chief justice being, as Mr. Smith says, a man of learning in his profestion), if Lord Cornbury had not, on the very morning of the day on which they were to be carried before the chief justice, issued another warrant for their detention, which was drawn up in better form then the former. But here his Lordship changed the grounds of his accufation against them, and adopted the doctrine he had before rejected, to wit, that the penal acts of parliament passed in King Charles the Second's time against Protestant Dissenters extended to the American colonies. He accordingly flated in the warrant he now iffued for their detention, " that they had been guilty of preaching in a Dif-Senting meeting-house, without having been qualified to do so in the manner directed by the Toleration-act." Upon this warrant they were compelled to give bail for their appearance at the next supreme court of the province, to answer such indictments as should be prefented against them for the Lid offence. The court fat a few days after; and then (great pains having been taken to secure a grand jury that should be inclined to favour the profecution), bills of indictment were preferred against them for this offence; and the grand jury found that against Mr. MacKemie, but threw out that against Mr. Hampton, no evidence having been offered to them in support of it. And Mr. Hampton was thereupon discharged.

The indictment being found against Mr. MacKemie, the trial of it was postponed till the following session of the court, which was to be in the month of June of the same year, 1707. It came on accordingly on the 6th of that month; and, as it was a cause of great expectation, a numerous audience attended it. Mr. Roger Mompes. fon fat on the bench as chief justice, and Mr. Robert Milward and Mr. Thomas Wenham were the affishant judges. Mr. Bickley, the Queen's attorney-general for that province, managed the profecution in the name of the Queen; and three advocates, whole names were Reignere, Nicoll, and Jamison, appeared at the bar as The indicament stated, That Francis counsel for the defendant. MacKemie, pretending himself to be a Protestant diffenting minifter, and contemning and endeavouring to subvert the Queen's ecclefiastical supremacy, unlawfully preached without the Governor's licence first obtained, in derogation of the royal authority and prerogative:-That he used other rites and ceremonies than those contained in the Book of Common Prayer: - And that, being unqualified by law to preach, he nevertheless did preach at an illegal conventicle. And both these last charges were laid to be contrary to the form of the English statutes made and provided in those cases. For Bickley, the Attorney-general, was, at the time of preparing that indictment, come to think that the penal laws of England against Protestant Dissenters did extend to the American plantations, though at the first debating of the subject, when the two ministers were first brought before the Governor, he had maintained the contrary opinion. And now, at the trial of the indictment, he endeavoured to prove the Queen's ecclesiastical supremacy in the Colonies; and that the said supremacy was delegated to her noble cousin, the Lord Corabary, with his office of Governor of the province; and confequently that his lordship's instructions relating to church matters had the force of This was his first ground of argument. And, in the second place, he contended, that the statute of Uniformity passed in King Charles the Second's time, and the penal laws passed against Protestant Dissenters in the same reign, were of force in the American plantations. And upon these premisses he concluded, that the jury ought to bring in a verdict against the defendant. On the other fide, it was infifted by Mr. Reignere, Mr. Nicoll, and Mr. Jamison (the defendant's counsel), that preaching was no crime by the common law of England; - That the statutes of Uniformity and the penal laws of Charles the Second's time against Protestant Dissenters, and the Act of Toleration, did not extend to the Province of New York; -- and that the Governor's instructions were no laws. And Mr. MacKemie himself (as Mr. Smith informs us) concluded the whole desence in a speech which sets his capacity in a very advantageous light. jury were satisfied with the reasons alleged in the desence, and, without any difficulty, brought in a verdict of Not guilty, no: with anding the exhortations of the chief justice to bring in a special verdict. Mr. MacKemie ought upon this to have been fet at liberty; but the judges were so shamefully partial against him, that they would not discharge him from his recognizance till they had illegally extorted from him all the money expended in carrying on the profecution against him, which, together with his own expences in defending himself, amounted to eighty-three pounds, seven shillings, and fix-pence.

'This last piece of oppression upon Mr. MacKemie gave occasion to a resolution of a committee of grievances in the new Assembly of New York, which met in August, 1708, which is expressed in these words: "Resolved, That the compelling any man, upon trial by a jury or otherwise, to pay any sees for his prosecution, or any thing whatsoever except the sees of the officers whom he employs for his necessary defence, is a great grievance, and contrary to justice."

Lord Cornbury, soon after this prosecution, became universally odious to the people, both in the province of New York, and the adjoining province of New Jersey, of which he was also Governor. And a variety of complaints were made against his government by the Assemblies of both provinces, he having abused his power, and oppressed the people entrusted to his care, in thany other instances besides the above malicious prosecution, and (amongst other things) having embezzled a sum of the public money in the province of New York. These complaints were not without effect; for Queen Anne (the his lordship was her first cousin) thought sit, in consequence of them, to remove him, in the following year 1708, from the government of both those provinces.

provinces, and to appoint Lord Lovelsce to succeed him; accompanying this mark of her just displeasure with a public declaration, 44 that she would not countenance her nearest relations in oppressing

her people."

This transaction, and some others related in this work, lead the Author to a variety of observations on the subject of toleration, which appear to be just and liberal. And if the same spirit of equity and moderation, respecting the government of the colonies, had been adopted which he has recommended, both in civil and religious matters, it would probably have prevented that fatal war with America in which we are now engaged, and which will ever be lamented by every fincere friend to the interests of Great Britain.

Our Author has also made some remarks on the subject of martial law; and is of opinion, that 'martial law relates only to the government of an army, or militia, and not to the people at large; and that it can be lawfully established, by the King's Tingle authority, only in times of actual invasion and rebellion, when recourse cannot be had to the King's courts of justice, and not in times of common war, when there is no fuch invafion or rebellion, nor even in cases of imminent danger of an invasion or rebellion. He has also made some severe strictures on a sermon preached by Dr. Markham, Archbishop of York, before the Society for propagating the Gospel in foreign Parts, on the 21st of February 1777; and an enquiry into the nature of the ecclesiastical supremacy of the Kings of England, or the powers belonging to them as supreme heads of the church of England. But for these, and other particulars, we must refer to the work itself.

ART. IX. Essays on the History of Mankind in rude and Mentionated Ages. By James Dunbar, LL. D. Professor of Philosophy in the King's College and University of Aberdeen. 8.0. 5 s. Boards. Cadell. 1780.

N a short Preface to these very ingenious Essays, the Author see Val. acquaints his Readers, that the design of his work isto folve some appearances in civil life, and, by an appeal to the annals of mankind, to vindicate the character of the species from vulgar prejudices, and those of philosophic theory. He further tells us, that the contents of his work are digested on a regular plan, though he has preferred the loofer form of Essays to a more systematic arrangement.

Such of our Readers as have taken an enlarged and comprehenfive view of human nature; marked the gradual opening and expansion of the human faculties; contemplated the species more than the individual; considered the earliest forms of civil life, and traced man from the first dawn of reason, the first rude

efforts towards civilization, through the successive stages of improvement, till he reaches the higher degrees of refinement in arts and policy;—such readers, and such only, will receive both entertainment and instruction from our Author's Essays. They plainly shew an extensive acquaintance with ancient and modern history, and bear evident marks of good taste and sound judgment. The subjects of his Essays have indeed been frequently discussed, and by writers, too, of the most distinguished abilities; but they are far from being exhausted, or incapable of surther elucidation. Our Author treats them like one who thinks for himself, who neither adopts nor supports any particular system; and though most of his observations are to be most with in other writers, they are placed in so clear and distinct a point of view, and often so happily illustrated, that they seem to acquire new force, and have an air of originality.

The primeval Form of Society is the subject of his sirst Essy; and here he shews, that society does not derive its origin from mutual dependence and mutual wants; but that it is the free and legitimate offspring of the human heart; that a certain delight in their kind, congenial with all natures, constitutes the fundamental principle of affociation and harmony throughout the whole circle of being. He concludes the Essy with some observations on a late publication, much read and admired in the fashionable world, but more dangerous than any specula-

tive theory to the morals of the riling generation.

As patrons of licentiousness, says he, Epicurus and Hobber, and even Machiavel and Mandeville, must bow to the noble author.

It is in the spirit of his performance to separate the sometime from the separate of life; to insult whatever is venerable in domestic alliquit whatever is venerable in domestic alliquite; to substitute artificial manners in the room of the natural; to sais superficial above solid accomplishment; and to hold up difficultation and imposture as the essentials of character.

This is a species of refinement avowed in no former age. It contains a solecism in education, and in the occonomy of civil affairs.

To exalt the Graces above Virtue, is, if I may say so, to exalt researches above their Creator. The Graces are chiefly amistile as emblons of Virtue. Break this alliance, and they are no more. Unite them with the opposite character, and this fantastical conjunction readers a monther still more deformed. For my own part, I had as feen behold the monther still in all the horrors of its native deformity, as in such insolent attire.

The Graces are the handmaids of Virtue, not the fovereigns; and all their honours are derived. But Virtue, though naked and analy-

orned, were Virtue still.

· Quam ardentes amores non excitaret sui, fi videretur!

'How different was the conduct of a Roman statesman, when, is the person of a sather, he delivered instructions to youth! The infiructions of the Roman fill the young with rapture. Those of the Briton excite indignation in the aged. But I ask pardon of the reader,

when I name the British author in the same breath with Cicero. And if the system of the noble lord was designed energy for the courtier, with the courtier let it rest. Without the formality of system, the strict observance of moral rules is dispensed with in the negociations of courts.

Let it be numbered then among courtly privileges to patronize deceit. When perfidy and diffimulation are declared by patent to belong to the members of the diplomatic body, they will become, per-

haps, more emphatically, the representatives of Kings.

But while things are thus adjusted to the meridian of course; while the civil code, in many countries, is no more than the breath of Kings; and in all countries, may be dissolved by legislative power; the meral code, which is paramount to all civil authority, and from which all civil obligations arise, remains eternally in force.

It was delivered from heaven to the people, and to maintain its

authority is the jus divinum of nations.

With these seatiments I close the Essay: and such sentiments and addressed more particularly to the British youth by one of their public guardians, who then only seels the sull importance of his station when

he animates the riling generation in the pursuits of honour.

These observations of our Author, though but little connected with the subject of the Essay, cannot sail of being approved by every good citizen, by every friend of virtue; they
come with great propriety from the pen of a professor of philosophy; and we hope that all the public and private instructors
of youth will, in the most earnest and affectionate manner, endeavour to impress their minds with such sentiments.

In his second Essay, the Doctor treats of Language, as an universal accomplishment. He introduces it with observing that, in tracing the origin of arts and sciences, it is not uncommon to ascribe to the genius of a sew superior minds, what arises necessarily out of the system of man; that though these are inventions which originate with one only, or with a sew authors, yet there are others which necessarily refer themselves to the multitude; and that the casual exertions of the former ought not to be consounded with the infallible attainments of the species.

Under this precaution he introduces the question concerning language, and proceeds to enquire, whether it be derived to us at first from the happy invention of a sew, or to be regarded as an original accomplishment and investiture of nature, or to be attributed to some succeeding effort of the human mind.

The supposed transition of the species, from silence to the free exercise of speech, says he, were a transition indeed aftonishing, and might well seem disproportioned to our intellectual abilities. Neither history nor philosophy are desistive upon this point; and religion, with poculiar wisdom, refers the attainment to a divine original. Suitable to this idea, language may be accounted in part nanual, in part artificial: in one view it is the work of Providence, in another it is the work of man. And this dispensation of things is exactly conformable to the whole analogy of the divine government. With respect

spect to the organs of speech, what is there peculiar to boast? The fame external apparatus is common to us and to other animals. In both the workmanship is the same. In both are displayed the same mechanical laws. And in order to confer on them similar endowments of speech, nothing more seems necessary than the enlargement of their ideas, without any alteration of anatomical texture. In like manner, to divest, or to abridge mankind of these endowments, seems to imply only the degradation of the mental faculties, without any variation of external form.

It is not then supposed that the organs of man alone are capable of forming speech. The voice of some animals is louder, and the voice of other animals is more melodious than his. Nor is the human ear alone susceptible of such impressions. Animals are often conscious of the import, and even recognize the harmony of sound. Thus far there subsists a near equality. Visible signs are likewise possessed in common; and language, in every species, is the power of main-

taining focial intercourse among creatures of the same order.

By the same medium man is able to converse, in some sort, with the brute creation; and there the various tribes with each other. But besides some general signs constituted to preserve harmony and correspondence among connected systems, there are others of a more mysterious kind, destined for the use and accommodation of each particular class. In this science the sagacity of the philosopher has hither-to made no discoveries. The mystery of animal correspondence will, probably, be always hid; and it is often no more possible to descend into the recesses of their intercourse, than to open a communication with a higher system.

In the great scale of life, the intelligence of some beings soars, perhaps, as high above man as the objects of his understanding soar ahove animal life. Let us then imagine a man, in some other planet,

to refide among a people of this exalted character.

Instructed in the sounds of their language, as the more docile animals are instructed to articulate ours, he might articulate too, but could acquire no more. He might admire the magnificence of sounds louder or more melodious than he had heard before. But by reason of a dissimilarity and disproportion of ideas, these sounds could never conduct him to the sense; and the secrets of such a people would be as safe in his ears, as ours in the ears of any of our domestic animals.

For the same reasons, if one of superior race were to drop into our world, our language might be, in some respects, impenetrable even to his understanding, because destitute perhaps of some percep-

tions essential to our meaner system.

Thus each order possesses something peculiar, which is denied to every other; and it belongs to the Author of the universe alone to exhaust that immensity of knowledge which he has diffused in various kind and proportion through the whole circle of being.

Here is an arrangement of providence coeval with the birth of things; and confidering the fimilarity of organical texture, the tact-turnity of the other animals is a problem to be accounted for, as well

as the lequacity of man.

Whence comes it that be alone fo far extends the original grant as almost to consider it as his peculiar and exclusive privilege? Because as almost to consider it as his peculiar and exclusive privilege?

tween the lower classes and him there subsits one important distinction. They are formed stationary; he progressive. Had the exact measure of his ideas, as of theirs, been at first assigned, his language must have stood for ever as fixed and immutable as theirs. But time and mutual intercourse presenting new ideas, and the scenes of life perpetually varying, the expression of language must vary in the same proportion; and in order to trace out its original, we must go back to the ruder ages, and, beginning with the early dawn, follow the gradual illuminations of the human mind.'

This subject is extremely curious, and it would give us pleafure to lay before our Readers the whole of what our Author advances upon it; but the limits necessarily assigned to this Article will not admit of it. He points out the steps which lead to the more regular combinations of sound, shews in what manner the analogical and discriminating saculties operate, and the various ways in which language is enriched, and diversified in its words,

in its texture, and in its idiom.

' In most speculations upon this subject, says he, there reigns a fundamental error. It consists in referring the rise of ideas and the invention of language to a different zera, as if a time had ever been when mankind laboured for utterance, yet fought in vain to open intellectual treasures, and to be exonerated from the load of their own conceptions. Under this impression we are apt to imagine some great projectors in an early age, balancing a regular plan for the conveyance of sentiment, and the establishment of general intercourse. In fuch circumitances, indeed, they must have resolved in imagination all the subtleties of logic, and entered far into the science of grammar, before its objects had any existence. Profound abstraction and generalization must have been constantly exercised; all the relations of thought canvassed with care, compared with accuracy, and arranged with propriety, and with order: a design competent, perhaps, to superior beings, but by no means compatible with the limited capacity of the human mind. Now these difficulties and incumbrances, in a great measure, disappear, by contemplating ideas and language as uniformly in close conjunction; and the changes in the former, and the innovations in the latter, of the same chronological date.

A few ideas, in the ruder ages, are subjected to expression with the same facility, as a greater number in succeeding periods. And hence speech, in all its different parts, is already formed when the vocabulary is exceeding scanty, and there is no variety or abundance

in any one class.'

Having considered speech in its lower forms, our Author proceeds, in his third Essay, to enquire into those superior marks of refinement and art which constitute the criterion of a polished tongue. But the extracts we have already presented to our readers are, we hope, sufficient to give such of them as are competent judges of works of this kind, an idea of the entertainment they may expect from Dr. Dunbar's performance. We shall close this Article, therefore, with the bare mention of the subjects of the remaining Essays, which are, — The Criterion of civilized

civilized Manners—The Rank of Nations, and the Revolutione of Fortune—The general Influence of Climate, and the Tendency of local Circumftances to affect the Character and Conduct of Nations—The Relation of Man to the furrounding Elements—Man confidered as the Arbiter of his own Fortune—Fashions that predominate among various Tribes of Mankind—The Tendency of moral Character to diversify the human Form—And the hereditary Genius of Nations.

Most of the Essays are followed by Notes, illustrating particular passages, and throwing additional light on the subject of the Essay to which they are annexed:

ART. X. An Attempt to aftertain and illustrate the Authority. Nature, and Design of the Institution of Christ commonly called the Communication and the Lord's Support. By Wilkiam Bell, D.D. Prebendary of St. Peter's. Westmiritter, Domestic Chaplain to her Royal Highness Princess Amelia. 8vo. 3 s. Boards. Robson, &c. 1780.

HE obscurity and absurdity in which the subject of this publication has been involved in the subject of this publication has been involved, is a striking instance of that fondness for mystery which is to be observed in the generality of mankind, and of the advantage which artful and interested men have taken of this prevailing foible. The doctrine of tranfubstantiation seems to be the utmost possible extent and degree of prieftly imposition and delusion. And in proportion as we depart from the plain and simple account of the Lord's Supper, contained in the Gospels, and defended and illustrated by Bishop Hoadly and the Author of this Treatise, we depart from the principles of common fense and rational piety, and expose ourselves to all the follies and extravagancies of superstition and enthusiasm. It might, indeed, have been imagined, that Bishop Hoadly's Plain Account had rendered any other formal discussion of the subject needless. But we believe that no one who reads the present Treatise, without prejudice, will think it superfluous, or wish that it had not been written. And the friends of Bishop Hoadly in particular cannot but be pleased with a publication, in which his Lordship's general scheme is so well supported, the objections made to some of his arguments so effectually obviated, and a few incidental mistakes so judiciously corrected. The account which Dr. Bell has given in his Preface, of the occasion and design of his work is as follows:

The following Treatife, which took its rife from the Author's endeavours, several years ago, to settle his own notions upon the subject, is an attempt to reduce the points in question relating to this rite, as near as may be, to demonstration, by examining into the only sources of information from which any true knowledge of it can be authentically deduced; the history of its institution given us by the Apostles, and whatever else is said of it in the New Testament itself.

On reviewing the argument with the closest attention, he has not been able to detect any fallacy, either in the principles assumed, of the consequences drawn from them. But as it is very far from impossible that he may have been deceived by some involuntary prejudice in favour of his own conceptions, he now at length submits them to the public; that from the unbiassed judgment of others he may either derive the satisfaction of being confirmed in the truth of his deductions, or the benefit of having his miltakes clearly pointed out, and such conclusions as may prove unexceptionable established. And with the direct view of more easily obtaining one or other of these advantages, the enquiry has been pursued through a feries of distinctathough connected propositions, drawn up in a close argumentative form; in order that every single principle upon which it proceeds may plainly and fully appear, and the truth or salsehood of every decountered on the control of the control

For the fundamental principles here enforced, with respect to the nature and effects of the inftitution concerned, the world has long been indebted to the well-known Mr. John Hales of Eton; and for a professed argument in their support, to a very eminent prelate several years fince deceased. But how clearly soever they have been established by this distinguished writer, in consequence of objections which have been urged against some particulars of his reasoning in their defence, the subject itself still remains involved in obscurity; and not only the public doctrines of each diftinet Protestant persuasion, but the private opinions of individuals of perhaps every persuafion, either vary confiderably from each other, or at least continue vague and indecitive. This obscurity and want of decision, therefore, it is the professed object of the following treatise to remove, by such an application of the only principles upon which the points in queftion are capable of being determined, and so clear a deduction of the material consequences resulting from them, as may evince the true nature of the rise by a complete direct proof; and without expressly adverting to objections, in effect meet and inperfede them.' were

We fear, that notwithstanding the rational principles advanced in this publication, and the just conclusions drawn from them, both the public doctrines of different Protestant communities, and the private opinions of individuals, will continue to vary from each other, and will fill be vague and indecifive. But every attempt to remove the absurd and superstitious notions which are entertained even by Protestants, of this plain institution, and to establish just and accurate ideas of it, deserves commendation: and it may with reason be expected, that so candid and judicious a treatise as the present will have some good effect in recalling the attention of individuals of every persuation to the subject, and engaging them to review their principles, to reject the additions and inventions of weak or defigning men, and to content themselves with those easy and rational notions of the Lord's Supper, that may be gathered from the original accounts which the Evangelists and Apostles have given of it. .

The treatife before us is divided into fections, without titles, through which runs a continued feries of propositions, ex
Rev. Dec. 1780.

G g preffive

pressive of the principles upon which the Author's scheme is founded, and of the conclusions, respecting the Lord's Supper, that refult from them. At the end of the treatife is an appendix, confishing of six differentions on different points relative to the general subject, and tending to obviate some objections which might be offered, and to support and illustrate the principles and reasonings contained in the treatise itself. To the whole are subjoined notes on particular passages, both in the treatise and in the appendix. We shall give our Readers some extracts from each, that they may be able to form a judgment both of the general scheme of the work, and of the manner in which it is executed. The treatife, as we have observed, confifts of a feries of propositions regularly numbered, from which we felect the following:

II. The true design of every religious rite must depend entirely

ppon the intention of the institutor himself with regard to it.

III. The intention of the inflitutor of any religious rite, and confequently the nature and design of the rite itself, must be learnt from the declarations of the inflitutor, confidered jointly with all fuch circumstances as he must be supposed to have regarded at the time of the inflitution; and from the declarations of fuch other persons, if any fuch there are, as he has properly authorized to declare his intentions relating to it;—and from these authorities only.

4 IV. If neither the words of the institution of any rite, not the circumstances in which it was instituted, nor the declarations of those who alone are duly qualified to declare its design, contain or imply a promise of any peculiar rewards attending the performance of it; or a threatening of any peculiar punishments attending the omission of it;—the rewards, or punishments, attending the performance of omission of such rite, can be no other than the good or evil arising from obedience or disobedience to any express command of the insticutor; and the good or evil naturally resulting from the due performance or omission of the actions themselves in which the rite consists.

Such are the principles on which this judicious divine has founded his scheme; principles which, we imagine, no sober and confiderate mind will be disposed to deny. The conclufions which he draws from them respecting the nature and defign of the Lord's Supper, are, in our opinion, equally just and incontrovertible. But this must be left to the judgment of the Reader.

' Vil. The design of the Lord's Supper must be learnt from the words of Jesus himself at the institution, considered jointly with the circumstances attending it; and the declarations of the Apostles re-

lating to it, and from no other authorities whatfoever.

'VIII. The history of the institution of the Lord's Supper is delivered by the Apostles in the following pssfages, and in them only; viz. Matth. xxvi. 26, &c. Mark xlv. 22, &c. Luke xxii. 19, &c. Paul, 1 Cor. xi. 27, &c.

Here our Author recites the passages at length.

<sup>\*</sup> Read karned, here and elsewhere.

XI. From these accounts given us by the Apostles of what Jesus faid and did in instituting this rite, it evidently appears,

'1st, That Jesus commanded the Apostles to observe a practice of breaking and eating bread, and drinking wine together, in remem-

brance of him.

' 2dly, It appears from the relations of the Apostles, that Jesus commanded them to do this, not as a mere general remembrance of himself; but that they should eat the bread, as a memorial of his body, broken or given for them; and the wine, as a memorial of his blood shed for them; and consequently, both together as memorials of his death; and surther, of his suffering death for many, that is for all, for remission of sins.

' 3dly, It appears, that the words and actions of our Lord, in infituting this rite, confidered in themselves; do neither express, nor imply any thing more as contained in this rite, than what has now

been explained.

of Jesus on this occasion, considered in themselves, do not contain or imply, either a promise of any special reward, that should attend the performance of this rite, or a threatening of any special punishment that should attend the omission of it, or any thing more than a plain description of the rite itself, and a positive command to celebrate it.

'XII. The Lord's Supper was not inflituted by Jesus for the obfervation of the Apostles alone, but was enjoined by him for a standing rite of his religion, to be perpetually celebrated by all who should

ever profess themselves his disciples.'

In this place Dr. Bell has introduced an ingenious, ftrong, and conclusive argument, in proof of the authority and perpetuity of this Christian rite; but which, we think, according to his general plan, should rather have made a part of the Appendix. For the particulars of his reasoning we must refer our Readers to the work itself.

All. All the benefits we are warranted in expecting from the due performance of any rice instituted by Jesus, to which no special benefits have been positively annexed, can be no other than these:

'1st, That approbation of God which an intentional compliance

with his will must certainly procure.

<sup>4</sup> 2dly, And, whatever additional strength our principles and habits of virtue may naturally acquire by the celebration of any religious rite, owing to the virtuous tendency of the rite itself.

'XIV. All the evils we are warranted in apprehending from the omiffion of any rite inftituted by Jesus, to the omission of which no special evils have been positively annexed, can be no other than these:

1st, That disapprobation of God, which an intentional disobe-

dience to his will must certainly produce.

'2dly, And the loss of whatever additional strength our principles and habits of virtue might naturally acquire by the celebration of any particular religious rite, owing to the virtuous tendency of the rite itself.

'XV. Since neither the words nor the actions of Jesus, in instituting the Lord's Supper, do in themselves contain or imply a promise of any special benefits to reward the celebration of this rite, or a threatening of any special evils to punish the omission of it, it must be granted, that there neither are, nor can be, any other benefits attending

tending the performance, nor any other evils attending the omiffiont of it, than those just described in propositions XIII. and XIV. unless it shall be found, either that some circumstances yet unnoticed accompanied the institution of it, which will give some peculiar meaning to the words and actions of our Lord in the institution; or that
the Apostles, in their writings, have communicated to us some particulars of its nature and effects, which neither the words or actions of
fesus in the institution itself, nor the circumstances attending it imply.

The only peculiar circumstance, according to Dr. Bell, attending the institution of the rite in question, was, 'That the supper at which it was instituted was not a mere common meal, but the paschal supper: and the only passages in the writings of the Apostles, from which any intelligence may be collected, refpecting the nature and design of the Lord's Supper, are, 1 Cor. x. 14. - xi. 1. and 1 Cor xi. 20-34. But from neither of these can any thing be justly inferred inconsistent with the account already given of this Christian rite. In the sequel of his discourse, this ingenious and judicious Writer proceeds to confider and illustrate, upon the principles already advanced, the apparent intention of Jesus in appointing such a memorial of his death; what is necessary to the due celebration of it, and the beneficial confequences arising from a ferious and devout observance of it; and to guard his readers against some super-Ritious notions and enthunaftical expectations which arise from mistaken ideas of the nature and design of the Lord's Supper. After which he sums up the whole in the following

'Conclusion. If the principles above laid down are true, and

the consequences drawn from them just, it follows,

That the Lord's Supper is a rite of the simplest and plainest na-

ture, perfectly intelligible to every capacity.

'That it is nothing more than what the words of the inftitution fully express, a religious commemoration of the fufferings and death of Christ, and the general purpose for which he died;—which it is the absolute duty of every one who believes in him to celebrate, because he himself enjoined it;—and which requires nothing more for its worthy celebration, than that intentional obedience, and serious disposition of mind, which deliberate resection upon the particulars commemorated in it will naturally produce.

That as the performance of it is not attended with any other benefits than those we ourselves take ease to make it productive of, by its religious influence on our principles and practice, so nothing but our own want of seriousness and good intention in performing it can

possibly make it productive of any danger or evil.

That as its primary object is the commemoration of the sufferings of our Lord in accomplishing the adopted plan of our redemption, we ought always to be disposed to assist at it, with the same readiness, the same thankfulness, and the same case and satisfaction of mind, with which we offer up our thanksgivings to God in our constant acts of worship.

And, in fine, that though it is left to our own discretion how often to celebrate it, nothing can so well manifest our proper ideas

of, and attention to it, as an habitual performance of it, whenever an opportunity is purposely afforded us; while an habitual omission of it, when set before us, must unavoidably convict us, either of ignorance of its universal and perpetual obligation; some misconception of its nature and effects; or an intentional disobedience to a positive Christian duty.—The injunction of our Lord is always a reason for performing it; and, if rightly understood, there cannot be any good reason for avoiding it; confishent with those principles which habitually influence the conduct of a man of virtue, and upon which whoever professes himself a Christian would be understood to act.'

The Appendix is divided into fix Parts or Numbers. No. I. Dr. Bell considers the resemblance between the Lord's Supper and the Jewish Paschal Supper, and the consequences that may be deduced from that resemblance. No. II. is a critical inquiry into the meaning of St. Paul in what he has advanced relating to the Lord's Supper in I Epift. Cor. ch. x. ver. 14. to ch. xi. ver. 1. and a judicious paraphrase of the whole passage. No. III. contains an explanation of that passage fage in the following chapter, in which the Apostle reproves the Corinthians for the impropriety and indecency of their behaviour when affembled to celebrate the Lord's Supper: viz, ch. xi. ver. 20-32. In No. IV. our Author considers another passage in the same Epistle, ch. v. ver. 7, 8. and proves, that so far is it from communicating any new intelligence respecting the nature or design of the rite in question, that in fact the Lord's Supper is not so much as alluded to in it. In No. V. Dr. Bell distinctly replies to Dr. Cudworth's argument, founded on what St. Paul has faid relating to the Lord's Supper, I Cor. x. 14, &c. to evince that it is, A Feast upon Sacrifice: And in No. VI. sets himself to prove in general, that upon the obvious fundamental principles of the Christian religion, the Lord's Supper cannot have the same respect to the Christian sacrifice, meaning thereby the death of Christ, which the Jewish and the Gentile feasts had to their sacrifices. Upon this last point, we cannot but think, that his reasoning would have been more clear and conclusive, if he had not embarrassed himself with the ideas of atonement and merits, or had observed that the death of Christ is termed a sacrifice merely by way of allusion, in the same manner as thanksgiving, faith, repentance, and in general a conduct agreeable to the Christian profession, are termed sacrifices.

As a specimen of our Author's critical abilities, we shall prefent our Readers with the following extract from No. II. in which he has with great judgment corrected an incidental mistake of Bishop Hoadly, and other writers on this subject, as well as of the generality of commentators.

Gg3

"Remark

Remark 2. The next words in the original whose meaning has been made matter of dispute, and upon the supposed meaning of which all the notions which have ever been embraced of fomething mysterious in the nature of the Lord's Supper have been chiefly, if not entirely founded; are-Konoma in ver. 16.; and Konoms in ver. 18 and 20.; and µ1712(11) in ver. 17, 21, and 30.

Kerrana-zerang-zerana 1st, Signifies merely the connection, participation, partnership, agreement, &c. of one person or thing with, in, or of, another person or thing; without any reference whatever to the joint participation,

&c. of more than one in the same thing.

As 2 Cor. vi. 14. viii. 23. Ephes. iii. 9. Philipp. ii. 1. iii.

Tim. v. 22. Philem. 17. And 1 Pet. v. 1. 2 John 11. And this is exactly the manner in which it is used in the very passage

in question, 1 Cor. x. 16.

zdly, Where several persons or things are spoken of as partaking of any thing, this word itself does not express collectively the joint participation of all; but simply the distinat participation of each: that is, in other words, it expresses the mere participation itself, and mothing more.

6 As Rom. xv. 27. 1 Cor. 3. 9. 2 Cor. i. 7. xiii. 13. ii. 9. Heb. ii. 14. x 33. 1 Pet, iv. 13. 2 Pet. i. 4. 1 John i. 4 3, 6, 7. Matt. xxiii. 30. Luke v. 10. And so it is used likewise in the passage before us, 1 Cor. x. 18, 20.

3dly, When St. Paul would express, in this word itself, the idea of the joint partaking, &c. of more than one in any person or thing, he distinguishes his meaning by prefixing to it the particle-ou-

'As Rom. xi. 17. 1 Cor. ix. 23. Ephes. v. 11. Philipp. i. 7. iv. 14. And so John, Rev. xviii. 4.

\* μτιχιν-μτοχος-μιτοχη\* 1ft, Signifies merely one person's or thing's partaking of, agreeing with, &c. another person or thing; without any reference whatever to the joint partaking, &c. of more than one in the same thing:

6 As 1 Cor. ix. 10. x. 30. 2 Cor. vi. 14. Heb. ii. 14.

2dly, When several persons or things are spoken of, as partaking, &c. of any thing, this word itself does not express collectively the joint partaking of all, but simply the diffind partaking, agreement. &c. of each, with the thing spoken of: that is, it signifies the participation itself, and nothing more.

As 1 Cor. ix. 12. Heb. iii. 1, 14. vi. 4. xii. 8. And in th.

passage before us, 1 Cor. x. 17. 21.

4 3dly, When St. Paul would express, in this word itself, the ide of the joint partaking, joint agreeing, &c. of several together in an person or thing, he distinguishes his meaning by prefixing to it the particle-ov.

· As Ephes. iii. 6. v. 7.

The word zorrana sometimes fignifies benevolent affistance, or charitable contribution towards those who fland in need of it. As Rom, xii. 19. 2v. 26. 2 Cor. viii. 4. ix. 1. 13. Gal. vi. 6. Philipp. i. 5. iv. 15. Heb. xiii. 26. And sq. Acts ii. 42. But with this application of it we have here no concern, and when used in this fense it is eafily diftinguished. 4thly,

4thly, The words persexen and zonemen, persoxos and zonemos, are used synonimously, as well in the internal or spiritual, as the external or material fense:

' As 2 Cor. vi. 14. Heb. ii. 14. iii, 1. 14. vi. 4. So, particularly, Luke v. 7. compared with v. 10. And so likewise in the very passage under consideration; as will appear by comparing 1 Cor. x-16, with ver. 17 t.

From these indisputable proofs of the sense in which St. Pauluses these words it is abundantly plain, that they must be interpreted in the same sense respectively in those verses where they occur in I Cor. ch. x. And more especially, as what is of the utmost importance to the true interpretation of ver. 16, it appears from these proofs, that St. Paul having here made use of the simple word xorona, not the compound συγκοινωνια, its true and whole meaning in this verse must be-each person's partaking, or participation, of the body and blood there mentioned, and nothing more 1.

"And the true sense of zarana in this passage being thus ascertained from St. Paul's undoubted use of it in other places; it is of great moment, I apprehend, to observe further, what, as far as I know, has never yet been properly attended to, that though St. Paul has actually inserted this word only in the latter part of each of the questions he here asks, the obvious sense of the questions themselves absolutely requires it to be understood in the first part of each question The cup or wine itself in this rite is the blood of Christ; but it must be the partaking of the cup, that is the partaking of the blood of Christ; in like manner the bread itself is the body of Christ; but it must be the partaking of the bread, that is the partaking of the body of Christ. This is self-evident. And from this observation,

<sup>†</sup> Here the Author refers to the following Note at the end of the Appendix. Had Bishop Warburton happened to have observed the perfectly corresponding meaning of these words in the several passages here referred to, he could not, it is prefumed, have inclined to the opinion, as he does (a), in-specified to Bishop Hoad-ly (b), that xenema was used to fignify the inward or spiritual part in the Lord's Supper, and mersyes the external part only. In fact, it appears from the pullages referred to, that there is not any ground for such a distinction; and senema here fignifies nothing elfe than the participation of the bread and wine confidered as the appointed representatives, or memorials of the body and blood.

<sup>1</sup> Upon this paragraph is the following Note at the end of the Appendix.

Bishop Pearce in his Commentary, and Note Q, on ver. 16.; as well as in his Commentary, and Note S, on ver. 18.; and his Commentary, and Note W, on ver. 20 ; is very particularly careful in repeatedly interpreting the word momenta, at fignifying the common, or joint participation of feveral together in the same thing; and Bishop By Hoadly likewife has interpreted it in the same manner (c). But if they had happened to observe, what is so sully proved by the passages referred to in pages 67-70, that St. Paul uses sources itself to express merely the participation, &c. of one only, of whatever it may be; and that when he deligns to express the common, or joint participation of feveral together in any thing, he makes use of the compound word our not include the idea of joint participation (d); though he had not observed the use Stall Paul makes of the compound suprement, when he would express that meaning.

<sup>(</sup>a) Rational Account, &c. p. 35-37. (b) Plain Acc (c) See Plain Account, &c. p. 33, 34-39-43.-3d edit. (d) Rational Account, &c. p. 33-35. Edit. 12mp. 1741. G g 4 (b) Plain Account, p. 45, 46.

joined to the foregoing, in which the meaning of zoumz was afcertained, it necessarily follows, that in order to comprehend St. Paul's true meaning, we must here understand by the cup, and the bread, the zouma, or partaking of the cup and the bread, in the first part of these questions; to answer to the zouma, or partaking of the body and blood in the last part of them.'

Then, after some observations to prove, that the bread and wine are flyled the body and blood of Christ in the same sense as the Pasthal lamb is called the Lord's Passover\*, that is, a religious memorial of that transaction, he thus concludes his obser-

vations on ver. 16.

From these several remarks that have now been made it appears, that, in order fully to express the true sense of St. Paul, and nothing but his sense, in ver. 16. it must be translated in the following manner:

Ver. 16. The partaking of the cup of blessing, which we bless, it is not, to each of us, the partaking of the memorial of the blood of Christ? The partaking of the bread which we break, is not not, to each

of us, the partaking of the memorial of the body of Christ?

To this we shall subjoin an extract from No. III. containing remarks on the phrase, guilty of the body and blood of the Lord, a Cor. xi. 27, as it includes an explanation of a similar expression in the Epistle of St. James, which has been generally misunderstood. Having justly observed, that these words in this place cannot with any truth or propriety be understood in their first and obvious meaning, viz. guilty of putting Christ to death, and having offered some considerations to prove, that the intention of St. Paul was to affert, 'that whoever behaved at the celebration of' the Lord's Supper 'in such a manner as to shew a thoughtless difregard, and want of serious attention to it, did by that particular misbehaviour—shew a difregard, and want of serious attention to the sufferings and death of our Lord; in some small degree similar to, though by no means to be compared with, that of those who actually caused him to be put to death,' &c. he makes the following remarks on the phrase:

The original is, ενοχος ες αι να συματος, &c. and the word ποχος is of such extensive use and application, that on different occasions the obvious sense of the passages will force us to translate it in very dis-

ferent manners.

۳.

In Matt. ch. xxvi, 66.—1000000 Samere are; and Mark, ch. xiv. 64.—10021 woxon Samere; it may with propriety be translated, gailty of hecause, gailty of death, is an elliptical expression, which use has rendered familiar; and the meaning of which answers exactly to the meaning of the word in these two passages.

But in Matt. ch. v. 21, 22.—110χος στι τη πριστι—τιμ συνιδείμη,—τις την γεινική:—and Mark iii. 29.—110χος ετιν αιωνιου περιστως;—and Heb, ii. 15.—110χοι πσαν δουλειας;—in all these passages it must of necessity

be translated-subjett to, exposed to, liable to, obnoxious to, &c. and

sannot possibly be rendered guilty of.
And in 1 Cor. xi. 27. the passage under consideration, 100000 15000 του σωματος; as well as in James ii. 10.—γεγονε παντών ειοχο, which is exactly fimilar to it; to give it its true and proper meaning, it must be rendered in a different manner still; such as,—offends againsts—affrants—shows a disrespect to, &c.—Or, still more fully, is guilty of offending against—guilty of affronting—guilty of showing a disrespect to, &c.—Not absolutely, guilty of the body and blood of Christ, in the one instance; or, guilty of all the commandments, in the other.

. The necessity there is for translating the word in this manner, in these two perfectly similar passages, is not only evident from the reafon of the thing, but likewise from St. James's explanation of his

'St. James says , Whosoever shall offend against one commandment of the law—yeyou warrow 10000; which we translate,—is guilty of all.—But here the evident reason of the thing must convince us that this translation is improper; because it makes St. James affirm what is manifestly false; and what indeed he himself has informed us, he did not mean. Whosoever breaks one commandment of the law only, is far less guilty than he who actually breaks them all. The utmost that with truth can be faid of him who breaks one only, is, that he offends against, or affronts, or seems a disrespect to, all; by offending against, in one instance, that authority which equally enjoins all: and this the Apostle himself has informed us was exactly what he meant t. Here therefore it is manifest, that mogos yegon should not have been rendered absolutely, is guilty of; but ought to have been translated, becomes an affronter of, or becomes guilty of affronting, or spewing difrespect to, all the rest.

And for the felf-same reasons, in the passage before us, 200000 gryon I το σωματος ought not to have been translated, absolutely, is guilty of the body, &c. but should have been rendered by some such expresfion as, offends against, affronts, shews a disrespect to; or, more fully, is guilty of offending against, affronting, or showing a disrespect to, the body and blood; that is, the memorials of the body and blood, and

consequently the sufferings and death of Christ 5.

We could willingly make some farther extracts from both the Appendix and the Notes; but our limits forbid. What we have already transcribed will give our Readers an idea of the entertainment they may expect from this ingenious publication; which we earnestly recommend to the perusal of every one who is desirous to form just and accurate notions of the Lord's Supper, as the most complete, rational, and satisfactory treatise on the subject hitherto published, written with equal learning and

<sup>.</sup> Ch. ii. 10. † James ii. II. I It should have been agai. The Reader may have the fatisfaction of finding this interpretation confirmed by the authority of Bishop Pearce, in his Commentary, and Note upon the passage, vol. ii. p. 270; though there, in the Note, by filling up the words of St. James thus,-is guilty of the breach of all — he undefignedly goes further than either his own inter-pretation of the original word, or the reason of the thing, will warrant. See likewise his Note on Matt. v. 21, vol. i. p. 30. judgment,

6,3/4, judgment, and discovering in the worthy Author the most commendable liberality and candor of sentiment and disposition.

19103. ART. XI. Sermons, by Alexander Gerard, D. D. Professor of Divinity in King's College, Aberdeen, and one of his Majesty's Chaplains in Ordinary in Scotland. 8vo. 5 s. Boards. Dilly. 1780.

robe of mild persuasion, and seldom attracts the Reader's regard by the ornaments of sancy, yet she steps forth in the sober and decent attire of reason and good sense. Dr. Gerard addresses himself more to the understanding than to the heart, and his discourses are distinguished from most compositions of the same kind by perspicuity and strength of reasoning, by a manly and philosophical way of thinking.

Three of his fermons, if our recommendation can have any weight, will be perused by our Readers, with the most serious attention. The subject of them is of great importance, as it comes "home to men's business and bosoms;" though there are sew, even of those whose characters are, upon the whole, respectable and exemplary, who attend to it as they ought.

The Doctor discourses from Prov. xxviii. 28.—He that bath no rule over his own spirit, is like a city that is broken down and without walls.—He begins with observing, that the spirit of a man is an expression, which has different significations in scripture, especially in the book of Proverbs; but he considers it as signifying a man's particular temper, or predominant turn of mind: so that Solomon may be understood to affert, that he who hath no command over his natural temper, or peculiar bias, is in danger of running into every sin.

After this introduction, he proceeds to explain the origin and nature of the variety of tempers among mankind; and this he does with much distinctness and accuracy, and in such a manner as will be peculiarly pleasing to readers of a philosophical turn of mind.

He observes, that, among the diversities of character of which men are susceptible, there is scarcely any more remarkable or more interesting, than that which belongs to the natural temper; that this diversity may be increased by a difference in the education and culture which men receive, and in the habits which they contract; but that it is not produced by these; that it is founded in the original constitution; that it appears in children from their very birth, and continues to distinguish perfons who have received the same culture, and acquired the same habits—that both the temperament of the body and the turn of mind contribute to form the peculiar bent; that the latter requires principally to be regarded, as it instuences the temper most

most directly; the former affecting it only indirectly, by first affecting the turn of the mind—that it arises both from the peculiar make of the understanding, and from the construction of the passions and active powers; but that, in most instances, the latter is its chief and most immediate cause, either by the predominance of one passion in the constitution, or by the gene-

ral tone of all the passions.

The Doctor confiders the several tempers, that are found among mankind, simply in themselves, and not either those excesses of them which are vicious, or that regulation of them which is virtuous, though he is often obliged to speak of them by names which imply approbation or disapprobation, especially the latter. The reason, he tells us, is, that as all tempers are most obvious in their excesses, and as some are very apt to run into excess, we have in many instances no name for the temper itself as distinguished from the abuse of it. We must, therefore, he says, be on our guard against deception from this impersection of language, and endeavour, as much as possible, to conceive every temper that may be mentioned, as in itself indifferent, however readily it may on the one hand degenerate into vice; or however easily it may on the other hand be improved into virtue.

He now proceeds to a more particular investigation of his subject, and shews, that all the affections and passions, according as one or another of them is predominant, tinge the whole

foul with their own peculiar hue.

He observes, that very great diversities of temper may proceed from the same passion, only by its being predominant in different manners; that the passionate temper and the peevish are extremely different, though they both proceed from the predominance of the very same principle, sudden anger; that deliberate anger produces, in those who have a propensity to it, many distinctions of temper unlike to both these; that whatever be the varieties of which any passion is susceptible in respect of its causes, its objects, its feeling, or its tendencies, the temper founded in that passion will be susceptible of all the same varieties—that some tempers proceed from the weakness of a particular disposition, more properly than from a predominance of the contrary; that courage, so far as it is conflitutional, proceeds merely from the absence of fear; that impudence is not the prevalence of any positive affection, but only the want of shamethat several passions and affections are, in different men, combined in an infinite variety of ways; and that every particular combination of them produces a distinct temper; that every temper, when it is analysed with the utmost accuracy, will perhaps be found, not to arise from the prevalence of a single affection, but to derive its form in some degree from the union of

feveral: thus fainter traces of feveral dispositions, are often discernible in a countenance, which yet receives its principal expression and general form from one affection—that it is not only by the prevalence of some of them in comparison with the rest, that the passions produce diversities of temper among mankind; but that the general tone of all the passions occasions a suitable

peculiarity.

Though the passions be the most immediate causes of the varieties of temper, he further observes, that the understanding has not only some influence on every peculiarity of temper, but also that some peculiarities of it cannot be at all explained without taking into the account the turn and degree of the understanding; may, that some peculiarities of temper are occasioned almost wholly by the form of the intellectual powers—that some men have a propenfity to observe accurately, without any formed defign, whatever comes in their way; that this propenfity lays the foundation of an attentive turn; that a heedless temper arises from the want of this propensity—that some men have reasoning minds; that whatever object is before them, they place it in every attitude, view it in every light, and investigate all its confequences; that this turn of understanding lays the foundation of a confiderate, provident temper, and the contrary turn, of a thoughtless, rash, improvident temper;—that the same temper may, in different men, proceed from different causes, and even opposite tempers may proceed from the same cause.

Having explained the origin and the nature of the variety of tempers among mankind, in his first sermon, he proceeds, in the second, to shew the necessity of our governing, each his own peculiar temper, and to point out the ill consequences of neglecting it. In the third, he shews how the duty of governing the natural temper ought to be performed, and to explain what is implied in the government of it; but we must refer our Readers to the sermons themselves, where they will find this

important subject treated in a masterly manner.

The Sermon on constancy in religion, &c. is a very judicious discourse, and contains some observations which we do not remember to have seen so happily illustrated by any other writer. The Dostor shews very clearly, that, by deviating from virtue, we can obtain no security against those afflictions and forrows which are common and even universal in human life.

The subjects of the other sermons are—Justice the Decorum of the Character of Judges, preached at the affizes—the first Promise of the Redeemer—the Promise of the Redeemer to Abraham—the Old Age of the Righteous honourable—Virtuous Solicitude—Regard to positive Institutions essential to Goodness of Character—Redeeming the Time—the Truth of Christianity confirmed, &c.—the Power of virtuous Resolutions—the Advantages of the Virtuous for the Enjoyment of external Good—

the House of Mourning more improving than the House of Feasting.

ART. XII. Account of the Philosophical Transactions, Part II. for the Year 1779, concluded.

MATHEMATICAL.

Article 32. On the Precession of the Equinoxes produced by the Sun's Attraction. By the Rev. Mr. Isaac Milner, M. A. and Fellow of Queen's College, Cambridge.

THE purport of this ingenious paper is, as Mr. Milner hints, rather to explain and establish, on the most solid foundation, the philosophical principles on which the mathematical calculations of this most interesting problem are founded, than to illustrate the method of calculation itself, although he has not altogether neglected the latter. And he shews, contrary to the opinions of some, that the result will be very different if the ealculation be sounded on a supposition that the earth is a mass of sluid matter, under the form of an oblate spheroid, from what it will be if supposed a mass of matter, persectly rigid, under the same form.

Having established, in the clearest and most incontestable manner, the first principles, he proceeds, by a very short and elegant calculus, to enquire into the quantity of the annual precession of the equinoxes, caused by the attraction of the sun, and finds it to be 21" 6", agreeing exactly with the result which Mr. Simpson has given us in his Miscellaneous Trass, published in 1757, as well as with several other authors who have written since that time, and which is somewhat more than double the quantity assigned to it by Sir Isaac Newton, at p. 476 of his Principia, Edit. 1726.

Mr. Milner next enquires into the cause and seat of Sir Isaac's error; and concludes that it is not where Mr. Simpson has supposed it to be, namely, in assuming as a principle, which he does in his 30th proposition of the 3d book, "That if a ring, encompassing the earth at its equator, but detached therefrom, was to tend or begin to move about its diameter with the same accelerative force, or angular celerity, as that whereby the earth itself tends to move about the same diameter through the action of the sun, that then the motion of the nodes of the ring and of the equator would be exactly the same."

But, fays Mr. Milner, if the error be not here, it will be asked, where is it then to be looked for? To this question he does not appear to be absolutely prepared with an answer, but seems to think, with Father Frisus, in contradiction to what has been advanced by Simpson, that it see in Newton's supposing that

that the motion of the nodes of a ring would be the same, whether the ring were stuid, or consisted of hard rigid matter; and also the same with the motion of the nodes of a satellite moving upon the surface of the earth in the plane of its equator, and making one revolution in the time of a syderial day. But he intimates, that at some future opportunity he may further consider this matter.

We rather marvel why, when he is enumerating the feveral authors who have investigated this curious subject, he should take no notice of one of the most valuable papers that have been offered to the public upon it; namely, Art. 15. Part I. of the Philosophical Transference for the public or the

the Philosophical Transactions for 1777.

HYDROSTATICS.

Article 37. A Treatife on Rivers and Canals. By Theod. Aug. Mann, Member of the Imperial and Royal Academy of Sciences at Brussiels.

This long paper, which takes up more than 100 pages of the Transactions, is divided by the Author into six sections, beside the introduction.

In the first, he treats of the different purposes for which canals are made, and gives a short account of the principal authors

who have written on the subject.

In the fecond, he distinguishes between natural and artificial rivers, as no terms them; that is, rivers whose channels are dug by hand, but which have not their waters kept up by fluices or flood-gates; and those again from such as have their waters kept up by these means, and which, alone, he calls canals. He defines such terms, used by himself in this paper, as have not been made use of by others before him, or that have been used in a less determinate sense than he chuses to confine them to; and delivers the laws by which waters, flowing in rivers and canals, act; referring to the authors mentioned in the first section, for the demonstrations of these laws.

He next enumerates the several inherent causes of the acceleration and retardation of the motion of water in rivers and canals; he shews by what means this motion may be either augmented or diminished, as circumstances require; and he explains divers methods of trying the velocity of the current, and finding whether the water slows swiftest at the top or bottom of the stream. From the principles thus laid down, he deduces various means of preventing and remedying the defects and inconveniencies which must necessarily happen to rivers, &c. in a series of years, from the reiterated action of the water on their banks, and many other, as well natural as accidental causes: and explains the nature and causes of inundations; why they are more frequent in some rivers than others, and always less frequent in large than small ones; at the same time shewing how they may be prevented, or at least rendered less frequent,

**Mpcle** 

where the object will answer the expense. He concludes this section with some remarks on the confluence of rivers, and on the separation of the same river into many branches, as is usual in large rivers especially, near their mouths, or influx to the sea; and explains the effects which these circumstances have on the velocity of the currents, inundations, &c.

In this section he investigates the laws which obtain when currents running in opposite directions meet; and he observes that, 'when two equal currents of homogeneous fluids meet in opposite directions, there is first a swelling and rising up of them, at the point of rencounter; then follows a revulsion and counter-current of each equally back again, so as to bring the

whole to an equilibrium.'

If the two opposite currents are unequal, either in force or in quantity, or both, there will still be a swelling and revulsion of each back again; but it will be diminished in the greater current, and augmented in the less, in proportion to the quantity by which the one surpasses the other; and the point of rencounter of the two currents will have a flow and progressive motion in the direction of the stronger, the degree of velocity thereof being always in a direct ratio of the force and quantity of one above the other.

'If the fluids in opposite currents be not homogeneous, as is the case between sea and river water, that which has the least specific gravity will swim upon the other, and continue to follow its first direction, until such time as the heavier sluid shall have communicated its motion to all the parts of the lighter. But the lighter sluid will not lose its former motion and direction at once, but in a decreasing series, the law of which will vary according to the greater or less specific gravity in the two sluids, until the whole of the lighter has acquired the velocity and direction of the heavier, which buoys it up.

The time and space required for a greater current of salt water to communicate its motion and direction to an opposite one of fresh water, will be but very little, since they differ in specific gravity only 73 parts, which the salt is heavier than the fresh. It would require much greater between water and oil, and still much more between quicksilver and oil, and so on. The elements for determining them in every case might be sound by a proper number of experiments.

Let the two currents be equal or unequal in force and velocity, but nearly of the same specific gravity, if we should suppose, at the same time, that their surfaces are not upon a level, but that the one is higher than the other (as is constantly the case in all sluices that open to the sea, except at the moment when the surface of the tide is on a level with the surface of the water in the canal behind the sluice), this circumstance entirely changes both the case and effects. It is certain, on this supposition, that the overplus of velocity and elevation in the higher current, though it should be the lesser, will make the waters in the lower and greater current reslow upon themselves, until they come to a level and equilibrium with those in the upper current; since these, by the laws of universal gravitation, cannot flow back from a lower to a higher level, but must descend according to the declivity of their surfaces. If the currents are of very dif-

ferent specific gravity, they will come to an equilibrium according to the law laid down above; but their greater or lesser quantity and ve-

locity will produce little or no effect in this case,

Now, as the running of two currents in opposite directions, after their rencounter, and beyond the limits laid down above, is incompatible with, and contradictory to the laws of nature, and consequently impossible, we may draw this useful conclusion, which becomes important during inundations, and especially during the annual overflowing of the low grounds in flat countries; to wit, that if the fluices next the fea, against which the tide flows, be shut only a quarter of an hour before the flood has risen to the level of the water in the canal, not a drop of water can enter the faid canal, nor even into the suice itself; because both the progressive motion of the point of rencounter of the two currents, and the over-swimming of the fresh water upon the salt, will be always without the sluice and sowards the sea, so long as the surface of the tide is below the level of the water in the canal. Many sluice-masters, for want of knowing or considering this, are accustomed to shut their gates next the sea a little after balf flood, under the pretence of preventing, by this means, the falt water from getting into the canal, and communicating thereby with the waters which overflow the low grounds in many places during the winter, which would be of great detriment to the soils Through this false persuasion, they lose no inconsiderable part of that time every day, which they might fafely employ in drawing off the waters which overflow and incommode low and flat countries, almost every winter and rainy feason, as is the case in the Dutch and Aufirian Netherlands;' as well as many parts of the counties of Norfolk, Cambridge, and Lincoln, and other parts of England.

Section IV. contains an account of fundry experiments made by the Author, at the request of Mr. Needham, Director of the Imperial Acadumy of Sciences at Bruxelles, for determining the different velocities which the same floating bodies will have in different depths of water, when urged by the same force. Dr. Franklin, in a letter to Sir John Pringle, written so long ago as the year 1769, has shewn, that it is well known amongst people accustomed to work boats on canals, that there is a consisderable difference in the swiftness of their motion, according as they float in a greater or less depth of water; and that the water being shallow is of itself sufficient to retard the motion of a boat, notwithstanding its keel may not touch the bottom of the The reason he assigns for it is evident; for a boat cannot advance its own length without displacing a quantity of water equal in mass to the space which the boat occupies under the furface of the fluid. The water so displaced must return, and pass underneath and by the sides of the boat; so that the less depth and breadth of water there is in the canal, the more in proportion it must rise up and press against the boat, and of course retard its motion.

The result of the experiments here related by Mr. Mann is as follows:

When the body, which was made in the form of a vessel commonly called a bilander, floated in 15 inches of water, and was pulled by a weight of eight ounces, which was just sufficient to draw it along, it passed over a canal of a certain determinate length in 143 feconds. When in 14 inches of water,

it passed the length of the canal in 15 seconds.

In 13 inches it passed in 151"; in 12 inches of water it required 16"; in 11 inches, 16;"; in 10 inches, 17;"; in 9 inches, 18;"; in 8 inches, 20"; in 7 inches, 23"; and in 6; inches it required 30". In this last experiment, the body which drew 6 inches of water touched the bottom several times. It appears from these experiments, that in the several depths of water which are here made use of, the times are, very near, in the inverse ratio of their depths; but there can be no doubt but that if the ingenious Author had proceeded to greater depths, he would have found the differences in the times insensible, as is manifest without more words.

The fifth section treats of the quantity of declivity which is usually found in natural rivers; and he shews, from a great number of examples, that it is generally from I fathom in 12,000 to I in 1700: and that from the motion being scarcely fensible in the first, it will run at no less a rate, in the last, than 80 fathoms in a minute of time.

The fixth fection contains 'a general and easy method of . taking levels through large extents of country, where rivers pass; and also of computing the heights of interior parts of con-

tinents above the surface of the sea.

The subject of this section is, it must be confessed, chiefly conjectural; but it is not less curious and ingenious than the former; and we might give several extracts from it, which we are certain would give many of our Readers great pleasure; afford but we have already extended our account of this article to too great a length; and as the Author himself acknowledges that the matter it contains is founded on less certain principles than the former, it may be prefumed that fuch extracts would be rather more curious than useful.

# MONTHLY CATALOGUE,

For DECEMBER, 1780.

E R 1

Art. 13. A Reply to the Observations of Lieut. Gen. Sir William Howe, on a Pamphlet entitled, "Letters to a Nobleman;" in which his Misrepresentations are detected, and those Letters are supported, by a Variety of new Matter and Argument. By the Author of Letters to a Nobleman. 8vo. 3 s. Wilkie. 1780.

HIS indefatigable Writer fets out with the following declaration:—' Had the General,' says he, ' by a true state of facts, REV. Dec. 1780.

and by candid argument, free from personal abuse , convinced me that I was wrong; ever happy to acquit injured innocence, there is no concession, no act of justice, which my honour would not induce me to personm; but as the reverse is the case, the same motives which influenced me to write the Letters, oblige me to vindicate the truths they contain. — He has, accordingly, entered on a strict examination, paragraph by paragraph, of the General's Observations, which have, on this occasion, undergone a very severs investigation indeed! We presume not to decide on the result; but we cannot conceal our apprehensions, that, from an attentive consideration of the facts and circumstances adduced in this performance, many readers will be led to form conclusions which may prove bigbly disadvantageous to the reputation of the late commander in chief of the British forces in America.

Art. 14. An impartial History of the War in America, between Great Britain and her Colonies, from its Commencement to the End of the Year 1779; exhibiting a circumftantial, connected, and complete Account of the real Causes, Rise and Progress of the War, interspersed with Anecdotes and Characters of the different Commanders, and Accounts of such Personages in Congress as have distinguished themselves during the Contest. With an Appendix, equationing a Collection of interesting and authentic Papers, tending to elucidate the History. Illustrated with a Variety of Copper plates. 8vo. 6s. 6d. Boards. Faulder. 1780.

It is not to be expected that any detail of the events of the prefent American war can be given, while the dispute remains undecided, which shall merit the name of an impartial history. This is a work which must remain to be executed by some independent and judicious spectator of this great revolution, at a period when the events which are now unfolding shall have been brought so an issue, and when the present race of actors on the political theatra shall have left the stage. Till then, the best that can be expected is a simple recital of the several incidents of the war, as they have been often hastily, and sometimes partially related, in the memorials of the day. Such a compilation as this, collected from the most common sources of information, and put together without any traces of the hand of an eminent master, is here offered to the public.

Concerning the impartiality of this work, our Readers will probably entertain no very high opinion, when they are informed that the Author, in the virulence of party spirit, has taken upon him decitively to pronounce Dr. Price's Observations, sec. I destructive of all civil authority, of all subordination among men or estates. However, without searching farther into this Writer's political principles, we may venture to conclude, that a work thus made up, to gratify the curiosity of the day, can have little prospect of obtaining a place

The Author complains much of the General's secantingace in this respect; and the instances of what he deems personal abuse, which he frequently meets with in the Observations, have drawn from him an earnest desence of the character and conduct of Mr. Gallomay, sthe reputed author of Letters to a Nobleman, and of this publication in which desence he seems to have been successful.

smong the permanent records of history. The utmost that can be expected from it, and this may probably answer the Author's purposeis, that it should be made use of as a temporary register of occurrences, adapted in some measure to answer the ends of present information.

POLITICAL.

Art. 15. Lucubrations on Ways and Means, humbly addressed to the Right Hon. Lord North. By John Berkenhout, M. D. 8vo. 2 s. H. Payne. 1780.

Confifts of a few defultory observations on the present state of our public affairs; together with a long lift of proposals for new taxes, with a view to the laudable purpose of raising the necessary supplies within the year.—It seems, however, by the way, as though this lively ministerial projector considered the people as created like filly sheep, only to be fleeced: several of the Doctor's hints, appear, nevertheleis, to merit the fleecer's attention; and some of them might, perhaps, prove immediately beneficial to the flock.

·Novel.

Art. 16. The Surry Cottage. By James Penn, Vicar of Clavering cum Langley, Estex, Chaplain to the Right Hon. Earl Gower, and Lecturer of St. Ann's Alderigate. 12mo. 3 s. Bladon. 1779. The materials of which the Surry Cottage is composed, though

neither elegant nor curious, are at least found and useful. speak without a metaphor; much plain sense, and many practical aphorisms, may be collected from this unoftentatious little volume, for which, in more splendid performances, the Reader will frequently look in vain.

PORTICAL.

Art. 17. The putrid Soul : a poetical Epistle to Joseph Priestley, LL. D. F. R. S. on his Disquisitions relating to Matter and Spirit. By A. Bicknell, Author of the Life of King Alfred, &c. &c.

1 s. 6 d. Bowen. 1780. It is difficult to decide on the comparative merit of this Author, when we view him in the threefold light of a poet, philosopher, and theologist. In all three he is so completely deficient, that we are unable to determine in which character he disgraces himself most. His fystem (if we may be indulged in a figure of speech which rhetoricians call a catachresis) is a compound of the most crude and heterogeneous principles that ever were jumbled together by ignorance and vanity. From the dregs of Platonism he hath attempted to extract a fort of equivocal theology; and having mixed it up with some of the last runnings of modern mysticism, he hash here offered it to sale in a cracked poetical phial, as a forereign antidote to Dr. Priestley's bigbly relified. Spirit of matter!

This retailer of- fomething so old and yet so very new,'-adopts the long-forgotten hypothesis of the lapse of human souls in a preexistent fate;-of the flight of impure spirits, after their departure from this world, to some of the remoter planets, where they will undergo a degree of punishment, proportioned to the guilt they have contracted, till by progrettive steps (i. e. by going from one star to

, H h 2

another) they recover their original purity.

For

For the leading principle on which this conjecture is founded, our Author might avail himself of the venerable authority of an ancient and learned father of the Christian church. But in what school did he learn that,

To more than human mind can count,
Each vital spark of heav'nly flame
Which from the eternal Effence came,
Shall into that again resolve;
Created substance shall dissolve;
By unknown means again reduc'd
To th'principle from whence produc'd?

This doctrine of the resolution of souls into their first principle, and of consequence the total annihilation of individuality, or separate consciousness (which is the chief privilege of immortality), was never taught even by the wildest visionaries of the Christian church; notwithstanding this Author would affect to prove it by an appeal to the authority of the Apostle himself,

That finally, as fays St. Paul, The great supreme be all in all.

This Writer, in his poor attempt to ridicule Dr. P. hath run into a firain of grois and profane raillery, by introducing a subject that is too awful to be sported with—even the final resurrection, and the day of judgment. All that he hath advanced in his story about 'poor Thomas drowned in the Thames,' and at length devoured by 'a commonwealth of eels,' that were afterwards served up at a city feast, is at once so filly and so prophane, that we are at a loss whether most so despite or detest it.

Art. 18. A Plan for the better Regulation of Mariners in the Merchants Service, to increase their Numbers, and form the whole Body of British Seamen into a distinct Corporation, to be called the Fellowship of Seamen, voluntarily offering to service the State submicalled upon. Wherein are shewn the singular Benefits and Immunities which every Member of this Corporation will be entitled to, from his siris Entrance into the Fellowship, to the Time of his becoming incapable of Service, together with the Provision intended for him, during the Remainder of his Life. The Liberality of these Encouragements, it is submitted, will be a sufficient Inducement to Seamen to become Members of this Corporation; whereby the Royal Navy may at all Times, and on any sudden Emergency, be expeditiously manned, the Practice of Impressing rendered useless, and Commerce be uninterrupted by Embargoes at the Commencement of a War, or the Want of Protections during any Periods of it. By John Green. 8vo. 2 s. Bew, &c. 1780.

any Periods of it. By John Green. 8vo. 2 s. Bew, &c. 1780. This Writer juilly observes, what is indeed generally acknowledged, though perhaps not always sufficiently attended to, 'that the safety and prosperity of this kingdom depends principally on our marine strength.' His title-page sufficiently and diffusely acquaints the Reader, that his scheme proposes reciprocally the benefit of seamen and of the public. The savings to the State, which he apprehends would arise from the pursuit of his plan, amount to a large sum in-

deed, no less than 5,776,000 l. per annum! Beside which, he thinks i: would render mariners more numerous, more useful, more comfortable, &c. He particularizes the taxes which would be necessary in order to establish a marine fund, and a method of raising them without injury or burden to the public, or to individuals. We cannot, confishently with the nature of our work, enter into a farther enumeration of the several articles; but we must say, that his design appears to merit the attentive regard of those to whom the direction of national affairs and the public revenue is intrusted! In the dedication of this pamphlet to Lord Sandwich, we are informed, 'that the proposals here offered have undergone the serious consideration of a very numerous and respectable body of masters of ships, whose approbation, it is added, could not be more plainly manifested, than by their having unanimously petitioned parliament to carry them into execution; and this they did, because they saw most clearly, that were these measures adopted, Government would only have to find thips; the proposals would find men. He soeaks very highly of Sir Herbert Mackworth's spirited exertions to procure this scheme a fair parliamentary investigation.

Att. 19. Biographical Memoirs of extraordinary Painters. 12mo. 2 s. 6 d. sewed. Robson 1780.

The plan of this strange work, as far as may be collected from an advertisement prefixed to it, is 'to exhibit striking objects both of nature and art, together with some sketches of human life and manners, through a more original medium than those usually adopted in the walk of novel-writing and romance.' We are there likewise told, that 'whatever merit the plan of the following work may be thought to want in some respects, it is at least presumed to be new; and perhaps a better could not have been sound for the display of a picturesque imagination.'

Not content with studying this performance carefully, we have confulted both professors and virtuosos concerning it; but still remain in the dark with respect to the Author's real drift. The painters whose lives are here pretended to be given, are described under the strange names of Aldrovandus Magnus, Andrew Guelph and Og of Basan, his supposed disciples, Sucrewasser of Vienna, Blunderbussiana, and Wa-

On the first view of this performance, it naturally occurs, that the Author meant to draw some modern or living characters: but if such was his intention, we confess that we are not of that class of readers who can identify any one of them, in this mingled mass of true and statious history. The Author, however, is by no means a bad or uninformed Writer. In his performance the Reader will meet with some good descriptions, and some humour; which last however, loses its effect, through the ill-bumour into which the Reader is continually thrown, by the vexatious obscurity that pervades the whole work.

Art. 20. The Elements of Beauty. Also Reslections on the Harmony of Sensibility and Reason. By J. Donaldson. 12mo. 25. 1ewed. Cadell. 1780.

We are nearly as much at a loss to characterise this performance as she preceding; or to discover what was the drift or defigu of the Au-Hh 3 thor thor in compiling it. It confids of an ill-connected medley of observations, arranged in certain chapters or sections, in which the Author treats - of light, of found, of motion, of assimilation, of centrast, of personification, of charatter and expression, and of gracefulness. All that we can learn with respect to his plan is, that his defign was, ' to trace the progress of beauty, from its beginning in the fenses, to its second source of perfection in the mind; both centering in the consciousness of life or sensibility.

A strange and aukward kind of construction occurs frequently in this work.- 'Mellow and gentle tones of colour affociate with, and dispose to, the gentle and delicate of internal feelings, &c.'- The guident of the fenses ever affociating with, and disposing to, the violent or disagreeable of internal sensation.'- Bitter or sour things, &c. affect the bestile or discordant of passion."—We read, too, of mellow, soft, and gentle sounds, as best adapted to express ' the gentle of sentiment.'-We read likewise of a thing being ' congenial to life, or to the kindly and delicious of passion; -and of the pleasing of sense as-

. sociating, in all things, with the pleasing of sentiment.

As to the ' Reflections,' we shall content ourselves with transcribing the Author's final paragraph, in which he observes, that ' it has been instanced, through the whole of this performance, that scafibility, as directed by reason, constitutes wirtue.'- We have no inclination to controvert this affertion, or to transcribe any of the inflances contained in twelve sections, from which it is deduced. Art. 21. A B C Dario Musica. 8vo. 1 s. 6 d. Bath, &c. Sold by Bladon, &c. in London. 1780.

This unfeeling and cankered critic has arranged the names of various musical composers and performers, reliding in England, in alphabetical order; and has annexed their supposed characters, which he has generally comprised in the space of ten or a dozen lines; shough he has sometimes thought fit to condense them within three or Within such scanty limits he comprizes not only the praise or damnation which he is pleased to bestow, but likewise sometimes fa. yours us with short hints of the life and conversation, or with an account of the personal or mental defects of the subjects of his work.

Thus, to give an example from one of his longest articles—without, however, propagating his scandal by naming the person-after expending the first ten lines in speaking of the country, &c. of a certain celebrated composer and performer, and owning that his execution and expression are warmly to be applauded," he devotes the remaining nine to the giving us the following lights respecting his Aq. ture and his temper, which must certainly prove very edifying to the inquititive mutical reader.

Perhaps he has not more bile than is usually given by nature; but compressed into so small a compals as his frame, it overflows: and if we had not somewhat less malignity, ency, and ineffectual defraction, than he ('tie faid) exercises, he would not have experienced

the candour with which we have given his portrait,

Speaking of a certain capital performer on the violin, he telle us that f his execution is rapid and clean, his tones full and even, partigularly fo fince his good fense permitted that great maller Giardini to new-model the flyings and how of his influment.'- Here'too the reader is edified in another, and certainly much less exceptionable

In Signor Pacchierotti-[we can have no motive for concealing his name]—the delight, as we learn from all quarters, of every person possessed of taste and sensibility, this unseeling Cenfor does not diftinguish a fingle characteristic mark of excellence. We hear not a syllable of his taste, expression, feeling, fancy, and variety of embellishments; but we are readily told that 'he sings berribly out of tune.'-This inarler may have been so informed; or, with a menocherdi at hand, may have been capable of noticing occasional slips of this kind, by no means unusual to vocal performers in this Bastian climate. of ours—but he is utterly insensible to the excellencies that overbalance these occasional transgressions.

A country reader would at once conclude, from his short character of Mrs. Wrighten, that she is crooked and ugly. Out of four lines and three quarters, in which her character is comprised, this truly polite Critic devotes nearly three, to tell us that ' she is a very great favourite with the public, in spite of a bad person, and plainness of face? Those who have not, as well as those who have, opportunities of seeing the lady, will consider the Author as a brate.

Of one person he tells us, that ' he received the first rudiments of time, by turning over the leaves of the organ-book, above fifty years ago, at V. for Mr. G. then organist.'-Of another he says, that he should have omitted his name, if it had not concluded the alphabet; -and a third he pronounces to be 'a regularly sude, rugged, rough safper.'

Having given these specimens of the knowledge, candour, taste, feeling, politeness, and good-nature of this Abecedarian, we leave the Reader to estimate the value of his decisions in the other articles of his born-book, as it may very justly be called, though not so harmless a performance.

Art. 22. A Tour to the Caves, in the Environs of Ingleborough and Settle in Yorkshire-In a Letter to a Friend. 8vo. 1 s. Richardfon and Urquhart. 1780.

Given by way of Appendix to Mr. Weft's Guide to the Lakes; see Review, Vol. 59. p. 70. It does not appear that this Tour to the Caves is written by the Author of the Guide, &c. for the Dedication is subscribed with the initials J. H.

This Account of the Caves will not fail to excite the Reader's curiofity. Some of them are not less remarkable than the celebrated caverns in Derbyshire, which every body visits.

Art. 23. A Letter to the Rev. Mr. Madan. concerning the Chapter of Polygamy in his late Publication entitled CHELYPH-THONA. By a Layman, 8vo. 1s. Fielding and Walker, 1780.

The model Author professes his incompetency to hold a contention with Mr. Madan on the ground of critical learning. His object is, sorthrow fome information in the way of the plain and unlettered ; and to oppose, as far as lies in the power of an obscure citizen, the changeroes confequences that may anife from the publication of Mr. Madan's treatife. The Author's piety and good intentions will excuse the defects of this performance; and we fincerely recommend it to the perufat of those for whose we it was professely intended. - --- Hh 4-- -Art.

Art. 24. Remarks upon the eighth Section of the second Volume of Mr. Warton's History of English Poetry. 8vo. 1s. T. Payne. 1720. If any thing could tempt us to transgress that line of moderationa which inclination as well as duty marks out to us, it would be the petulance of such a writer as this. The manner in which he has attacked Mr. Warton, merely for differing from him in opinion on a matter of very trifling confequence, is equally rude and indecent. Had he been defending the validity of title-deeds to a family estate, he could scarcely have been more angry, or have treated his adversary with greater illiberality or infolence than he has poured out upon this worthy and learned Professor, for calling in question the authenticity of Rowlie's Poems.

We meet with little in this Writer's arguments that has not algeady been suggested by others who have treated the subject before, him. Our fentiments on this matter are well known; if there be any variation in them, it is, that the interpolations of Chatterton are not so

numerous as at first we suspected.

C . . t - t, Medical.

Art. 25. Practical Observations on the Treatment of Consumptions. By Samuel Foart Simmons, M. D. &c. 8vo. 2 s. Murray. 170.

In this performance the Author does not profess to give a systematical treatise on the subject; but confines himself to some general obfervations, relative to the symptoms and progress of the pulmonary confumption, and the remedies that have hitherto been the most commonly employed in the treatment of it: adding such other remarks as have occurred to him in the course of his own practice. We have in a former article noticed the fingular observation made by the Author, respecting the appearance of the teeth in this disease. This circumstance was first communicated to the Author by the learned Professor Camper. He supposes this appearance to attend every species of confumption; and the Author himself has, from repeated and attentive observations, been induced to think it is the distinguishing characteristic of a genuine phibisis, or of a pre-disposition to it. Of those, says the Author, who are carried off by this disease, the greater number will be found never to have had a carious tooth. phænomenon may serve to put us upon our guard, but ought not to make us despair of success. I have very lately seen a young gentleman recover, who had this transparency in a high degree, together with other symptoms of incipient phthisis.

The practical observations, with respect to the curative indications in the different periods of this disease, and to the remedies that have been proposed for the relief of it, are such as shew the Author to be a skilful and judicious observer; and accordingly merit the attention of practitioners, who cannot fail to receive with pleasure any new lights respecting a disorder so frequent and so satal as the pulmonary confumption.

Art. 26. An Account of the Life and Writings of the late Alexander Monro, Senior, M. D. F. R. S. Delivered at the Harveian Oration at Edinburgh, for the Year 1780. By Andrew Duncan, M. D. &c. &c. 8vo. 1 s. Edinburgh. Sold by Dilly in London. This biographical commemoration of a truly great man is a laud-

<sup>\*</sup> See Rev. for last month, p. 391.

able tribute of respect and gratitude, and will, we doubt not, be acceptable to the medical public. It would, however, have been more instructive and interesting, if the ingenious Writer had somewhat more particularly discussed the merits of the late Dr. Monro, as an improver of the theory and practice of medicine. This, indeed, would have required a larger compass; but without it, the piece scarcely answers to its title, as the Reader will probably be disappointed in his expectations from the account of the writings of the cebrated Prosessor.

A short and elegant 'Address to the Students of Medicine,' by Dr. Webster, on delivering the Harveian prize to Dr. Arthur Broughton, of Bristol, for his paper on the Coagulable Lymph, is subjoined.

Art. 27. Observations on the Means of preserving the Health of Soldiers; and of conducting Military Hospitals. And on the Diseases incident to Soldiers at the Time of Service; and on the same Diseases as they have appeared in London. By Donald Monro, M. D. Physician to his Majesty's Army, and to St. George's Hospital; Fellow of the Royal College of Physicians at London, and of the Royal Society. 8vo. 2 Vols. 10 s. Boards. Murray, &c. 1780.

In our Review for October 1766, an account was given of the first edition of this work, in one volume, then entitled An Account of the Discases which were most frequent in the British Military Hospitals in Girmany, &c. It now appears in so enlarged a form, that we think ourselves obliged to take notice of it as a new publication.

The Author has now divided his work into five parts. The first treats on the means of keeping soldiers healthy in different services and climates. The second contains very particular directions with respect to the sitting up and conducting military hospitals. In the third a short account is given of the health of the troops encamped at Coxheath in 1778 and 1779. The sourth, and most considerable part, consists of observations on the diseases prevalent in the military hospitals of Germany during the last war, and in the late camp hospitals in England. The sist is a pharmacopoeia for military use. The ciseases treated of in the sourth part are, putrid and petechial severs; the putrid fore throat; the dysentery; cholera morbus; inflammatory sever; inflammatory angina; pleurisy; peripneumony; cought and consumption; influenza; rheumatism; autumnal remitting sever; ague; jaundice; small-pox; scurvy; lues venerea; and some others.

It would occupy too much of our room and time to give an analysis of matter so various and extensive. We shall therefore only observe in general, that the work, in its present state, forms the most complete system of military medical practice we are acquainted with, and cannot fail of being peculiarly useful at this unhappy juncture.

cannot fail of being peculiarly useful at this unhappy juncture.

In a postscript are subjoined some remarks on Dr. Millar's Tables, so far as the returns of the German military hospitals form a part of them. And it seems clearly proved, that his misrepresentations, for the purpose of decrying the practice of others, were as flagrant as those by which he pussed off his own success. (See Monthly Review for August 1777.)

A

Art.

Art. 28. Free Observations on the Scurvy, Gout, Diet, and Remedy; &c. &c. By Francis Spilsbury, Chymist. 8vo. 2 s. 6 d. Wilkie. 1780.

We consess ourselves vanquished at last. Mr. Spilsbury has written so much beyond our powers of reading, that we cannot, in conscience, pretend to exercise our censorial authority upon him. Nay, so thoroughly are we humbled, that were he to appear before us with a book in one hand, and a bottle of his drops in the other, we should cry out with Lear,

If you have poison for me, I will drink it.

Art. 29. Histories of Gouty, Bilious, and Nervous Cases; with the sase and easy Means by which they were remedied; related by the Patients themselves, in sundry Letters to John Scot, M. D. 8vo. 6 d. Becket. 1780.

Without pretending to the spirit of prophecy, we may boast of a prediction very speedily and easily sulfilled. We ventured to foretel, that this writer's Enquiry into the Origin of the Gout, would prove the precursor of a nostrum; and lo! here it is. The pamphlet confiss of the most obliging and satisfactory testimonies to the merit of Dr. Scot's pills, from Capt. J. G. the Right Honourable Lord Blank, an Honourable Colonel of the same samily, Sir W. M. Bart. &c. &c. And our worthy publisher, Mr. Becket, promises to gratify any cu-zious enquirers at his shop with a sight of the originals of these important epistolary documents.

Art. 30. The Advancement of Arts, Manufactures, and Commerce; or, Descriptions of the useful Machines and Models contained in the Repository of the Society for the Encouragement of Arts, Manusactures, and Commerce. Illustrated by Designs on Fists Copper-plates. Vol. II. Carefully revised and corrected by Alexander Mabya Bailey. Folio. 21. 12 s. 6 d. sewed. Walter, &c.

MATHEMATICS, &c.

In the 47th volume of our Review, we gave an account of the first volume of this work, as published by Mr. William Bailey †, in the year 1772. In that Article, we sufficiently explained the defigu and plan of Mr. Bailey's undertaking. This second volume, published by Mr. Bailey junior, contains drawings, descriptions, and explanations of many new kinds of ploughs, with other implements of hashandry,—machines for improvements in manufactures,—mills, models, and other mechanic inventions.

RELIGIOUS.

Art. 31. A Letter to the Rev. Sir Harry Trelawny, Bart. A.B. occasioned by his Sermon preached at Taunton, May 26, 1779, before an Assembly of Protestant Dissenting Ministers. By Thomas Reader. 8vo. 6 d. Buckland. 1780.

When Sir Harry Trelawny first appeared on the spiritual theatre, the Methodists missook his enthusiasm for inspiration; and, in the insocication of their triumph for so rare an acquisition to the Tabernacle, they cried out, What bath the Lord wrange?

<sup>.</sup> See Review for June laft.

When the hurricane of his zeal was a little abated, and the wind had fet in to a calmer point of the compass, the Calvinistical Independents entertained the most sanguine hopes of establishing him amongst them as a found and regular brother. Hence he was ordained in form, and a wonder was expressed in public—not, that many wife, not that many noble, were not called, but—that any were!

Our Mr. Thomas Reader was one of those who thought very highly of Sir Harry's gifts and graces, at the time when he declared, with a truly orthodox zeal and affurance from our Author's pulpit, that "the Arians had ruised many once flourishing churches." though Mr. Reader had cast a sigure to determine the date of Antichrist's downfall, yet, he was not conjurer enough to foresee the apostacy of Sir Harry Trelawny/

## Quandoque bonus dermitat Homerus!

However, Mr. Reader was soon waked out of the slumber of falle The faints were fairly bit!—and so they were all faints and finners too-they were all bit! orthodoxy and herefy triumphed in their turns; and each, in turn, looked blank with chagrin and disappointment. Sir Harry's weather-cock is veering round, we are informed, to that quarter from whence its revolution first be-Whether (as Swift said of the capricious coquette who finished her giddy rambles in sober matrimony) he will rust to a point, and fix at last, is a matter we pretend not to be prophets enough to foretel. whatever Mr. Reader (on fecond thoughts) may be capable of deciding by the help of those spectacles which no one but himself can look through.

As for the Letter before us, we think a few extracts sufficient to give our Readers a pretty just idea of its merits:-and from them, too, a tolerably exact estimate may be formed of the state and condi-

tion of the Writer's bead and beart.

- 'I befeech you, by all the unknown tenderness of Immanuel's heart to finners, take care that those words may never be applicable to you, viz. who were of old forewritten to this condemnation (Jude 4.) -for all God's words will be accomplished, in whatever book they are written.'-Thus Sir Harry is awfully warned to take care of what it is impossible to avoid!

-' I am unacquainted with your friend the Rev. Mr. Towgood, who, it is faid, first led you into what is called the modern candour. That gentleman will, however, know, at the day of judgment, whether he befriended or injured the world, by the pains he took to modernize your ideas of eternal things.' . . . . The followers of Jesus ought, at least, to be certain, that the present assembly (viz. of the Differing ministers of Devon and Cornwall) is not a combination against the Godhead of Christ, before they attend it again, for this is the doctrine, flantis & cadentis Britannia.

Once more—'It gave me yet more pain to hear that you had joined in the solemn work of ordination with Dr. Priestley, whose Appeal to professors of religion, &c. shews him to be wholly unacquainted with the Gospel; and whose schemes of necessity and mategialism seem to flrike at the foundation of all religion.' . . . . Good God! when will this man cease to blaspheme Jesus and his Gospel?

The church of God hath no good to expect from those ministers

who can esteem Dr. Priestley as a minister of Christ.'

The greatest part of this Letter is in the same solemn strain of expossibilition and denunciation. One black and heavy cloud scowls over the whole.

Art. 32. Sermons on the most prevalent Vices, &c. By the Rev. David Lamont, Minister of Kirkpatrick-Durham, near Dumssies.

8vo. 6 s. bound. Crowder. 1780.

The subjects of these sermons are important, useful, and seasonable. The Writer has not all that engaging and winning manner which renders some productions of this kind peculiarly acceptable in these days of resiment, but the discourses are plain, serious, and sensible.

Beside two ordination sermons, and two on a suture state, mentioned in the title-page, the others are on the subjects which follow, and on each topic there are two discourses;—Against evil speaking; the debauchery of the heart; revenge; idolatry; covetousness; lying; swearing; drunkenness; pride; the violation of the sabbath; —and a synod sermon.

In the discourse against lying, the Preacher desends the proposition, that there are cases in which persons have no right to truth. He speaks guardedly on the subject, which is very prudent, — as the affertion may be extended so as to produce the most pernicious con-

fequences.

In one of the ordination fermons, we have the following characteristics of a good preacher: 'By a good preacher, I do not mean a man of noise and gesture, who preaches up himself and not his subject, and goes to the pulpit, as many go to the church, to be seen of men. The action of the theatre, and the bombast of romances, are unworthy of the pulpit, and disgrace its solemnity. But by a good preacher, I understand, a man, who, from his original good sense, improved by a good education, enters deep into the spirit of the facred text, speaks what he seels, and feels what is just; who, in his lectures, is clear and copious; in his sermons, accurate and persuafive; in both more attentive to sense than sound, to dignity of sensiment than lostiness of style; who manages his discourses with such propriety, that in each there is as much simplicity as will render it instructive to the vulgar, and as much sublimity as will render it acceptable to the refined.'

This is rational; but that circumflance will not recommend these discourses to the bulk of the people in this country, who greatly prefer the noise and ranting of our modern Enthusiasts, Methodists, and Mystics.

Art. 33. Hymns to the Supreme Being: in Imitation of the

Eastern Songs. 8vo. 3 s. 6 d. Boards. Nichols. 1780.

The volume opens with a paraphrase on the Lord's Prayer. We are next presented with hymns of adoration, particularly arising from a view of the Divine works and Providence; which subject affords the Author an opportunity of adding a variety of miscellaneous notes, chiefly relative to some curious particulars in natural history. We have also Hymns of Thanksgiving and Gratitude,—of Penitence, and of Supplication for blessings private and public. The expressions

 $H \cdot$ 

are generally those of Scripture, or such as are conformable to Scripture language, and the Eastern style. The Author observes, that fome of them were adapted to particular circumstances of his own life, and may, therefore, be little interesting to others; yet he thinks they may possibly be useful when in a situation any way similar.

The tendency of these hymns (none of which are in verse) is to elevate the mind to piety and virtue. In a devotional view, without doubt, they will be very acceptable to many Readers.

#### R M O N S E

I. Against Persecution: Preached at Houghton-le-Spring, July 16, 1780. By John Rotheram, M. A. Rector of Houghton-le-Spring, Vicar of Seaham; and Chaplain to the Right Rev. the Lord Bishop of Durham. 8vo. 6 d. Robson, &c.

This good sermon appears to have been occasioned by the late riots in London, and other parts of the kingdom. Mr. R. paints, in lively colours, the horrid and impious nature of the spirit of intolerance and perfecution; a spirit totally opposite to the genius of true Christianity,—to both the precepts and example of its divine Author; whose memorable reproof to his disciples-" Ye know not what manner of spirit ye are of"-furnishes an excellent text for this difcourfe.

II. Preached at the Parish Church of Greenwich in Kent, Feb. 4th, 1780, being the Day appointed for a General Fast. By Edward Birkett, Clerk, Curate of the said Parish. 4to. 1 s. Robinson. This discourse confists of some pious restections on Hexekiab's prayer to the Lord, when the army of Sennacherib, the Assyrian monarch, invested the city of lerusalem, and menaced its inhabitants with a terrible flaughter. The Author adverts also to their miraculous deliverance, and speaks of the advantage of prayer and dependence on Almighty power in the day of danger and diffress. These reflections are applied to the present situation of our country; and while the Preacher founds the alarm, he points to the best means for fecurity.

III. Preached before the Governors of the Devonshire Hospital, at their Anniversary Meeting in 1780, at the Cathedral, Exeter. By John Marshall, A. M. Vicar of Widecombe, and Master of the Grammar-school in Exeter. 410. 1 s. Printed for Thorn, Exon.

This discourse is on the subject of Charity; a subject so trite and common, that it is scarcely in the power of genius itself to advance any thing new or original on it. The text is taken from the 37th verse of the 10th chapter of Luke. The subject is well illustrated and enforced, and bespeaks the Author a man of sense and benevolence.

Mr. Marshall places the Priest and the Levite in the most candid point of view, and endeavours to apologize for their conduct from the contracted principles of the Jewish occonomy. He thence very pertinently draws a conclusion in favour of the more enlarged and unrestrictive

The art of the Control of the Contro

:

unrestrictive benevolence recommended by the amiable example of Christ, and enforced by the motives of his dispensation. In opposicion to Lord Shaftelbury, he remarks, that private friendship is included in the more extensive connections recommended by our Saviour; and in the conclusion very properly speaks of the excellence of that institution which it was the design of the assembly he was addreffing to support and extend.

IV. Preached in the Parish Church of Whitby, July 2d, 1780, be-fore a Battalion of Volunteers, formed for the Defence of that Town and Neighbourhood. By the Rev. Joseph Robertson, Garate of the

faid Church. 4to. 6d. Baldwin, &c.

Very properly adapted to the occasion, by a lively exhortation of the audience to exercions of valour, and exertions of virtue.

V. The Wisdom of appointing and Supporting the Civil Magistrate: at the Chapel-Royal, St. James's, Jene 25, 1780. By Robert Markham, D.D. Rector of St. Mary's Whitechapel, and Chaplain in

Ordinary to his Majesty. 4to. 1 s. Rivington. Few, if any, will dispute the necessity and advantage of government to the peace and welfare of fociety: nor will they generally deny the obligation of submitting to its just and reasonable orders. So far then Dr. Markham is well supported: nor do we perceive that he pleads in favour of government any farther than as it tends to secure "the public peace and welfare, with that of every individual; the only end, as common sense will dictate, for which we can suppose magistrates, supreme or subordinate; to be appointed.

VI. Christian Zeal recommended and enforced—before the Contributors

to the Salop Infirmary, at their anniversary Meeting, in the Parish Church of St. Chad. Shrewbury, September 14, 1780. By the "Rev. Brian Hill, A. B. of Queen's College, Oxford; and Chap-

lain to the Earl of Leven. 8vo. 6 d. Robinson, &c.

The Preacher appears to be bemself scaleufly affected, and recom-"mends, with ardour, PIRTY and GOOD WORKS. In one part of his discourse, he exhorts to a zeal in support of some points of genuted - wee Bodesty, concerning which sensible and pious Christians entercain wery different ideas. Here he may possibly err; but when he exhorts ins, in a plain and fervent manner, to a diligent and conftant care, To to act in the present dife :as to be ready to leave it with peace and hope, - and when he urges a chearful contribution to the charitable institution in favour of which his discourse was delivered,-there, we apprehend, he cannot be missken.

VII. Preached in the Cathedral at York, July 30, 1780, at the Affizes. By Nicholas Torre, M. A. Follow of Trinity College,

Cambridge. 4to. 1 s. Baldwin. 1780.

In this elegant harangue on justice and judgment, the Preacher la-" ments the late alarming tumults, "which, he fays, wore the mask of religion, yet concealed beneath it hypocrify and rebellion.' fures us, that the 'Papal authority is now so enseebled, so disarmed "of its terrors, that the extension of its influence is no longer to be " dreaded.' Others are of opinion, that the principles of Popers have always the same tendency to disquiet and oppress mankind; and . therefore, that while every provision is to be made, for the lafety and comfort comfort of individuals among the Papists, it is wife and reasonable to do it under some restrictions. However this be, we never yet could admit the thought, that any zeal for religion really occasioned the horrid devastations to which this discourse alludes.

VIII. The Duty of Patriotism vindicated and enforced: in the Cathedral Church of Ely. By Catar Morgan, M. A. Minor Canon, and Preacher in that Church, and late Pellow of Christ College,

Cambridge, 4to. 1 s. Cadell, &c. 1780.

An ingenious and fensible harangue, recommending an attention to the present distress of our country, in some, by retrenching expences, or by pecuniary aids, and in all persons by repentance and amendment of life. As to pecuniary aids, it may, perhaps, be doubted, whether the people are not generally too little satisfied about the vast sums which have been already lavished, to be very sorward in voluntary contributions.

IX. At St. Paul's, Covent-Garden, June 11, 1780. By James
Howell, M. A. Student of Christ Church, Oxford. 4to. 12.
Robfon, &c.

Offers very good advice, though in somewhat of an odd and irregular manner. But, if the parishioners of Covent-Garden, or any other parishioners, will heartily sollow the Preacher's admonitions, it will no doubt be productive of salutary effects.

## CORRESPONDENCE.

To the Editor of the Monthly Review.

N the very excellent criticism which is given, in your Work, upon Mr. Madan's Thelyphthora, some notice is taken of that writer's appeal, in favour of his doctrine, to the authority of Bishop Burnet. But as your ingenious and learned Reviewer doth not feem to have been acquainted with the whole of the case in regard to the Biffiop, perhaps you will indulge me, as a Correspondent, in stating the matter a little more parcicularly. Burnet's paper, which Mr. Matlan has inserted in his treatise, was written on the following occasion. About the year 1670, or 1671, the Earl of Laudeidale discovered to Dr. Burnet the secret of the Duke of York's religion, and perceiving him to be exceedingly firuck with the apprehensions of the return of Popery into the kingdom, hinted to him a project of King Charles the Second's divorce, that, by his Majesty's marrying again, he might have an heir to the crown; and thus prevent his brother's faceceding to it. Upon this the Doctor, who was then only twenty-seven years of age, and full of the civil law, which had been his fift study, mentioned several philages out of the Digests, Code, and Novels, that favoured the Earl's idea. His Lordship defired him to state the matter in writing, which he did; saying, at the same time, that he spoke of the sudden, but that when he went home among his books, he would examine the affair more closely. Accordingly, in the winter following, he wrote to the Earl of Landerdale, retracting the whole paper. Nor did he barely retract is, but answered and consuted the most material things which he had before advanced. If we look, also, into Dr. Burnet's account of the life and death of the Earl of Rochester, we shall there find him expressly condemning both the doctrine of polygamy and divorce. Thus it appears, that what is considered as Bishop Burnet's authority, was only an opinion hastily adopted by him when a very young man, speedily and solemnly renounced, and which he never afterwards maintained. For the proofs of what I have alleged, I refer to the Bishop's reslections upon Dr. Hickes's Discourses, to his article in the Great General Discionary. Note M. and to his article in the Biographia Britannica, Note PP. I shall only add, that Dr. Burnet's paper, though given by Mr. Madan from the British Museum, is not now first published; having been printed in the year 1733, at the end of Macky's Memoirs.

Westminster,
Dec. 23, 1780.

I am, Sir,
Your most humble servant,
AND. KIPPIS.

The letter figned 'A Polygamist,' controverting the criticism on Thelyphthora, given in the Monthly Review, has been forwarded to the Author of that criticism [now at a great distance from the capital]; from whom no answer could be received, time enough for any farther notice of this Correspondent's objections, in the present Month's Review.

††† The Editor has received a letter, dated Tamworth, in Staffordfhire, and figned Eliza Malkin,—relating to the prices of books, as
commonly inferted at the head of each Article in the Review.—Mrs.
Malkin (if that be our Correspondent's real name) complains, that
fometimes she does not understand, precisely, what is meant by the
distinctions of anbound,—in sheets,—in boards, &c.—These are
matters with which the Reviewers have little concern. They are lest
to the Collector, who (it is understood) generally takes them from the
news-paper advertisements, and in the very terms there used: and
where those vehicles of information are silent with regard to the price
of any publication, the desciency is always supplied by inquiry of
the publisher.—As to the list of books, subjoined, by way of Postscript, to Mrs. Malkin's letter, and of which she desires to know the
prices, "neatly bound in calf, and well letter'd,"—the isquiry is improperly addressed: it should be made at the shops of the Bookssellers,
particularly those for whom the Articles are printed, or where they
are advertised for sale.—And this the country Booksellers can readily
do, when writing to their correspondents in town.

• .• H. P — 'wonders' that we have 'overlook'd' a little tract, entitled, A Differtation on Scripture Imprecations, by Benjamin Williams. Our Collector can find no such publication; nor have we ever seen it advertised.

Rev. Cofine is misprinked: T. Cofite.

P. A13. In the Title of Dunbers Spays, for un cultivated, T. Cultivated.

#### I. ART.

OMHPOY YMNOE EIE AHMHTPAN: vel, Homeri Hymnus ad Cererem, 700 1/2. nunc primum editus à Davide Ruhnkenio. Lugduni Batav. apud Sam. et Joann. Lutchtmans. 8vo. [pages 63.] 1780.

THE discovery of this ancient and truly beautiful Greek poem was no less singular than interesting; and the admirers of classic lore will think themselves under great obligations to the learned and ingenious Editor, for the pains he hath taken to gratify their curiofity; -not only by an elegant edition of the poem itself, but by his very valuable Notes and Observations, which tend to illustrate its beauties, and to throw a light on some of its obscurities.

The Editor's Preface, though not written on the purest model of classical elegance, contains many striking and beautiful passages, even in point of language and composition: but it hath still a much higher merit: it is fensible, modest, and highly satisfactory to the curious Reader.

We shall give the substance of it; referring the learned, who

may wish for more ample satisfaction, to the original.

The Editor informs us, that nothing was more distant from his expectations than the discovery of this Hymn to Ceres. He knew, indeed, that a poem, bearing that title, and ascribed to Homer, existed in the second century; [altero à C. N. seculo superfuisse sciebam] but as it had long been considered as irretrievably loft, he had formed no hopes of ever seeing it rescued from the obscurity to which it had been consigned:—at least (as he modefily fays) he could not have flattered himself, that on a discovery of so unexpected a treasure, the charge of presenting it to the Public would have been entrusted with him. : App. Rev. Vol. lxiii. The The circumstances of this discovery are related by the Editor; though at first hearing it might surprise any one to be informed, that a Greek poem, attributed to Homer, which had been lost for ages, was at length discovered in Musewy. Such a relation would appear to savour more of fiction and raillery, than of sober truth. [Si quis narrasset, omnes eum jocari potius, quam seriò loqui, putassent.] But so in fact it was: and the rudest and most unclassical country in Europe hath the honour of having preserved from final perdition this curious and most beautiful remnant of antiquity.

For the satisfaction of our Readers, it is necessary to mention the most interesting particulars that relate to this singular

and valuable discovery.

' Some years fince, a German, Christian Frederic Matthæi, who had been educated by the learned Ernesti, and credited the discipline of that celebrated master, by his skill and enudition, was invited to settle at Moscow, and to affist in a plan of literature for which his abilities and acquirements, most eminently qualified him. On his arrival at that city, he was informed, equally to his aftonishment and satisfaction, that a very copious treasure of Greek MSS. was deposited in the Library of the Holy Synod [in Bibliotheca S. Synodi] which no person in that country had either the abilities to make use of, or the curiofity to examine. Struck with the relation of a circumstance so unexpected, and at the same time so peculiarly flattering to the taste of this learned man, he immediately feized the opportunity that was luckily offered him, to explore this repository of hidden treasure. After having examined feveral curious books (of which an account will be given in due time), he discovered a manuscript copy of the Works of Homer, written about the conclusion of the 14th century, but evidently a transcript from a very ancient and most valuable copy, which, besides the Iliad and the Odoffer, contains also sixteen of the Hymns, which have been long published under the name of Homer. But this was not all. Twelve lines of a lost Hymn to Bacchus (published at the conclusion of the present work) and the HYMN TO CERES (which, excepting a few lines towards the close, appears to be entire) were proferred in this curious and long unnoticed manuscript. Exulting, as indeed he well might, in an acquisition so unexpected, and, at the same time, so valuable, the learned discoverer, with fingular difinterestedness, communicated it to our Editor, that he might present it to the world without those delays, which would, in all probability, have retarded the publication of it at Moscow.

Matthæi, indeed, was well acquainted with the talents and extraordinary erudition of Ruhnkenius; and as he knew too that his learned friend had been particularly engaged in the fludy of the Hymns of Homer, in order to give the Public a complete

Plete edition of them, he could not have entrusted this poem to the charge of a person more qualified to do justice to its publication than our Editor: and we can truly say, that he hath not dishonoured the trust reposed in him, nor frustrated the expectations of his most sanguine admirers.

With this Hymn, many various readings, tending to illustrate and explain some obscure passages in those already published, were also communicated to Ruhnkenius; the use and

importance of which will be feen in their proper place.

The Editor observes, that as there was only one copy of this Hymn to Ceres, to which he could have recourse, he was frequently obliged to call in the aid of conjecture, in order to determine the reading, or guess at the sense, of some obscure passages. [Ad ingenium, codicis vicarium, confugi.] And when an Editor makes so good a use of his ingenuity as Ruhnkenius, the most scrupulous and sastidious critic will scarcely be disposed to find fault with him.

The Editor declines the hazardous task of translation. We are sorry, that his scruples on this head should have deprived us of a pleasure, which we are sure he could have given us by a Latin version of this Hymn. It is certain, that translations have been (as our Editor says) the source of contentions; and we may add, that they have frequently been made the resuge of indolence. Nevertheless, they have their peculiar uses; and we hope ere long to see a translation of this poem executed with correctness and taste by some learned and ingenious hand. Such a translation would ensure its own success; and would be equally acceptable to the learned, as to those who are incapable of reading the poem with ease and sluency in the original.

Having given a general account of the discovery of this Hymn to Ceres, the Editor examines with what propriety it

may lay claim to the Muse of Homer for its birth.

Pausanias, it is observed, hath asserted more than once, and that not accidentally, but by design, that Homer had written such a hymn: and the old Scholiast on the Alexipharmics of Nicander speaks of hymns that were attributed to Homer, in which a circumstance relating to Ceres is mentioned. But this hymn records no such circumstance; and therefore the Editor conjectures, that the critic, through forgetfulness or inadvertence, mistook Homer for Orpheus: or else, he must have seen another hymn ascribed to Homer different from the present. As to Pausanias, our Editor hints, that his judgment with respect to the subject of Homer's Hymns is not to be implicitly followed. He allows this writer great merit, as a critic; but thinks, that the splendor of the subject too much dazzled his understanding to permit him to decide with impartiality.

The Editor acknowledgeth, that he hath not one, but many doubts, with respect to the high and illustrious origin ascribed to this Hymn: but as no positive external evidence can be produced to determine the point, he chuses to rest his argument on, what appears to him, the more certain ground of internal proof: and observes, that though it be exquisitely beautiful, yet that it is evidently deficient in some of Homer's more striking and predominant characteristics. It wants his energy and spirit:that vigour, that inspiration which animates and gives an irrefistible power, as well as an enchanting beauty, to the poems of that sublime and inimitable bard.

This opinion hath been given by other critics on all the hymns ascribed to Homer. An ancient Greek writer, quoted by Allatius (de Patria Homeri, cap. 15.), asserts positively, that nothing is to be esteemed as the genuine production of Homer, but his Iliad and Odyssey: and as for the Hymns, and other things which bear his name, they are to be regarded as spurious, for, fays he, they are destitute of force, and not consistent with

nature.

The Editor of this Hymn, though by no means disposed to attribute it to Homer, yet acknowledges, that the structure of ' its language is founded throughout on the model of that ancient poet [Forma dicendi, fateor, tota est Homerica]; -though he produces some striking exceptions to this general affertion:too general (we think) and unguarded; and liable to more ex-

ceptions than the ingenious Editor hath specified.

But though this poem be dispossessed of the claim ascribed to it in the old manuscript at Moscow, viz. as the production of Homer, yet the Editor hesitates not to give it the honour of very high antiquity. He is of opinion, that it was written immediately after Homer; or at least in the age of Hesiod. [A peëta, qui vel statim post Homerum, vel Hesiedi ætate vixerit, scriptum videatur.] The χνες αρχαιοπινης—the venerable wrinkles of hoary age are deeply marked on the very face of it. This will be visible to all that are skilled in the Greek classics. Such will perceive, and as it were feel, its antiquity, by a fensation that cannot be communicated or explained to the reader who hath not been particularly conversant in these studies, or (to express our meaning in the strong language of Shakspeare) native and endued to them, as their own element. [Hoc à peritis sentiri potest, imperitis, quid sit, explicari non potest.]

The Editor congratulates the age on the discovery of this curious poem-rescued by mere accident from the darkest retreats of oblivion; and, perhaps, but at a slight distance from inevitable perdition.—He deems it to be an acquisition, not only calculated to gratify the curiofity of the connoisseurs in classic antiquity, or to entertain those lovers of Greek poetry

whose studies are made subservient to a refined and elegant species of amusement; but he also esteems it as of particular use to the critic, as it tends to illustrate some obscure passages both in the Greek and Latin poets. To evince its utility in this view, the Editor refers to three examples which spontaneously offered themselves, without any particular search for the purpose of finding out instances to prove his affertion.

The first is from Catullus, de Nupt. Pel. & Thet. 281.

- quos propter fluminis undas Aura parit flores tepidi fecunda Favonî, Hos indistinctis plexos tulit ipse corollis Queis permulfa domus jucundo RISIT odore.

Vulpius censures the metaphor in the last line, and says, that it is too far fetched." [longius petitum.] But the learned Editor produces a passage from the beginning of this hymn, as the source from whence this mode of expression was derived. [Ecce fontem unde venustum illud loquendi genus fluxerit, in bymne ποstro, vers. 13.] Κηωδει δ' οδμή πας δ' αρανος ευρυς υπερθεν

Γαια τι τας ΕΓΕΛΑΣΣΕ και άλμυρον οιδμα θαλακτης. The wide circuit of Heaven above, all Earth below, and the swell of Ocean's briny wave, laughed [i. e. were cheared or refreshed] with the delicious odour of the Narcissus,

It is, however, by no means clear to us, that Catullus borrowed either the thought or the expression from this poems Metaphors of the same import, and equally bold, and, as some would call them, unwarrantable and far-fetched, may be found in almost all the ancient poets. As to this particular metaphor. it may be traced up to

> - Siloa's brook that flow'd Fast by the oracle of God -

as well as to the less hallowed fountain of Hippocrene. Several examples of a fimilar mode of expression will readily occur to those who have been conversant with the Holy Scriptures, and particularly the Psalms of David.

A hasty critic, in his eagerness to trace out the origin of a poet's idea, might have been ready to have charged Milton with borrowing one of the most admired passages of the Paradise Lost. from the lines just quoted, if the Hymn to Ceres had been published in his day.

> oft at fea, North-east winds blow Sabæan odour, from the spicy shore Of Araby, the Bleft .

- and many a league

Chear'd with the grateful fmell, old Ocean SMILES. B. IV. Laughter is here most elegantly softened into a smile; else the last line is almost a literal translation of

Knudes

Knudei d' odun ----

- εγελασσε και άλμυρον οιδμα θαλασσης.

The Editor closes his Preface with observing, that, content with the honour of publishing this Hymn, he leaves the farther comparison of it with the other poets of antiquity, for the sake of mutual illustration, to the skill and industry of other critics.

It will be expected by our Readers, that we should give some account of the Hymn itself; and we know not how we can more effectually gratify them, than by presenting them with the general scope and argument of it; reserving our remarks on some of its more striking and beautiful passages, together with an extract from the original, by way of specimen, for the close of this Article.

## A general View of the HYMN TO CERES.

. The Poet first recites the manner in which Proferpine was carried off by Pluto, as the was innocently indulging herfelf, with the daughters of Oceanus, in gathering flowers of various kinds, in the meads of Nysia. As she plucked, with eager hands, a beautiful Narciffus (produced by Jove's own decree on purpose to entice her), the earth instantly opened in the delufive spot, and Pluto rushing forth, seized the helpless virgin, and hurried her away, regardless of her cries, to his gloomy palace in hell. Ceres, though she hears her daughter's voice, is ignorant of the cause of her distress. To gain some intelligence respecting her sate, the goddess wanders about for nine days, in a state of wild distraction. On the tenth she meets Hecate, who informs her that she also heard the cries of Proferpine, but was not certain who her ravisher was. This unsatisfactory account serves but to aggravate the distress, and increase the apprehensions of Ceres. Mingled anxiety and indignation could find no utterance in words. She makes no refate of her daughter. Approaching his flaming chariot, the claimed that respect which was due to her rank among the immortals. The chariot stops, and she hath audience of Sol, to whom the relates the cause of her errand, and solicits him to inform her where the might find her daughter, and whether the had been bereaved of her by any one of divine, or human race. Sol informs her, that Pluto was the ravisher; and, by the counsel of Jove, had married Proferpine, and carried her to his gloomy palace. In order to assuage the grief, and soften the indigna-tion of the goddess, he urges the distinguished rank that Pluto held among the immortals; but this doth not reconcile her to the loss of her daughter; she continues relentless, and particularly conceives a severe resentment against the Father of the Gods, for having counselled Pluto to carry off her daughter. With mingled indignation

indignation and anxiety, the separates herself from the affembly of the immortals, leaves Olympus, and descends to earth, in order to indulge her forrow among men. Affuming the form of a woman advanced in years, disguised in the habit of a nurse, and passing under the seigned name of Doris, she meets the daughters of Celeus Prince of Eleusis, who, with their urns of polished brass, were going to draw \* water from a fountain near the spot. To them she relates a fictitious story of her adventure with a crew of pirates, who had taken her, as the pretended, in order to fell her for a flave; but having made her escape from them whilst they were regaling themselves at supper on the shore, she had strayed to the place where she then She calls herself a forlorn wanderer, among strange people, and in an unknown region; implores their compassion; and folicits some menial employment in their house, to preserve her from perishing through want. They are affected with her story, and hasten home to give an account of the distressed stranger to their mother Metanira. On the recital of it, she orders them instantly to return, and bring the woman to her house, as the intended to employ her in the quality of a nurse to her fon. The daughters, with eager joy, run to execute the commands of their parent; and finding the disconsolate stranger fitting by the highway-fide, they deliver the message they were charged with, and gladly conduct her to the house of Celeus.

As Ceres enters the porch, the whole structure is illumined with an extraordinary radiance, betokening the approach of a goddess. Metanira herself feels an inexplicable impression of awe and reverence, and, rising with a deference due to a superior being, offers her feat to the unknown guest. Ceres modestly refuses the honour, and looking on the ground, as if unconscious of her dignity, the remains filent, in a state of delicate confufion. At last, when seated, Metanira relates to her the extraordinary bleffing of the gods, in giving her a fon (the darling and fond hope of the house of Celeus), at a period of life when human nature could have formed no expectation of so singular a favour. As the outward appearance of Ceres favoured her fuit to the daughters to be employed in some domestic concern, where the caution of mature years was requisite, Metanira is defirous to commit to her care this darling child; and to encourage her to undertake the charge, and at the same time to engage her to tenderness and sidelity, she assures her, that if her fon should live, he would have it in his power to repay her tenderness and care to the utmost extent of her wishes. Ceres readily accepts the charge, and engages to protect the child from the evils

<sup>\*</sup> An employment not beneath the daughters of persons of rank in the ages of primitive simplicity. Vid. Gen. xxiv. 15. Exod. ii. 16. Ii4

of malignant incantation, and all the mischiefs which arise from unskilful nurses. Demophon (for that is the name of the royal infant) flourishes with most astonishing quickness under the care of Ceres; for nursed by a goddess, he is treated like a child of the gods. He is anointed with ambrofia, and refined by fire, that he might acquire an immortal substance. All this was transacted in private, nor were his parents conscious of the honour that was intended for their son. But Metanira, impelled by the foolish curiosity that hath been proverbially incident to her fex, watches to fee in what manner her child is treated; and observing him thrust into the fire by his nurse, her natural feelings are awakened, and she alarms the whole house with her loud and bitter exclamations. The goddess is highly provoked at this intrusion and frantic behaviour of the mother of Demophon, and hastily snatching the child from the mystic fire, that was prepared to endue him with the powers of divinity, she laments the precipitance of mortals, and their blindness to approaching fate, whether good or ill; and then addressing Metanira, the goddess informs her, that her rashness and folly had rendered her purposes towards the child for ever abortive; - that the immortal substance into which he was pasting, under the operations of her divine power, could not now be perfected;—and that, brought back to the flate of mortals, he must share their fate. Nevertheless, she affures Metanira, that her fon's honour would be incorruptible, though his body would perish, because, nursed in the bosom of a goddess, he had imbibed some qualities of a divine principle. After having foretold a civil war amongst the Eleusinians, Ceres announces her divinity, and, dropping the form she had assumed, breaks forth into all the radiance of an immortal being, diffusing around her the odours of a goddess. Metanira is overwhelmed with astonishment and horror. Her daughters hearing her cries, hasten to her affistance, and find the child cast on the ground. divide their attention between him and their mother; till discovering the cause of the confusion, they are struck with awe and dread, and employ the whole night in efforts to appeale the incensed goddess.

In the morning Celeus becomes acquainted with all the circumstances of this strange event: on this he consults the most distinguished and experienced persons in the country, as to the most proper means of appeasing Ceres. By their counsel, he orders a temple to be erected, and an altar consecrated to the goddess. This being accomplished, Ceres vouchsases to make it her residence, in a total separation from the society of the gods. Here she indulgeth herself in deep distress for the loss of her daughter, and meditates revenge on the author of her calamity. She makes the earth barren for a whole year, and thus restraining

restraining its sertility, the gods are deprived of their wonted offerings. Jupiter revolving in his mind the fatal consequences of Ceres' revenge, if the should obstinately perfist in her resolution to deprive the earth of its accustomed produce, dispatches Iris to soften her resentment, and invite her to resume her seat But Ceres is inflexible. among the immortals. gods are sent to the temple of Eleusis, to mediate between the goddess and Jupiter; but not one could effect the purpose of their meffage; and she declares that she will never ascend Olympus, till she beholds her beautiful daughter. On this Tupiter dispatches Mercury to Pluto, to inform him of the distraction of Ceres, and her fatal resolution, and to solicit him to yield up Proferpine, that he might carry her to her mother. His eloquence fooths the grim monarch of hell into compliance. Pluto endeavours to fix in her mind a deep impression of his authority, in order to engage her to return, and be reconciled to her connection with him. He promises her high honours among the immortals, and the fatisfaction of feeing those punished for ever, who should impiously deny her those oblations which were her appointed tribute. After he had given her a part of a pomegranate, to secure her return, he prepares his golden chariot, and feating Proferpine in it, Mercury performs the office of charioteer, and rapidly conveys her to the temple of Eleusis, where Ceres once more beholds her daughter with rapture; and rusheth forward, as she approaches the temple, to embrace her in her arms. After these endearments, Proserpine relates to her mother the circumstances of her ravishment; enumerates her companions when it happened, and their amusements in the fields. In the midst of their conversation, Hecate approaches and joins them. After this, Jupiter sends Rhea, the mother of Ceres, to invite her to mix again with the celestials, engaging, on her consent, to permit Proserpine to divide the year between Erebus and Olympus;—fix months to refide with Pluto, and the remaining fix with Ceres and the other immortals. The goddess is delighted with the presence of her mother; her resentment yields to parental authority and entreaties; she consents to the decision of Jupiter; and revoking her resolution, the earth resumes its usual fertility, and the gods have their offerings reftored. Then, having given such instructions as were proper for the direction of her votaries at Eleusis. in the celebration of her facred rites, the ascends Olympus, and joins the gods.

In the Conclusion, the Poet invokes Ceres and Proserpine, and solicits them to accept his Hymn, and reward the Author

with a pleasant life.

We have thus given a general view of this ancient and curious hymn; which, though it will by no means fatisfy the lovers

lovers of Greek poetry, may have the effect we delire, and that is, to engage them to perule the whole in its original and infi-

nitely more beautiful state.

We shall select a passage or two from the poem itself, which particularly struck us for its exquisite merit; and from them the learned reader may form some judgment of the skyle and manner of the ancient Bard.

When Ceres approached the threshold of Celeus's palace, though under the disguise of a nurse, every object around her seemed to consess the person of a deity. Metanira selt an inessable impression of reverence and awe, and arose to offer her splendid seat to the stranger. This circumstance is beautifully expressed by the Poet.

Την δ' αι επ' μόση εβη ποσι. και ρα μελαθρα Κυρε καρη. πλησεν δε θυρας σελαος θειοιο. Την δ' αιδως τε, σεβας τε, ίδε χλωρον δεος ειλεν. Ειζε δε οι κλισμοιο, και έδριαασθαι ανωγεν.

The goddess modestly waved the distinction, as unsuitable to the appearance she had adopted to veil her divinity; and stood (as the Poet says) 's filent; fixing her beauteous eyes on the ground.'

Αλλ' ε' Δημητηρ ωρηφορος, εγλαοδωρω, Ηθελεν εδριαασθαι επι κλισμοιο φαεινε,

Αλλ' ακευσα εμιμνε, καί ομματα καλα βαλυσα.

The Poet finely describes the circumstance, mentioned in our general account of this Hymn, viz. of the goddess's resuming her original splendor when Metanira intruded on her secret operations, as she was preparing the child for immortality.

Ειμι δε Δημητηρ τιμαοχος, η τε μεγιςου Αθανατοις Эνητοισι τ' οπειαρ και χαρμα τετυπται. Αλλ' αγε, μει νησν τε μεγαν, και βωμον υπ' αυτυ, Τευχοντων πας δημος υπαι πολιν, αιπυ τε τεεχω, Καλλιχορε καθυπερθεν, επι πρεχοντι κολωνω. Οργια δ' αυτη εγων υποθησομαι, ως αν επειτα, Ευαγεως ερδοντες, εμου νοσν ιλασκοισθε. Ως ειπυσα θεα, μεγεθω και ειδος αμειψε, Γηρας απωσαμενη. περι τ' αμφι τε καλλος αητο, Οδμη δ' ίμεροεσσα Эυηειτων απο πεπλων Σκιδνατο, τηλε δε φείγω απο χροςς αθανατοιο Λαμπε Θεης, Κανθαι δε κομαι κατενηνοθεν ωμες, Ανγης δ' επλησθη πυκικω δομω, ας εροπης ως.

The following translation may convey to our less learned Readers some faint idea of the beauties of the original:

I am Ceres; and claim my right to the highest honours, since I yield delight and profit both to mortal and immortal beings.

<sup>\*</sup> Signa dedi venisse doum, &c. Vid. Qvid. Metam. lib. i. ver. 220.

Go—let all the people unite in erediing for me a spacious temple on Callicborus's o'erbanging mount. Raise my altar beneath its stately roof. This I ordain; that those who sacrifice to me with pure hearts may enjoy the tribute of my acceptance. Thus spake the goddess: when the form she had assumed of wrinkled age instantly disappeared; and all her native heauty shed its charms around her. From her incensed dropping robes a delicious fragrance was dissued. Light streamed afar from her radiant and immortal form. Her golden locks slowed around be beauteous shoulders: while the splendor of the goddess, darting like the lightning of heaven, irradiated the gloomy palace.

Our classical Readers will doubtless recollect the elegant lines of Virgil (respecting the discovery of Venus by Æneas), which, however, are by no means equal to those of the Greek Poet for

dignity and force:

Dixit: et avertens rosea cervice refussit, Ambrosizque comz divinum vertice odorem Spiravere: pedes vettis dessuit ad imos; Et vera incessu patuit des.

The last specimen that we shall give of this poem, is the description of Mercury's conveying Proserpine to the temple of Ceres.

Ιππες δε προπαροίδεν υπο χρυσεοίσιν οχεσφε Εντυεν αθαναίας πολυσημαντωρ Αιδωνευς.
Ηδ΄ οχεων επεβη, παρα δε κρατυφ Αργειφοντης, Ειμφα δε μακρα κελευθα διηνυσαν: αδε βαλασσα, Ουθ΄ υδωρ ποταμων, ατ΄ αχκεα ποιπευτα, Ιππων αθαναίων, ατ΄ αχκεα ποιπευτα, Αλλ΄ υπερ αυταων βαθων περα τεμνον ιοντες.
Στησε δ΄ αγων, οθι μμνεν ευςεφανώ Δημηταρ, Αλλ΄ υπερ αυταων βαθων περα τεμνον ιοντες.
Στησε δ΄ αγων, οθι μμνεν ευςεφανώ Δημηταρ, Νησιο προπαροίθε θυωδεώ. η δε ιδασα
Ηιξ΄ ηυτε \* μαινας ορώ κατα δασκιον υλης.

Of which the following is a translation, chiefly deligned to

gratify the English Reader:

Pluto, the monarch of a vast dominion, led forth, to open view, bis immortal steeds, and barnessed them to his golden chariots. Proferpine ascends, and takes ber seat. Mercury, the dauntless hero, who sent Argus to the shades, grasps the reins in his steady hand, and waves his lash. Instant they rush from Pluto's drear abode, and unreluctant urge their rapid course. Soon they pass o'er a long extended track. Nor seas, nor torrents, nor the deep vallies silled with herbage, nor mountains raising their losty heads, impede their progress. Through mid air they cut their way, nor stack their ardour till they arrive at Ceres' temple, fragrant with incense. There, when the goddess beheld her daughter, she rushed towards her, with the swiftness of a hind, bounding o'er the shady summits of the mountain.

<sup>\*</sup> Lege potins kuppas.

We have already observed that this poem is enriched with a number of very learned Notes; in which the Editor hath discovered a most perfect acquaintance with the Greek Poets, and a happy talent at emendation and conjecture. We must now quit this pleasing subject, and leave our learned Readers to improve these imperfect hints.

(N. B. We are indebted to "A Country Correspondent" for the foregoing very curious Article.)

## ART. II.

Reussian Juge de Jean Jacques, &c.—Rousseau the Judge of Jean Jacques. In Dialogues. Dialogue the First: From the Manuscript of M. Rousseau, lest in the Hands of Mr. Brooke Boothby. 8vo. 6 s. Boards. Dodsley. 1780.

different from that mentioned by Mr. Magellan [in his Account of 'The Circumstances attending the Death of M. Rousseau,' M. R. December 1778, pag. 412] under the title of Mes Confessions: as an allusion to a work under that very title occurs twice in the present performance. In an advertisement presixed to it by the Editor, we are told that it was put into his hands by M. Rousseau, in the month of April 1776; with conditions annexed to the trust, which he has thought it to be his most indispensable duty to fulfil.

I ought to inform those,' says Mr. Boothby, who might be induced, by the celebrated name of the Author, to seek amusement in these sheets, that they will find nothing here to gratify their take, or to indulge their curiosity.' He adds, very properly in our opinion,—' the cool philosopher will deign perhaps to see in them an interesting collection of materials well

adapted to serve towards a history of the human mind."

If there be a pen,' adds the Editor, 'capable of delineating the most simple and the most sublime manners; a benevolence that took a share in all the miseries of mankind; a courage always ready to facrifice every thing to the cause of truth; and particularly those continual aspirations after the most sublime virtue, too elevated perhaps to be ever attained by human weakness, but which place those who feel them in a situation above that of ordinary minds; let such a pen write the life of Jean Jacques Raussaus.

After the Editor's Advertisement follows a Table of Contents; from which we learn that the present work, which is composed in the form of dialogue, is only the first of three that have been lest by the late Author. Its title is— Of the System of Conduct adopted by Administration toward Jean Jacques, with the Approbation of the Public. First Dialogue. The titles of the other two

dialogues,

dialogues, which the Editor informs us were not put into his hands, are—" Of the Temper [naturel] of Jean Jacques, and of his Habits [habitudes] Second Dialogue.—Of the Genius of

his Writings, and Conclusion. Third Dialogue."

To this first dialogue is prefixed a kind of Introduction, in which M. Rousseau treats ' of the subject and the form of this work.' On the page preceding and facing this Introduction, the Reader meets with the following fingular address; from the purport and style of which he is in some measure prepared for the striking fingularities that follow:

Whoever you be to whom heaven has given the disposal of these papers; to whatever use you may resolve to put them; and whatever opinion you may have of the Author; that unfortunate Author conjures you, by the feelings of humanity [par vos entrailles humaines], and by the repeated anguish which he has suffered in writing them, not to part with them till you have read the whole. Reflect that this favour, requested of you by a heart broken with grief, is a duty of equity [un devoir

d'équité] which Heaven requires of you.

As to the dialogue itself, we scarce know what account to give of it. It is supported by a Frenchman, and Rousseau; and the subject of their discourse is the moral and literary character of Jean Jacques (the Christian name of the Author), who is confidered as a third person. The Author puts into the Frenchman's mouth all the charges which he supposes the Public to have alleged against Jean Jacques, both as an Author and as a man; and makes him affign the supposed secret springs of their conduct towards him, in these two characters, as far as he can penetrate into them. Rousseau, in answer, defends Jean Jacques; and to account for the treatment which he has met with from the world, confrantly fuppeles that a league has been formed, the object of which is the debalement and defamation of poor Jean Jacques.

Why do I say, suppose?"-says the Rousseau, in the dialogue.— Whatever were the motives for forming this league, it exists. Even according to your own account, it seems to be universal; it is, at least, great, powerful, numerous; it acts in concert, and with the most profound secrecy with respect to all those who do not form a part of it, and especially to the unfortunate creature who is the object of it. To defend himself from this combination he has no succours, no friend, nor any support, counsel, or light to direct him. He sees nothing around him but snares, salsehoods, treacheries, and darkness. He finds himself absolutely alone, and has no resource but himself. He has no reason to expect any aid or affistance, from any one perfon on the face of the earth. A fituation fo fingular is an Unique, ever fince the human race came into existence.'-

From

From the strange tenour even of this single passage, the Reader will judge of the state of mind of the Writer. The sense we mean to convey by this last expression will readily occur on the perusal of what follows.—At the close of this dialogue M. Rousseau gives the following account of the plan which he had formed, to transmit this posthumous publication, unaltered, to

posterity.

"Here follows,' says he, "a copy of the superscription of the manuscript, containing these three dialogues, which I had resolved to deposit, under the sole protection of Providence, on the high altar of the church of Notre Dame at Paris. But on attempting to put this resolution in execution, on the 24th of February 1776, I sound that, through a precaution persectly new, the grates which inclose the choir, and through which alone I could reach the altar, had been shut up. I then saw myself obliged, if not to renounce my project, at least to change it; for I shall always think that I have very happily accomplished it, if I find a discreet and faithful depositary. Is there a more worthy instrument of the work of Providence than the hand of a virtuous man?"

# Deposit consigned to Providence.

Protector of the oppressed, God of justice and of truth, receive this deposit, which is placed upon thy altar, and confided to thy Providence by an unfortunate stranger, alone, without support, without a protector on the whole earth, abused, derided, defamed, betrayed by an entire generation, studiously oppressed during fifteen years with treatment worse than death, and with indignities hitherto unexampled among men, without ever having been able to learn the cause. All explanation is refused me, all communication is taken from me; I no longer expect from men, become still more exasperated by their own injustice, any thing but affronts, falfities, and treachery. Eternal Providence! my fole hope is in thee. Deign to take my deposit into thy keeping, that it may fall into young and faithful hands, who may transmit it exempt from fraud to a better generation; who, deploting my fate, may learn what treatment was received from the present, by a man without gall and without disguise, an enemy to every kind of injustice, but patient in suffering it, and who never either did, or willed, or returned, evil to any man. No man has a right, I know, to hope for a miracle, not even innocence oppressed and not known': as a time will come when order will take place, it is sufficient to wait. If my work be lost; if it is to be delivered up to my enemies, and to be destroyed or disfigured by them; as this appears unavoidable, I shall not the less rely upon thy work, although I am ignorant of the time, and the means; and after having exerted, as I ought, all my efforts towards that end, I wait with confidence, I repose

on thy justice, and refign myself to thy will.'

That numerous and respectable class of Readers, who have been charmed with the writings of M. Rousseau, will readily recognise his hand in this performance: at the same time, they cannot fail to be hurt at various parts of it, which exhibit a mortifying and affecting picture of the weaknesses of human nature; and particularly of the extreme and even marbid sensitive of this extraordinary man. The subjects discussed in this dialogue are so involved, and would require so much presatory explanation, that we cannot give any satisfactory specimens of it without transcribing several pages. Though the authenticity of the work is sufficiently ascertained by internal evidence; we shall add, that the original manuscript, written sair with M. Rousseau's own hand, has been deposited by the Editor in the Brisish Museum.

### ART. III.

Ed Sandifert Observationes, &c.—A Collection of Anatomical and Pathological Observations; Books 2d and 3d. By Ed. Sandifort, Professor of Physic, Anatomy, and Surgery, in the University of Leyden. 4to. Leyden. 1778 and 1779.

HE nature of this publication is such as to require from us only a short and general account of its contents. The second book is divided into eight chapters, the greater part of which contain anatomical descriptions, and pathological remarks,

relating to the uterus.

The Author having lately had an opportunity of diffecting the body of a woman big with child, who died before delivery, midnutely describes, in the first chapter, all the appearances on dissection; adding a variety of observations respecting the subject, made by the most accurate anatomists and physiologists. The description is illustrated by several plates, small indeed, but well executed. In the second chapter he offers various observations, deduced from actual diffections, with regard to the oblique position of the uterus, occasioned by the unequal length of the ligarments; as well as other remarks respecting the os uteri, and the occasional stoppage of the Fallopian tubes.

In the third chapter he treats principally of a human even, which had been expelled after about eleven weeks supposed pregnancy; and which, though it appeared to be persect in every other respect, was found not to contain the least vestige of a socius within it. Instances are likewise given of the degeneracy of a placenta into bydatides. The sourch chapter contains an account of several varieties in the placenta and umbilical

chord. In the fifth, are related the fatal consequences ensuing the too hasty and violent extraction of the placenta. In the fixth, the Author describes certain anchyloses of the offa pubis; and in the seventh and eighth he treats of some varieties in the number of different parts or organs of the body, and in the course of the lacteal vessels.

The third book is divided into ten chapters; in the first of which is given a very particular description, illustrated, as are almost all of the Author's observations, by figures, of a sexus born alive; in which were presented many remarkable conformations of various parts; particularly an immense umbilical rupture, in which were contained many of the viscera of the abdemen. In the second chapter are contained accounts of the offication of the pia mater, and of other parts: and in the third is given the history of a satal suppression of urine, in consequence of a stone sticking in the urethra; which was ruptured so as to form two canals.

The fourth chapter presents us with the case of a young lady, who had for two years had a tumour near the inner angle of the eye; which discharged matter, and caused the tears to flow continually down the cheek. The Author attempting the cure of this disorder by incision, discovered the cause of this complaint, which he soon removed, by the extraction of a stone somewhat bigger than a pea.

In the fifth chapter, an account is given of a remarkable thickness and hardness of the periteneum; and of a concretion or cohesion of almost all the abdominal viscera, in a body which he dissected. In this subject he found the feramen evale open; and observes, that this circumstance exists much oftener than is

suspected.

The fixth chapter contains some new observations, confirming and illustrating those which the Author had produced in the preceding book, relative to the human ovum. In the seventh is given a description of a singular kidney; and in the eighth and ninth, various observations respecting the sutures of the bones of the cranium. The tenth and last contains descriptions of various bones, which differ from the usual form. Besides the observations peculiar to the Author, he has collected many others relative to the subjects here treated of, from the best authors: and the plates, which amount to eighteen in the two books, appear to be executed with equal accuracy and neatness.

### ART. IV.

Collection de différent Traités, &c.—A Collection of several Treatises on Astronomical Instruments, and others, relative to various Branches of Experimental Philosophy, &c. With useful Tables, and Copper-plates. By J. H. de Magellau, F. R. S. Correspondent Member of the Royal Academy of Sciences at Paris, &c. 400. Paris and London. 12 s. Boards. White, Elmsley, &c. 1780.

HE Author of this Collection of ingenious tracts is equally well known to the learned world by his extensive correspondence, and by the zeal and ability with which he himself profecutes philosophical inquiries. In the Appendix to our 56th volume, June 1777, page 548, we gave an account of a very useful work published by him, containing a particular description of the English octants and sectants, or, as they are commonly called, Hadley's quadrants; together with the description of a new sectant invented by himself. The present work is to be confidered as a fequel or a fecond part of that performance. and appears to have been composed by the Author, principally in consequence of his having undertaken to superintend the construction of five capital collections of astronomical and philosophical instruments, executed by English artists for the court of Portugal; and foon afterwards of fix fimilar collections for the court of Spain. In these treatises the Author describes the various instruments in the most particular and satisfactory manner, as constructed under his inspection, by the first artists in London; giving a particular account of the various improvements they have lately received, many of which they owe to These descriptions are illustrated by several copperhimself. plates.

The first of these tracts contains the description of a new circular reflecting instrument, invented by the Author, for the purpose of observing, with the greatest precision, angular distances at sea: and a method is likewise shewn of altering the common

sectants, so as to obtain, in part, the same advantages.

In the second tract, Mr. Magellan describes, in the most minute manner, the construction and method of using the improved portable astronomical quadrants, which form a capital part of the above-mentioned collection; particularly with a view to the instruction of those, probably inexperienced, philosophical travellers, and navigators, or young astronomers, whose office it may be to make use of them. We should observe that these Collections are evidently intended for the use of philosophical expeditions, probably in South America; and the different instruments are accordingly disposed in their respective cases, in such a manner, that one complete collection is distributed.

App. Rev. Vol. lxiii. K k

buted into fix cases, nearly of equal weight, so as to be conve-

niently carried by three horses.

In the next tract, Mr. Magellan describes very fully the confiruction and uses of another part of this philosophical apparatus; we mean certain new partable barometers, adapted particularly to the measuring the height of mountains, and the depth of mines. In this part likewise the Author has contributed to the improvement of the instrument; and has taken laudable pains to make the young observer fully acquainted with every particular relative to the construction and manner of employing it; furnishing him likewise with various tables and examples, to render the practice of measuring heights familiar to him.

Besides the barometers appropriated to this particular service, the Author describes various others adapted to common purposes, and constructed with a view of rendering the variations in the height of the mercury more sensible. One of these was very lately invented by the Chevalier Landriani, of Milan, and is called the stereometrical barometer; but the short description of it here given cannot be rendered intelligible without the figure. The same observation may be applied to a new construction of a barometer proposed by the Author, under the title of the sectional barometer; in which the scale is magnified by the inclination of the tube, or its frame, which turns on an axis.

A third barometer which is here described, called the statical barometer, is not new, indeed; for it was the invention of the Chevalier (we believe Sir Samuel) Moreland, who presented one of them to Charles II. It is very extraordinary, Mr. Magellan observes, that no authors who have written upon the subject of barometers, have, as far as he recollects, made any mention of this instrument; nor has he seen more than two barometers of this kind, which he supposes to be the only two that exist in the world.—— One of them was made in the year 1760, by the late Mr. Adams, for his present Majesty, then Prince of Wales. The construction of the other had been begun, perhaps some time before, by the late Mr. Jonathan Sisson. I found it by chance, well preserved, in a private house, and purchased it; and I have it now by me, completely fitted up, having made some changes that may be considered as improvements in the construction.

We cannot describe this curious instrument without a plate: we shall observe, however, that it marks the variations in the heights of the mercury, by spaces twice as large as those in the simple barometer. We shall mention, too, an observation of the Author's relating to it, who remarks, that the perpetual clock, or time-piece, which was constructed in London some

years ago \*, and which perfectly succeeded, was formed on the same principles with this statical barometer; the motions produced in the mercury, by the varying pressure of the atmosphere, being employed in renewing, from time to time, the power

which gave motion to the pendulum.

'This idea,' fays Mr. Magellan, 'is very happy:—but modern mechanism has very lately advanced much surther, with respect to pocket-watches, which go continually, without the necessity of ever winding them up:—that office being persormed by the motions necessarily given to them by the person who wears them in his fob; and yet they are said not to differ, either in form or fize, from common watches.—'I have lately tried two,' he adds, 'made by Messrs. Spencer and Parkins, during the space of twenty-eight days, and was persectly satisfication.

fied with their performance.'

These observations are followed by a proposal of the Author's to construct a piece of mechanism, which he calls a perpetual meteorograph, or an instrument connected with a common timepiece, or eight-day clock, which shall perform the office of a constant and sedulous meteorological observer, and indicate the weight, temperature, and moissure of the air, the force of the wind, the quantity of rain, the state of the tide, and other meteorological desiderata, during the absence of the owner; as well as the precise hour, or even half hour, when the respective changes happened. The very ingenious ideas here thrown out by the Author, to facilitate the construction of an instrument of this kind, and which, it appears, have in part been executed by him, can only be understood by having recourse to the performance itself; where we learn-with respect to the barometer in particular—that a time-piece, which marks the motions of that instrument, has been going for fifteen years past, at Buckingham-house, made by Mr. Cummings; who has constructed another of the same kind, the price of which amounts to about 500 guineas;—and that the Author himself has executed a time-piece for the same purpose, but on a different plan, which did not cost more than the fifteenth part of that sum, and which has been going for a year past.

The title of the next treatise is—' An Essay on the new Theory of Elementary Fire, &c. with a Description of some new Thermometers particularly adapted to the making of Observations on that Subject.' The Author appears to have written this essay with a view to explain to philosophers in general, as well as to his soreign philosophical correspondents in particular, the principles on which Dr. Crawsord grounded his late theory of animal heat;

<sup>•</sup> The Author here alludes, we suppose, to the instrument exhibited at Mr. Cox's Museum.

as many of his friends had complained, perhaps not without reason, that they found some difficulty in comprehending the principles on which that hypothesis is founded. This difficulty Mr. Magellan very properly ascribes to Dr. Crawford's not having entered into a sufficient detail, or explained the basis of his theory in a manner fufficiently familiar. This essay is not only well adapted to ferve as an explanatory commentary on Dr. Crawford's work, but it likewise contains much new matter, and particularly the refults of several experiments made by Mr. Kirwan, on the specific beat, as it is called, of various bodies. For the sake of such of our philosophical readers as are yet unacquainted with this theory, or as an example of the doctine, we shall give the substance, or rather an amplification of one of Mr. Magellan's propositions, as being well adapted to convey a general idea of the changes that have been observed in the temperature of certain bodies, when they have been mixed together, which are not supposed to have any proper chemical action on each other.

It has long been known, that if a pound of water, of the temperature, for instance, of 162° F, be mixed with an equal quantity of water of the temperature of 32°, or just on the point of freezing, but fill fluid; the temperature of the mixture will be 97°, that is, just one half of the sum of the two numbers denoting the two temperatures; the heat being equally diffused throughout the mass \*. But if one of these portions of water be converted into ice, so as to assume a solid form, though its temperature be fearce fenfibly changed +, the heat of the other portion being 162°, as before, the refult, on their admixture with each other, will be very different. The following propofition of the Author's alludes to this last case.

- " Proposition 3d. The difference between the specific heat,"or, as Dr. Black has termed it, the latent heat, - of a fluid body, and that of the same body in a folial state (that is to say, in a state of crystallization, fixity, or bardness), is very considerable.'
- · · Demonstration. Take one pound of water, at the temperature of 162°; mix it with 1 pound of powdered ice, the temperature of which is 32°; agitate the mixture continually, fo that the ice may be dissolved or melted; and the temperature of the mixture' (instead of being 97°, as in the preceding case)

See M. Review, November 1779, pag. 384. Note A.
 It may be proper to observe, for the sake of those who may not be much conversant in observations of this kind, that there is a small latitude respecting the freezing point. Water, at 32°, may fill preferve its fluidity; and ice, at the same temperature, may still retain its folid form.

will only be 32°. Therefore the *specific heat* of water, in a state of *fluidity*, is 130° (for 162-32=130) more than that of the same water, in the form of ice, or in a *folid* state.'

The Author afterwards makes an ingenious supposition, which may be confidered as the converse of the foregoing proposition. He thinks it may be reasonably concluded, from the result of this last mentioned experiment, that if a pound of ice, 130° below the freezing point (that is, as many degrees below it as the water in the preceding experiment was above it) could be intimately mixed with, and diffolved in a pound of water at 32°, but still fluid, the temperature of the mixture would, in this case likewise, be 32°: or that the fluid water (at 32°) would in this case lose all that portion of its (specific) heat (amounting to 130°) to which alone it owed its state of sluidity; and which it would communicate to the pound of ice, so as just to melt it; the two pounds or masses of matter acquiring, on their admixture, exactly the temperature of 32 degrees. This experiment is perhaps impracticable; but a similar trial might be made with equal portions of ice and water, not varying so very greatly in temperature from each other as in this instance; or in other words, with ice not so cold, and water proportionably warmer.

These instances will be sufficient to give such of our philosophical readers, as may be unacquainted with this new theory of fire, some idea of the nature of the facts, or experiments from which it is deduced. We learn with pleasure, from a Postscript at the end of this effay, that Dr. Black has at length determined shortly to publish the observations which he has made relative to this curious subject. We should not neglest to observe, that Mr. Mageilan describes a method of constructing thermometers peculiarly adapted to inquiries of this nature. Nor should we omit taking notice of a short intimation, that a correspondent of the Author's, the ingenious M. Achard of Berlin, has lately invented a thermometer, adapted to indicate, with exactness, degrees of heat much superior to whatever can be sustained by those of glass. The bulbs and tubes of these new thermometers are made of a transparent kind of porcelain; and contain, instead of mercury, a metallic composition, confisting of two parts of bismuth, one of lead, and one of tin. As this mixture melts in a heat equal to that of boiling water, and as the mercurial thermometers will indicate about 600° of Fahrenheit, it is easy to observe that these new thermometers may be rendered comparable to those of mercury, and the scale be extended upwards in a regular manner.

The last tract contains a kind of descriptive catalogue, or inventory, of every member belonging to the astronomical, surveying. or, in short, philosophical apparatus, sent to the court of Spain. In this are comprehended directions, not only re-

Kk3 (pecting

specting the astronomical quadrants, and other instruments before treated of, but likewise accounts of astronomical clocks, and pocket watches (including a short description of a weeden pendulum invented by the Author, which is not affected by heat or cold, nor sensibly by moisture or dryness), telescopes, mariner's compasses, magnetic bars, theodolites, and various other subjects that interest the astronomical observer, or philo-

sophical traveller.

Though this performance appears to owe its publication to a particular circumstance—which, by the bye, restects the greatest credit on the artists of this kingdom—those who are interested in the subjects discussed in these tracts will here meet with many useful particulars not to be sound in the latest publications in which astronomical and other philosophical instruments are described. On whatever subject the Author treats, he every where speaks the language of information; and shews a desire—we ought rather to say a zeal—not only to be useful to the two courts who have had the good fortune to accept his services, and avail themselves of his talents, on this occasion, but to the public in general.

ART. V.

Francisci de Wasserberg Institutiones Chemica, &c.—Chemical Institutions for the Use of Students. By Francis de Wasserberg. Three Vols. 8vo. 15 s. sewed. Vienna. 1778, and 1779. Imposted by T. Lowndes, London.

HEMISTRY is an art of the most unquestionable utility, and of most extensive application. It has, of late more particularly, assumed not only an unforbidding, but even an engaging form, by the facility with which many of its most important researches are now conducted, and by the extension of them to numerous objects which had not before been attended to by the old spagnists. Every well executed attempt to explain the principles of this art is of course intitled to a favourable reception from the public.

In the present publication, the Author does not pretend to give his readers much original matter; though he occasionally, and indeed frequently, makes pertinent remarks on the different subjects of which he treats. But his principal intention is to explain the elements of chemistry, or rather to give the chemical history of bodies, for the use of those particularly who wish to be initiated in the principles of that science. His work, however, cannot fail of being useful, in some degree, to those even who are already well versed in it; as he has collected and arranged, under each distinct head, and in a language familiar to scholars at least, the latest observations and discoveries which have

have been published, relating to each subject, as they lie dispersed in academic memoirs, literary journals, or separate and detached publications, written in various languages; several of which are necessarily unknown even to many of those who have

long cultivated this art.

In the three volumes now before us, the Author has executed only a part of his plan; the present publication comprehending only the chemical history of all the metals and semi-The bulk of the performance is increased, in consequence of the method which the Author has frequently adopted, of quoting the very words of the respective authors who have best treated of particular subjects. He has followed this plan, because his work is principally and professedly drawn up for the use of Tyros, who have not an opportunity of having recourse to the originals. He wishes it, therefore, to be considered in the light of a Chemical Library; the parts of which are digested in a systematical order. In the first volume he has comprehended all the metals, except platina, the history of which he proposes to publish hereafter singly; and in the second and third he has given the chemical history of the semimetals: the second volume being wholly employed in treating of mercury and antimony; and the third containing the history of zinc, bismuth, nickel, arsenic, and cobalt.

As aurum fulminans is one of the most curious productions of chemistry, we shall extract from this work some of the latest observations that have been made, and which the Author has here collected, concerning it. From the experiments of Mr. Bergman in particular, as related in this work, it appears to be established beyond a doubt, that the presence of a welatile alcaline falt, either in the aqua regia, or the menstruum, in which the gold is dissolved, or the use of it as a precipitant, is absolutely necessary towards giving the golden precipitate the quality of fulmination. A calk of gold, precipitated with fixed aliali, and which will not detonate, immediately acquires a desonating quality, on being fimply digested in volatile alcaline spirit, and then edulcorated and dried. Nay a similar inert calx, which had been digested during twenty-four hours with vitriolic acid (with a view to expel any part of the aqua regia that might be suspected to adhere to it), acquired a detonating quality, on being digested either with a weak solution of volatile alcaline falt in water or in spirit, or with caustic volatile alcali; or even with a folution of common fal ammoniac, or with nitrous, or lastly vitriolic ammoniac.

This volatile alcali, which is so readily expelled from other Substances with which it is combined, either by means of a fixed alcali, or by the mineral acids, refifts every attempt (in-

K k 4 dependent dependent of heat) that has been made to expel it from the calz of this metal.

It is true, that it has been affirmed by our ingenious countryman Dr. Lewis, and by others, that aurum fulminans has been deprived of its fulminating property, by digesting it with fixed alcaline lixivia, or with oil of vitriol. Mr. Bergman, however, 'triturated for a long time six parts of salt of tartar with one part of aurum fulminans, and a sew drops of distilled water. Adding more water, which was expelled in a heat of digestion, no smell of volatile alcali was perceived during the process. The residuum properly edulcorated and dried, not only detonated, but more strongly than usual. Again, he exposed, during two hours, to a boiling heat, one part of sulminating gold, recently prepared, together with two hundred parts of caustic alcaline lixivium: but in this case likewise, the detonating property of the powder was rather increased than diminished.'

The fact appears to be, that in the cases above mentioned, in which the aurum fulminans lost its subminating quality; that loss was occasioned, not by the chemical action of the alcaline salt upon it, but by the increased heat, which a strong alcaline lixivium is capable of acquiring, when exposed to the fire: for it has been observed, that heat alone, properly regulated, so as to be just inferior to that which will produce an explosion, will, if applied a sufficient time, deprive the aurum fulminans of its detonating property. Accordingly, Mr. Bergman, using a diluted alcaline solution, which could not acquire a heat much greater than that of simple water, sound, that the aurum fulminans was not injured by being boiled in it.

The Author alleges, that falt of tartar, and many other subflances, may deprive aurum fulminans of its peculiar property, merely by the mechanical interposition of their particles, without any chemical action upon it. He took some sulminating gold, which had apparently lost its detonating quality, by being treated with an alcaline salt. Having well edulcorated it, and boiled it in water, so as to separate from it all the interposed alcali, he sound, that its sulminating property was again restored to it.

When aurum fulminans is boiled in oil of vitriol, it certainly loses its fulminating quality; and, on the expulsion of the acid, the gold reassumes its metallic state. But here too Mr. Bergman's experiments, as related by the Author, seem to shew, that the effect depends entirely on the heat of the concentrated boiling acid: for, on diluting the acid, so as to render it incapable of acquiring so great a heat, the powder boiled in it did not lose its sulminating property. Lest objections should

should be made to his using a weak or diluted acid, he rubbed and digested this powder (we suppose without heat) with the most highly concentrated vitriolic acid, and sound that it still

retained its fulminating property.

No fatisfactory hypothesis has yet been invented to explain the action of this wonderful powder; half a drachm of which, as M. Beaumé informs us (and not half a grain, as the Author fays \*), though fired in the open air, produces a louder explosion than even some pounds of gun-powder fired from a cannon. The opinion which has hitherto been thought the most probable was, that its effects were principally owing to a nitrous ammoniac, or nitrum flammans, as it has been called, or to a nitrous sulphur contained in the composition: but Mr. Bergman appears to have overturned this manner of accounting for the phenomenon, by producing a genuine aurum fulminans, or a fulminating calx of gold, which, according to him, does not contain any nitrous acid. This, he thinks, he has effected by disfolving a precipitate of this metal (which would not detonate) in vitriolic acid; and then again producing a fresh precipitation by means of volatile alcali, which was found to be posfessed of a fulminating quality.

We do not however concur in opinion with the Author, in thinking, that Mr. Bergman's trials decifively prove, that no notice and was contained, or could possibly remain, in the above-mentioned calx, after it had been digested with oil of vitriol; as the nitrous acid might possibly be so intimately combined with the calx, as to resist the means he employed to dislodge it. We shall offer the following observation, as better adapted to shew, either that no nitrous acid is contained in the calx; or, at least, not in a sufficient quantity to account for the

phenomena presented by this powder.

Mr. Bergman has lately observed, what has been long ago remarked, that aurum fulminans exposed to heat in strong vessels exactly closed, or without any communication with the external air, does not produce any explosion; the gold being reduced to its metallic state without noise. Now it is well known, that in gun-powder, as well as in other combinations of the nitrous acid with instammable matters (for such the volatile alcali, an ingredient in the aurum fulminans, undoubtedly contains), a deslagration, or even a detonation, will take place

<sup>\*</sup> M. Beaumé, of whom the Author very frequently speaks not very respectfully, though so largely indebted to his valuable writings, may here very justly apply to the Author himself what the latter soon afterwards says of M. Beaumé, on account of his having committed a mistake in quoting from Mr. Bergman,— Parum sane exacta talis of authorum citatio.

even in close vessels, or without the access of common air, in consequence of the dephlogisticated air generated from the nitrous acid, as hath been of late fully explained by many of Dr. Priestley's experiments; from whose mode of experimenting alone, we apprehend a satisfactory solution of the phenomena of the aurum fulminans, and other powders of a similar kind, is to be obtained.

No person who writes on the subject of aurum fulminans, and perhaps excites his readers to the making experiments on it, ought to omit giving them the most earnest cautions with respect to the handling of so dangerous a substance. We shall therefore observe, that the most dreadful and horrid mischiefs have followed the explosion even of no great quantity of it; and surther, that the whole quantity contained in a vial has more than once been kindled by the accession of a small unheeded particle that happened to stick in the neck of the vial, and which has been fired, by its suffering only the slight friction given it by merely thrusting in the glass stopper.

To what we have already said of this work, and of its utility with respect to those particularly who wish to enter on the study of chemistry, we shall only add, that, in the succeeding volume, the Author proposes to include the Chemical History of the inflammable, and, if possible, of the saline substances.

Didionnajre de Chemie, &c.—A Dictionary of Chemistry, containing the Theory and Practice of that Science; together with its Application to Natural Philosophy, Natural History, Medicine, and the Arts depending upon Chemistry. Second Edition, revised, and considerably augmented. By M. Macquer, M. D. &c. 4 vols. 12mo. Paris. 1778, &c.

HOUGH the fourth and last volume of the second edition of this valuable work (the three first of which were published in 1778) has been in our hands some time, we think we shall do an acceptable service to those who interest themselves in chemical researches, to inform them of the very considerable additions, and the great improvements, which it has received, and which render its bulk nearly double to that of the first edition. The merit of the work, as first published, is now too well known, to render it necessary for us to refer to the character of it given in our 46th Volume, March 1772, or indeed rather of Mr. Keir's excellent translation of it, enriched with notes, and with new articles added by himself; several of which, as well as of those added to the German translation by M. Poerner, M. Macquer has adopted in the present edition.

In this edition the greatest part of the articles has received some improvement or augmentation. The number of persons who cultivate chemistry is now so great, that new lights are almost daily thrown on various subjects of that science. The most extensive additions, however, that have been made to the first edition of this work are to be found under the words, Affinity, Charcoal, Metallic Calces, Quick-lime, Combustion, Mizeral Waters, Gaustic Volatile Alcaline Spirit of Sal Aumoniac, Iron, Fire, Luna Cornea, Nitre, Bones of Animals, Gravity, Phlogiston, Phosphoric Stones, Platina, Salt, Sulphur, Emetic Tartar, Art of Dying, Vessels and Utensils of Chemistry, Varnish, Wine, Vitrisication, and many others.

Besides these augmentations of former titles, this edition contains many articles, or rather differtations, that are entirely new; the principal of which, as indicated by the Author, occur under the words, Causticity, Diamond, Flower, Magnesia, Molybdenum, Nickel, Nitre with a basis of Magnesia, Blood of Animals, Acid Soaps, Soldering, Amber, Sugar, Vessels appropriated to Cookery, Burning Glass, and several others of less conse-

quence.

In the preceding list we have omitted to mention the most material and bulky of the additions that have been made to this work, and which are presented in nine or ten large articles, under the title Gas, or (to follow the nomenclature of Dr. Priestley, and the greater part of our countrymen) Air. The interesting and important observations that have been lately made on this fruitful subject, have very justly excited the particular attention of the Author, who has bestowed above 160 pages in forming, from the observations of Dr. Priestley and his numerous sellow-labourers, an excellent compendium of the many discoveries that have been made in this new branch of chemical science within these sew years. The necessity of such an addition had likewise occurred to the English Translator, who formed a similar epitome, as a necessary appendix to the second improved edition of his translation.

Two novelties ought not to be passed over unnoticed, which distinguish this edition of the Dictionary of Chemistry from the preceding edition, and indeed from all other Dictionaries, and which, in a very considerable degree, add to the utility of it. The essential articles of the work are of such extent, that they might form a regular treatise, were they not, as it were, insulated, and detached from each other, in consequence of their alphabetical arrangement. The Author has therefore planned a certain order, in which the articles are to be read by those who would use the work as a systematical treatise; pointing out the method which the reader is to follow in the perusal of it, and particularly naming the different articles in succession,

in a kind of tabular order; affigning, at the same time, the reasons on which the proposed train of reading is sounded. The Author is so perspicuous a writer, that, we apprehend, the chemical student may meet with more information in the proposed mode of perusing this Dictionary, than from many Authors who have treated the same subjects in a systematic form. In sact, however, as the Author himself in part observes, this work is not properly a Dictionary, but a collection of treatises or differtations on subjects which, however dispersed or separated in consequence of an alphabetical arrangement, have a natural relation to, and an intimate connection with, each other.

The next fingularity, which closes this Dictionary, is an Index, or Table of Matters, of the most extensive and comprehenfive kind, and which occupies no less than 440 pages. It is executed in such a manner by a Friend of the Author, as not only to answer the common purposes for which Indexes are usually made; but is, at the same time, a most instructive compendium or abridgement of the whole work. The more extenfive articles of the Dictionary, in particular, are here briefly, but satisfactorily, analyzed under each head; and, at the same time, the reader who wishes for information on a particular fubject, which is not to be found in the Dictionary, under a particular title, but lies perhaps concealed in the middle of a long differtation, readily finds the information he wants, by having recourse to this very communicative Index. In short, the Index itself, or the greater part of it, may be read with fatisfaction and improvement, or as a remembrancer, by those who are somewhat conversant in chemistry; as there is scarce an essential paragraph in the Dictionary, the substance of which is not there announced, at least in a few words. ---- A short account of a few recent observations or discoveries contained in fome of the articles added in this edition, may possibly be new and acceptable to many of our philosophical readers.

Under the articles, Bones of Animals and Phosphorus, an account is given of a late curious discovery made by Mr. Scheele (who discovered the Acid of Spar), relative to phosphorus, or the phosphoric acid; a substance which, on account of its dearness, has not hitherto perhaps been so extensively examined, as it will probably be hereafter, in consequence of this new and easy method of procuring it. It has been discovered by him, that the bones of animals contain a large quantity of this acid, which has hitherto been procured, with great difficulty and disgust, from urine; but which may be extracted from bones, by a very simple and easy process. M. Macquer, though he has executed the process with success, does not enter into any particular detail. Though we cannot add any thing with re-

spect to quantities, we shall supply a few deficiencies in this article from our reading elsewhere, and indeed from our own

experience.

The nature of the earth which forms the basis of the bones of animals has, till very lately, been entirely unknown to chemists, who did not suspect that it was combined with a certain fixed principle, which disguised it, and which eluded the action of the most violent heat employed in calcination. Mr. Scheele has afcertained, that bones principally confift of a true calcareous earth, intimately combined with the phosphoric acid. On adding oil of vitriol to bones reduced to powder, or which have even been previously calcined to whiteness, the vitriolic acid having a greater affinity to the calcareous earth than the phosphoric, immediately combines with that earth, and expels from thence the phosphoric acid. Heating the matter in a proper vessel, hot water is to be successively added to it, till all that is soluble or acid in it be extracted; the water is then to be distilled or evaporated down to a small quantity. It will thus gradually deposit the selenite which is contained in it, and which is to be removed. It is then to be reduced to a pretty thick confishence, or may be brought into the state of a dry vitriform faline mass, in a crucible. It appears now to differ from the phosphoric acid of urine, in a vitreous state, only in its still retaining a portion of selenite or earthy matter. If this subflance be now mixed with a proper quantity of charcoal, and be subjected to distillation, even in a heat which a coated glass retort is capable of fuftaining, a phosphorus will come over perfectly fimilar to that obtained from urine.

M. Rouelle has observed, that a greater quantity of the phosphoric salt may be procured from sresh bones, than from such as have been calcined. With respect to the quantity that may be obtained, M. Macquer estimates, from the experiments which he has made on this subject, that three or sour ounces of it may

be procured from each pound of bone, or hartshorn.

Another, but apparently a more expensive and operose, method of extracting this acid from bones is likewise here indicated. Nitrous acid is to be added to them, which will totally dissolve them. Vitriolic acid is then to be gradually added to the solution, till no more selenite appears to be precipitated from it: The liquor is then to be distilled or evaporated; to expel all the nitrous acid now set at liberty, and the excess, should there be any, of the vitriolic, together with all the humidity. The residuum, thus obtained, will be similar to the preceding, and equally fit for the preparation of phosphorus.

An experiment which M. Macquer relates, towards the end of the article Gas, as having been communicated to him by M. Bucquet, deserves notice; as it seems, as he observes, to

**ftrike** 

. . . <u>Y</u>

firike at the basis of Dr. Black's, or the present received, sheory relating to quick-lime, and fixed air; and as M. Macquer takes pains, we think without success, to explain it.

According to the present theory, mild calcareous earths expel the volatile alcali from sal ammoniac, in a concrete, solid, or mild state; because they surnish it with fixed air: and quick-lime expels the volatile alcali from the same salt, in a sluid and caustic state; because it does not contain the fixed air which is requisite to render the volatile alcali mild. M. Bucquet, however, affirms, that the earthy pellicle, or crust, formed on the surface of lime water exposed to the air, and which (as being, according to the present theory, in a mild state) ought to act upon the sal ammoniac in the same manner as lime stone, or chalk, on the contrary, expels from it a volatile alcali in a sluid and caustic state.

Though it is more proper to make experiments to clear up this difficulty, than to form theories, or to reason upon it; the latter only happens at present to be in our power: except indeed with respect to what we have to object against M. Macquer's solution of it. We shall observe, therefore—first taking the fact for granted—that M. Macquer's manner of accounting for it is by no means satisfactory. He supposes, that the crust is principally formed, in consequence of the mere avolation of a part of its former solvent, the water; and consequently, that it is still left in as caustic a state as when it was dissolved in it: lime water being a faturated folution of the lime in water; and therefore not capable of retaining the whole of the lime in a state of folution, when a part of its folvent, the water, is evaporated. M. Macquer proposes, at some length, the trial of a particular experiment, to ascertain the justice of this manner of accounting for the fact: but a much more simple and expeditious mode of inquiry, which overturns his folution, occurs to us; and has been executed, even while we are writing on this subject.—A quantity of strong lime water was exposed to the air, previously diluted with a much larger quantity of fimple water than the mixture could possibly lose, by evaporation, during the course of the experiment. In less than two hours, a palpable crust was formed on its surface; though the quantity of water, which had been added to the lime water, would not have been evaporated from it in the course of several days.

We think that the phenomenon is easily and naturally to be accounted for, by only supposing that the lime (or, as it certainly ought rather to be called,—the calcarcous falt) suddenly loses its property of being soluble in water, on its recovering a very small portion of its fixed air from the atmosphere. In that case, it does not contain a sufficient quantity of the last mentioned principle to contribute to the sormation of a mild volatile alcali.

Under

Under the new Article, Burning-glass, M. Macquer has related a variety of experiments formerly made by others, as well as other trials lately made by himself; particularly with the large and magnificent glass of M. Trudaine. This capital infirument consists of two large curved plates of glass, each eight lines thick, whose concave surfaces are turned towards each other; so as to form a lenticular cavity of four feet in diameter, and which is filled with 140 French pints [we believe, English quarts] of spirit of wine. The thickness or depth of the spirit at the center of the glass is six inches and five lines; and each of the glasses has been formed on a radius of eight feet. Its focus of parallel rays is at the distance of ten feet ten inches and one line from the centre of the lens; and the image of the sun there formed is 15 lines in diameter. This focus is occasionally contracted, to a circle of about eight lines in diameter, and the heat accordingly considerably augmented, by the interposition of a second and smaller lens of solid glass.

From the experiments made upon pure gold with this powerful instrument, it appears, that that metal actually undergoes a partial vitrification; and that the smoke which is seen to arise from it does not proceed from a decomposition of the metal, but is a vapour of the gold itself: for on holding a cold plate of silver over it, the vapour was condensed on its surface so as to gild it. Those who delight in the marvellous, M. Macquer observes, have not only been inclined to consider this smoke as one of the constituent principles of the gold [Homberg, in fact, considered for a that, on its gilding the plate of silver, this same supposed principle actually combined with the silver, and effected a real transmutation of it into gold. M. Macquer has however fully shewn, that this vapour consists of the intire gold in substance.

We shall only mention another very singular observation relative to this subject. M. Macquer observes, that during these experiments, the melted globule of gold was seen frequently to turn round on its center during a considerable space of time; and further, that any little detached particles that were seen on its surface, constantly moved to the inferior part of the globule that was opposite to the sun; and that whenever they were purposely turned half round towards the sun, they quickly returned to their former situation. He considers this effect as being produced by a mechanical impulsion of the solar rays.

A fingular circumstance relative to the solar rays thus collected into a focus, deserves particular attention. It occurs under the Article, Fire. A pane of glass, as thin as a sheet of paper, which would melt in an instant, on putting it into the stame of a candle, resisted the violent heat of the focus as long as he chose to hold it there: although in the very same place, a sufficiently large piece of iron would melt in an instant, and throw out red hot sparks to more than the distance of a soot. On the occasion of this curious observation, our philosophical Readers will naturally be reminded of Mr. Melville's ingenious Observations on Light, published in one of the Volumes of the Edinburgh Physical and Literary Essays.

## ART. VII.

Beyträge zur Kentniss Grossbritanniens, &c. i. e. Essays on the present S ate of Great Britain. Lemgo. 8vo. 1780.

On the character of the English—On the English constitution—On the British land and sea forces—On taxes and national debt—On the provision made for the poor—On the English laws, courts of judicature, and the manner of administering justice—On trade—Remarks on the city of London—On the curiosities, and other things worth seeing, in London and its environs—Advice to foreigners who visit England.

The Author of these Essays, whose name is not mentioned, has been many years resident in London, as he declares in the Presace to his book; and we think his observations on the several subjects which he treats are, in general, very just. He promises another Volume, wherein he intends to give an account of the state of religion, of the literature, and of the arts and sciences of this kingdom.

#### TO OUR READERS.

At the desire of many of our English Readers, who feem to be more peculiarly interested in the Literature of their own country, we propose, for the future, to gratify their partiality by a new division of our APPENDIX; appropriating one part of it to Foreign, and the other to British Publications: and by this means we hope to provide a dish for every palate.

### BRITISH PUBLICATIONS.

#### Art. I.

A Galic and English Distinary; containing all the Words in the Scotch and Irish Dialects of the Celtic, that could be collected from the Voice, and old Books and MSS. By the Rev. William Shaw, A. M. 2 Vols. 4:0. 2 l. 2 s. in Boards. Murray, &c. 1730.

HIS Dictionary must be a valuable acquisition to the student in GALIC; for it appears to be the result of unwearied application, and a thorough acquaintance with the language.

guage. The Poems of Offian, &c. have given some eclat to the Galic; though we apprehend very sew Englishmen will be at the pains of studying the language with grammatical precision, in order to compare Mr. M'Pherson's translation with the originals. Those that give him credit for his sidelity as a collector of the traditional or written songs of the Highland bards, will not be very forward to dispute his accuracy as a translator: Sturdy sceptics, who quarrel with his honesty, think every subordinate enquiry lost in the contention; and to them it is matter of persect indifference, whether a man can translate Galic into English, or English into Galic.

If, however, the Galic be, as Mr. Shaw supposes it really was, 'the speech of paradise,' putting Offian out of the question, it would be a sufficient motive to excite a curious man to study it, for its high antiquity, yea its divine origin. The language immediately taught our first parents by God himself must have beauties worthy of its Author, and a purity and simplicity in some degree congenial to the primitive innocence of the happy pair, to whom it was originally communicated.

This idea operated very strongly on our Author, and was one motive to his present undertaking. 'Observing (says he) with regret, the indolence and inactive zeal of my compatriots in the cause of their expiring language, with the most ardent enthusiasm I was impelled to attempt snatching from oblivion, and, in her last struggles for existence, preserve in a Dictionary, as much as possible of the greatest monument of antiquity perhaps now in the world: for the Galic is the language of Japhet, spoken before the Deluge, and probably the speech of Paradise.'

This affertion is accompanied with no proof: but perhaps the Author imagined the matter had been sufficiently settled by the congenial enthusiasm of the adventurous Historian of the primitive tongue, Mr. Rowland Jones, in a certain Treatise on the "Origin of Language and Nations, hieroglyphically, etymologically, topographically, defined and fixed." Now, inspired with the same ardent passion for the Welsh, as our Author is for the Erfe (both indeed being branches shooting out from the same paradisaical root), this bold adventurer into the darkest of dark times assures us, that " various matters of antiquity are treated by him in a method entirely new."——We believe him. But to supply Mr. Shaw's defect, who hath contented himself with a bare position, without offering any argument, or producing any authority, to establish it, we shall present our Readers with Mr. Rowland Jones's sagacious reason for giving the Celtic an ante-diluvian existence. "Babel was called fo from ba-bi-el; i. e. beings calling like Ba's, or sheep. -It is likely that this language, as it thus defines the prediluvian as well as the post-diluvian names, and gives the etymo-APP. REV. Vol. lxiii.

logy of languages preferable to any other, must have existed before the confusion of languages; and if all the world spake in
one language, this must be it."—Stimulated by an enthusiasm
equally patriotic, a certain Scandinavian historian hath "defined and fixed" the seat of Paradise in Norway!—Thus will
zeal for a favourite system betray the most learned mea into
absurdities, and produce a fondness that borders on childishness,
and grows testy and wayward the moment its darling wishes are
opposed.

We infert these restections, not to depreciate the general merit of the work before us, but to discourage that blind attachment to national prejudices, in which some writers consider the very honour of their country as so essentially concerned, that they frequently sacrifice good sense and moderation, while

they press forward in support of them.

The Author, after some general observations on the present laborious undertaking, informs us in his Presace, that, in order to complete it, he undertook a journey from London to the Highlands of Scotland in the spring of 1778. Having (says he) made a progress into almost every corner of the highland part of the continent, and visited the most considerable of the Hebrides, exposed to much fatigue, and many inconveniences, I passed over to Ireland, there also to pursue the Galie; and returned to London in 1779, after a perambulation of about three thousand miles, with a collection of near thirty thousand articles for a Dictionary.

"In the Highlands, there being few books, and still fewer manuscripts, in the Scotch dialect, the language in the living voice was the only source from which I could glean vocables. In the island of Mull, however, Mr. M'Arthur, one of the ministers there, who understands the language well, laid before me about 200 words, part of which I transcribed, uncertain

whether I had seen them before.

The better class of the people every where, with alacrity, afforded every possible information, and for that purpose seldom spoke to me but in the ancient tongue, turning the conversation on various subjects, to give an opportunity of catching new words. But the common people, who are generally possessed of whatever narration remains in the country, must all be bought. They told me I had been well paid by his Majesty for what I undertook, otherwise I should not have been at so much pains; and therefore they seldom opened their mouths before they were paid.

Our Author acknowledges his particular obligations to Sir John Foulis; and when he confiders the pains this gentleman hath taken in treasuring up whatever is curious of Celtic origin, and with what liberality he communicates the result of his investigations, for the service of the public, he hopes some bard will write his epitaph, and every patriot gaedheal add a stone to his carn.'

In Ireland (fays Mr. Shaw) I have been chiefly obliged to Colonel Vallancy, who, by indefacigable industry, hath acquired a thorough acquaintance with the Galic, and deserves much of all the friends of the antiquities of that nation. Trinity College library contains many books and manuscripts in the old letter, and on a variety of subjects, to which I had access by means of Dr. Cleghorn, and the indulgence of Dr. These volumes, elegantly transcribed, but sealed Leland. books to most of the present age, while I surveyed and examined them, and looked back on the ancient state of this once bleffed and lettered island, produced emotions easier conceived than described.'---This Work indeed merits encouragement. and we hope the Author will be fully rewarded for his affiduity. The lift of subscribers, though not numerous, is respectable. The Author mentions General Melvil as his principal patron. and bestows a very handsome compliment on his taste for ancient and modern learning. B...k.

## ART. II.

Letters from Baron Haller to his Daughter, on the Truths of the Chriftian Religion. Translated from the German. Small 8vo. 3s. 6d. fewed. Murray. 1780.

HIS learned Writer hath very deservedly distinguished himself by his physiological essays. His genius and studies were chiefly adapted to medical and philosophical enquiries. He mistook his talents, when he adventured to soar into the regions of fancy; hence his Usong will ever be regarded, by persons of taste, as the laboured effort of a slow and cold imagination, which borrowed from art what should have been produced by genius, and made correctness supply the place of invention. Its moral may be good, its sentiments pure, and the whole well intended; but if fancy creates, it must interest. If we are delighted with its visions, we must realise them. It is easy to be romantic, when imagination acts without the guidance of good sense. To preserve the truth and force of nature, amidst the wild rovings of a rapt and lively fancy, requires the first qualities of human genius—a vigorous invention, and a correct judgment.

But these remarks, we must confess, are not essential to the present subject. The name of the Author, and the recollection of his former productions, betrayed us into them. We have no dispute with Baron Haller, either as a student of nature, where he was successful, or an adventurer in the more L 1 2

airy and hazardous track of fancy, where his genius failed him. Our present concern with this good man is confined to another object,—an object, indeed, on which he himself appears to have set the highest value towards the close of his life;

-and that was, the orthodoxy of his faith:

The Translator, in his Preface to these Letters, informs us, that 'this great and good man, in the earlier part of life, had his doubts concerning the objects of the Christian faith; but these doubts were dispelled by a successful application to every branch of science on the one hand, and by a candid examina-While his humane tion of the sacred oracles on the other. and feeling mind embraced, in the bonds of love, all his fellow-men, and interested them in their present and suture concerns, there was one person, whom God and nature had recommended to his peculiar attention and care. He had a daughter, dear to him as his own foul. To her he addressed. at different times, but in a regular succession, these Letters, which were afterwards, by his permission, published for the benefit of the world at large. They have met on the continent, and it is to be hoped they will meet in this island, with a favourable reception.'

The capital design of these Letters is, to collect the most striking evidences of Christianity into as small a compass as the nature of such an undertaking would admit. The Editor passes too extravagant an encomium on them, when he says, that 'they exhibit the completest desence of Christianity that has yet been offered to the world.' We have a much lower opinion of their merit, though we are by no means disposed to depreciate it.—The Author hath gone over an old and beaten track; and though what he hath advanced may be very edifying to common Christians, yet he hath produced no new argument; nor hath he placed any old one in such a light as to-

make it appear more striking, or give it more force.

The good Baron hath pushed his faith into the darkest corners of mystery; and, like Gresset, one of the French beaux-sprits, became an enthusiast in his old age, in order to be at the farthest distance from the insidelity which tainted his youth.

Mr. Haller (says his Editor very gravely) receives with pious awe, even what he cannot comprehend, and with humble confidence walks forward into those regions, where, according to the figure of the poet,——" Lame faith leads understanding blind."

This lame faith indeed seems to be a very proper guide to a blind understanding;—for if it had the happiness of seeing for it-felf, it would scorn to be indebted to such a conductor!

We must, however, in justice, remark, that the good intention with which these Letters were written, and the piety which which breathes through the whole, ought to relax the feverity of criticism, and recommend them to the esteem of the Christian reader; who, if he cannot approve of all the Author's sentiments, may be edified by some; and, from the charity which is here inculcated, may learn to excuse what he cannot applicable.

The Reader may be able to form some judgment of Mr. Haller's address in the management of a metaphysico-theological argument, by the following extract from the eleventh Letter:

God hath joined the foul to the body, the divine to the human nature; a being indivisible, simple, immeasurable, without extent, without any corporeal property, to a body infinitely inserior to it. This is a truth of which we are absolutely convinced. Though a disquisition of this nature falls not within my present design, yet I have used the consideration only by way of example.

That a being incorporeal and indivisible governs the world, and that all motion is derived from him, though the operation is invisible, are truths universally believed. Why then may he not act upon spirits, immaterial and indivisible like himself? Why is it impossible that the divine attributes, such as wisdom, goodness and justice, and the power of working miracles, should be intimately united with a created spirit, and displayed in him,

though after a particular manner?

'I am no theologian, and therefore do not employ those terms of art which have been invented by disputants on the incarnation of our Saviour, and the union of God and Christ. I must, however, remark, that the word person is improperly used, fince it implies, as every one knows, a thing different from every other thing, which thinks, wills, and acts, for itfelf only. Now we cannot suppose any such distinction in the Divinity. I think, however, that the words of our Saviour himself oblige me to believe, and with a full acquiescence of faith, that Jesus Christ was not a simple man, nor even a mere angelic being; but that the Author and Creator of all things hath united himself, in an incomprehensible manner, to beings which are not pure spirits; to the human soul of Christ; that in this foul were visibly manifested divine qualities and perfections; and that this union of the divine with the human nature was in Jesus so intimate and persect, that he both thought and acted as God thinks and acts; and that it was with juftice, therefore, that divine honours were paid him, and that he was called God.'

No person ever wrote on this intricate subject without adding, in some degree or other, to its obscurity. Orthodox as the Baron strikes to be, yet as he hath attempted to accommodate matters between faith and reason, mystery and philosophy,

he hath incautiously inclined a point or two toward herefy, A writer who would maintain a character for foundness in the faith, must (unless he is very found indeed!) avoid, as much as possible, all explanations and definitions of a prosound doctrine. If he be pressed hard for a definition, let him confine himself to mere negatives. One positive term may ruin his cause for ever! We give this advice to those many gentlemen of the house of Moderation, who are anxious to keep terms with orthodoxy and herefy; -gentlemen who eat the bread of the former, and are ambitious to gain the good word of the latter; -gentlemen who must be thought found, or the saints will starve them; yet not too found, for then the finners will laugh at them !--- If a man be indeed heartily orthodox, he may be as positive as he pleases: he may define, and not refine,-to use an orthodox pun; -and, like his Dutch preceptor [Marck], may describe personality as " a positive mode of entity, ultimately terminating and comprehending a substantial nature, giving to it incommunicability." Q. E. D. B...k.

## ART. III.

Memoirs of the Life, Death, and awonderful Writings of Jacob Behmen; now first done at large into English from the best Edition of his Works in the original German; with an introductory Presace of the Translator, directing to the right Use of this mysterious and extraordinary Theosopher. By Francis Okely, sormerly of St. John's College, Cambridge. 8vo. 2s. sewed. Lackington. 1780.

THE Reformation, which opened fuch an extensive field for the improvement of the human understanding in every branch of scientific and theological knowledge, produced fuch consequences as will ever mark its impersection, though, in the eye of wisdom and candour, they by no means disprove its utility and importance. They were indeed the natural consequences of a work that was not immediately under the controul of divine power, and was not directed, in every step of it, by the extraordinary influence of unerring Wisdom. men are left, in a great measure, to their own free will, they will too often mingle their passions and prejudices with the dictates and resolutions of cooler and steadier principles; so that, if their designs are not wholly deseated, they will at least be impaired, and rendered defective. That illustrious event, which produced a new revolution in the Christian world, and unfolded new and unknown objects to the mind, to awaken its curiofity, and call forth all its powers, introduced fuch a fudden and surprising change on the face of religion, that weak and visionary understandings were confounded at the views it exhibited; and not knowing how to make a temperate and discreet tife of the liberty it granted, they ran into all the extremes of a wild enthusiasm, or a sullen mysticism, according as they were impelled by a lively or a dark and gloomy imagination. The fanatical Anabaptists of Munster were among the first who attempted to improve on the Reformation; and, by a kind of spiritual hilarity, scarcely equalled in any other period of the Christian church, they pushed the freedom of the gospel to the utmost extreme of licentiousness, and engendered a species of practical, as well as speculative, Antinomianism, that would not even find a place in the creed of Count Zinzendors himself. The enormities of this sactious and pestilent sect were of too gross a nature to gain an establishment: Common sense and common decency joined with the more rigorous power of the magistrate to crush them in the beginning.

The opposite refinement on the Reformation, which adopted the name of Myslicism, was of a more innocent nature,—less alluring to the passions than enthusiasm, and, of consequence, less calculated to affect any political or ecclesiastical establishment. Its principles lay very remote from vulgar comprehension, and the practical parts of its system were of too morose and

forbidding a complexion, to captivate the generality.

Such were the principles, and such the system, of the mysterious and extraordinary Theosopher whose life is here presented to the public. His writings are so dark and consused, so involved in all the intricacies of discordant metaphors, so perplexed by the unnatural union of abstract terms and sensible images, that it requires more than ordinary attention to catch sometimes even a glimpse of their meaning; and after long and diligent enquiries, men of the deepest penetration have confessed, that what they have understood of these mysterious writings, hath borne but a small proportion to what hath remained altogether unintelligible.

Jacob indeed was himself fully aware, that the charge of obscurity would be very generally brought against his writings; and he honestly acknowledged the truth of the charge; but with this saving clause, that the sault must lie principally, if not entirely, in the understanding of the reader. He had no suspicion of his own, and was satisfied with being understood by the illuminated sew. He did not seem ambitious of general same; and in the second book, chap. 4, sect. 43, of his Treatise on "the three Principles of the Divine Essence," he admonishes the reader, "if he be not returning, like the prodigal, to his father, to leave his book, and not read it." "It will (says he) do you harm.—If you love and take solace and delight in the fost delicacies and soothing charms of the sless, I warn you not to read my book; but if you will not take warning, and should fall into a mischievous snare, I shall be acquitted L 14

66 of all guilt, and the blame will fall wholly on your own 66 heads."

This was fair dealing indeed, and favours but little of the zeal of a reformer. But however indifferent Jacob was to the applause of the multitude, yet he seems to have derived great pleasure from a persuasion, that his writings would be better understood, and the principles of them more generally adopted, in some future period. His want of a more active zeal in propagating his tenets, was suitable enough to that gloomy spirit of mysticism, which, by an inexpressible introversion of all the mental faculties, seeks its chief happiness in an abstraction from all outward objects, in a deep and silent repose of the passions, and in a passive submission to the will of God. This they call self-annibilation; and in this they seek that quintessence of the supra-sensual life (as they term it), which no buman language can define, and of which no common under-

standing can form any adequate idea.

The obscurity of our Teutonic Philosopher's writings hath led many to conceive very different, and even opposite, opinions of his understanding. Some hastily concluded from it, that his writings were destitute of any meaning at all; and others, with as little judgment, inferred, that they had a meaning profoundly excellent, and only to be discovered by men of the most enlightened understandings and the acutest penetra-We think both these conclusions wrong. We have read whole pages of his writings without finding ourselves much embarrassed about their meaning. That meaning hath frequently been just and rational, but seldom so prosound or excellent as to excite any great degree of admiration. We have also made a trial of some of the more intricate parts of his writings; and have often been mortified to find, that the discovery we have made hath so little recompensed the toil we have taken. After having bestowed the same attention on one of Jacob's chemico-metaphysico-theological problems, that we have heretofore bestowed on one of Euclid's, we have been chagrined to think, that we have wasted our time, and racked our brains, on some very common and trifling sentiment, which, expressed in plain language, would have been intelligible to a child.

What chiefly contributes to the obscurity of Behmen's writings, is the forced and unnatural application which he so frequently makes of chemical terms to metaphysical and theological subjects. He mixes together the most heterogeneous qualicies;—considers harshness in fruit as the same thing (in what he calls the principle) with anguish in a spirit;—applies fire to the saul, in order to analyse its faculties, in the same manner has a chymist makes use of it in his elaboratory to reduce bodies by their original elements;—and running into all the extrava-

gances of the alchymists and cabbalists, he finds out the similitude of God and the prima materia, in the word fulphur, and we know not what "horrible essences" in the word mercury: and to make all the absurdities of every bastard-science meet as in a common centre, our Jacob hath united the dreams of the astrologists with the whimsies of the Rosicrusians and the visions of the mystics; and thus shewn the world, that there is a certain connection (though difficult to be described) between the different species of nonsense; and that the mind which loves to wander in the mazes of a dark and mysterious theology, will never be satisfied with any philosophy but what is equally intricate and obscure.

We hope these reflections will not be deemed either useless or impertinent. We were naturally led into them by the subject of the present article; of which we proceed to give a more particular account.

To these Memoirs the Translator hath prefixed an introduction, which, though professedly written in favour of the mysic authors, and particularly of Jacob Behmen, is not wholly destitute of good sense, and gives us moreover a favourable opinion of his piety and candour. We have no doubt of Mr. Okely's sincerity; and though the writings of his favourite Author can afford us little improvement or consolation; yet to him they may afford a larger degree of both, than possibly he might find his disposition calculated to receive from the most rational and judicious compositions of ancient or modern wisdom.

The Translator stands not single in this nation for a warm attachment to the writings of this extraordinary and original Mystic. Among the chief of his modern disciples we may rank the late ingenious and pious Mr. William Law, who studied his works with unwearied attention, and on all occations recommended them as the purest resources of all that is sublime in divinity and excellent in philosophy. Mr. Okely gives a catalogue of the publications of our British Theosopher; in which those of his German master are quoted and recommended, with references to the pages where the quotations, &c. are to be found. In a note (p. 105.) we are presented with the following anecdote respecting Mr. Law's first conversion to mysticism, and the steps by which he made such a progress in it.

In a particular interview (says Mr. Okely) that I had with him a sew months before his decease, in answer to the question, When and how he first met with Jacob Behmen's Works? he said, that he had often respected upon it with surprise; that although, when a curate in London, he had perhaps rummaged every bookseller's shop and book-stall in that metropolis, yet he never met with a single book, or so much as the title of any books of J. B.'s, The very first notice he had of him was

from

from a treatise called Ratio et Fides; soon after which he lighted upon the best and most complete edition of his Works, When I first began to read him (says he), he put me into a perfect sweat. But as I discovered sound truths, and the glimmerings of a deep ground and sense, even in the passages not then clearly intelligible, and sound myself, as it were, strongly prompted in my heart to dig in these writings; I followed this impulse with continual aspirations and prayer to God for his help and divine illumination, if I was called to understand them. By reading in this manner again and again, and from time to time, I perceived (said he) that my heart selt well, and my understanding opened gradually, till at length I sound what a treasure was hid in this field." What (says the Translator) I here relate, is, as much as I can remember, certainly the sense, and nearly the very words, of this great and chosen man.

From this circumstance, however, Mr. Okely, in his zeal for Behmenism, draws a very delusive and unsatisfactory inference, viz. When such a man [i. e. as Mr. Law], without any regard to his own reputation and character among men, and merely for the promotion of truth, takes a turn like this, hazarding thereby all that could be near and dear to him; there must be furely fomething more at bottom than what common eyes can penetrate.' Mr. Law's conduct was a strong proof of his own fincerity; but it can by no means be exalted into a convincing argument for the truth of his principles. Many instances of persons affected in the same manner as Mr. Law, and acting with the same disinterested spirit, might be produced from the annals of every Christian sect, and almost of every religion in the world. All make their partial appeals to their more extraordinary and heroic votaries; but truth appeals to something more independent of human prejudices, and will not be judged of by the accidents of profession, but by the unvarying light of reason and evidence.

The Memoirs of the Life, &c. of Jacob Behmen, of which Mr. Okely hath presented the public with a Translation, were originally written by Abraham de Frankenberg, in the year 1651. This biographer was personally acquainted with the subject of these Memoirs, and had heard, from his own mouth, some particular accounts of his spiritual experiences. Frankenberg indeed appears to have recorded Jacob's mystical reveries, not only with the scrupulous exactness of an historian, but with all the solemn gravity of a believer. He doth not merely recite, he attempts to reason; but, as might be expected, the reasoning is such as exactly suited the recital. Let a man admit of the fact, he could not avoid arguing on it like Abraham de Frankenberg.

We

We learn from these Memoirs, that 'Jacob Behmen was born in 1575, at Old Seidenberg, formerly a market-town, about eight or nine [English] miles distant from Goerlitz, in Upper Lusatia. His father Jacob, and his mother Ursula, were both of them poor mean peasants of the good old German stamp; and having been the issue of a Christian and undefiled bed, and born into the light of this world, they gave him the name of Jacob, i. e. a supplanter (as the event was to verify) of the Esau birth. Thus Jacob's nativity was cast by an Old-Testament diagram: and he who thus records it, takes care also to inform us, that at the time when these precious Memoirs were penned, Sol was in Libra. It was right for the biographer to note this asserble tram Shandy's, by the cabalistic virtue of names, but also by the concurrence of sydereal influences.

From these Memoirs we learn, that Jacob was early in life bound apprentice to a shoemaker; and that having served his time saithfully and reputably, he travelled for a while, in order to learn experience in his business. On his return, he married in 1594, a young woman of the city of Goerlitz, with whom he lived in great comfort thirty years, and by whom he had issue

four fons.

Jacob was favoured, when a boy, with some apocalpptical visions, which lest a strong impression on his imagination, and (which was of infinitely higher consequence) produced a moral effect on his disposition and conduct. He early abandoned the sollies of the world, and soon laid a foundation for that strictness and regularity of behaviour, which was always an exemplary part of his character.

The diligence with which he pursued his business, did not preclude him from the enjoyment of a second visitation of that extraordinary power which had, some years before, kept him in a continued ecstacy for seven days, in which (as he informed his biographer) "he stood possessed of the highest beatistic vision

of God."

As he made so good a use of his raptures, he had a renewal of them vouchsafed to him in the year 1600, then in the 26th year of his age. At that time (to use the words of Frankenberg) he was "enraptured a second time with the light of God, and with the astral spirit of the soul, by means of an instantaneous glance of the eye cast upon a bright pewter dish (being the lovely fovialist shine or aspect), introduced into the innermost

<sup>•</sup> Jewialift, an aftrological allusion. This is another instance of that strange mixture of metaphysical and chemical terms to which the ingenuity and learning of Paracelsus, and, after him, of our English Findel,

innermost ground or centre of the recondite, or hidden nature. We are informed that Jacob kept the secret to himself for several years; but at last the seed, which had long pullulated in his heart, burst forth; for being unable to contain it any longer there, by an interior cultivation, he permitted it to spread itself abroad to outward view. This resolution was indeed the effect of a third visitation of the heavenly light in the year 1610. In order then not to let a favour and grace so great as this now imparted to him, had been, slip out of his memory, and not to prove refractory against a tutor so holy and comforting, he set pen to paper (yet only for himself), with inconsiderable helps, and furnished with no books at all but the

Holy Bible.'

In the year 1612 he wrote his first book, to which Dr. Balthazar Walter (who travelled over half the world in quest of the Philosopher's Stone) gave the title of Aurora \*. This book having been entrusted with a gentlemen of rank, was transcribed with great eagerness, and esteemed by many as a recondite treasure of the true and radical philosophy of God and nature,-matter and spirit! As it contained something very novel, at least in appearance, if not in reality, some of the clergy pretended to be alarmed. In the first class of complainants, and among the loudest and siercest of the whole pack, was a certain clergyman of the name of Ritcher, the principal of the church at Goerlitz. He vociferated from the pulpit, in the deep and dreadful howl of orthodox fury, the vengeance of both worlds against poor Jacob, - who, if he was a heretic, was the most harmless of all heretics; for writings, which few can understand, are not calculated to do injury to many. This zealous divine cited Jacob before the senate; who, in order to put a stop to all innovations in the beginning, and quell a contention which might, if permitted to proceed farther, end in something worse than the rage of a priest, and the fanaticism of a shoemaker, took the obnoxious book into their own custody; and after prudently admonishing the author to leave off scribbling, and mind his own business, the matter ended, and the peace of the pulpit was happily restored.

For the space of seven years Jacob's pen was at rest, keeping, as it were, a silent sabbath! After that period, he had

Fludd, gave some credit. The pewter-dish is here represented as the medium of the divine influence; and the light reslected from it is called the Jovialist shine, because Jupiter or Jove was the astrological or chemical representation of tin, of which metal pewter chiefly consists. Rev.

Or "morning redness at sun-rist," as Behmen himself called it.

(as his biographer informs us) a fourth stirring of the ground divinely laid in him, strengthened and roused with superabundant grace. Admonished by others not to bury in the earth a talent and trust of so high and precious a nature, he resumed his pen in the name of God; and in the progress of his writing, did very leisurely, and without distraction (for he had no stock to prosecute his own business with), write those glorious and excellent pieces, which will last as long as the world endures.' These pieces are enumerated in the present Memoirs; and we find, that this extraordinary man, in the space of six

years, produced no less than thirty different treatises.

This remarkable person having visited, for some weeks, a gentleman of distinction in Silesia, was seized with a sever at his house; and, by drinking an immoderate quantity of water, was swelled to a surprising degree, and at the same time encreased the force of his disorder. Yet in this condition he was folicitous to be carried to his own home at Goerlitz, that he might have the satisfaction of being attended by his family. particular account of his last sickness, and some curious circumstances relating to his death and burial, are collected together from different authors, and make a part of the present publication. His friend Dr. Koeben attended him in his illness; and after giving a particular description of it in a letter to some gentleman of distinction at Horndorf, he gives an account of the examination their admired Jacob was obliged to fubmit to, before an impertinent curate called Theodore would vouchsafe to administer the holy sacrament to him. This was a mortifying circumstance, especially to those prosound adepts in the occult sciences, who had been taught to look up to Jacob as their master, and probably looked down with contempt on the curate, as an officious and empty coxcomb. But the meek man submitted to the clerical imposition with great patience and humility; and having satisfied this pretended judge of orthodoxy as to the rectitude of his views and principles, he received the facrament with great devotion, and departed this world with all the ferenity of a virtuous and holy spirit, on Sunday the 17th of November 1624.

It was with great difficulty that the friends of the deceased could procure a burial for him according to the rites of that country. The clergy extended their malice even to the ashes of this harmless man, and positively resused to officiate at his grave, and pay him the decent honours of a departed Christian, till the magistrates interposed, and insisted on their due performance of the suneral rites established by the laws of their senate. Notwithstanding this injunction, poor Jacob's obseques were but imperfectly performed. [The preacher, who was appointed to the sermon, apologised for his having been

obliged.

obliged to undertake so disagreeable a task. He wished himself at the distance of a hundred miles, rather than officiate at the grave of a Jacob Behmen; but fince he only preached by confiraint, he was determined to preach a sermon that Jacob's friends would not be disposed to thank him for.

The grave of this good man was infulted, and his monument (fent 'from Silesia as an honorary memorial to his name')

was mutilated, and treated with every mark of indignity.

The Translator of these Memoirs appears to have made the mystic writers of Germany his capital study. He informs us, that he hath translated Peter Poiret's mystic Library, and Theophilus's Germanic Theology, from the Latin. Many treatises of the same stamp he hath also translated from the German; particularly "The evangelical Conversion of Dr. John Thaulerus at the Age of 50 Years, drawn up by his own Hand;" and "a complete Narrative of God's wonderful Dealings with Hiel,"—a remarkable mystic writer, who appeared about 1550 in the Netherlands, and whose writings were patronised by that learned Hebraist Benedictus Arius Montanus, and whose works were published in the original Low Dutch by that celebrated printer Christopher Plantin.

Hiel indeed was only the mystical Hebrew name given him by Montanus, and signifies The Life of God. His real name was Henry fanson, a clothier by trade, of whom Mr. Okely hath given a short account in a Postscript to these Memoirs, and informs us, that he gathered the chief particulars of this extraordinary man from Poiret's Library, and Arnold's Ecclesiastical and

Heretical History.

Though the curious may be gratified by the biographical anecdotes of such extraordinary mystics as Thaulerus and Hiel; yet we think plain primitive Christianity will receive little advantage from the spiritual reveries of writers, whose chief characteristic is obscurity and consusion.

### ART. IV.

First Truths, and the Origin of our Opinions explained. With an Inquiry into the Sentiments of modern Philosophers relative to our primary Ideas of Things. Translated from the French of Pere Bustier. To which is prefixed a Detection of the Plagiarism, Concealment, and Ingratitude, of the Doctors Reid, Beattie, and Oswald. 8vo. 6s. Boards. Johnson. 1780.

FTER the immortal works of LOCKE, CLARKE, and BUTLER, our country might well have dispensed with a translation of the metaphysics of Father Buffier. They will add very little to our knowledge of the intellectual world; for the bon pere, in order to establish his "first Truths," hath run in-

to vulgar errors; and wanting strength of mind to unfold the deep and obscure recesses of human nature, he slies to mystery as a refuge for ignorance; and when he finds himself bewildered, he declares that his subject is incomprehensible.

This performance may be very acceptable to those who are fludying the elements of metaphysics. Profound adepts may possibly esteem it too superficial for them. The learned Jesuit doth not always reason with solidity. He dwells on common-place arguments; and even these are not placed in the most advantageous light. The third part, containing, "First Truths relative to Spiritual Beings," is a remarkable instance of trite, desultory, and unsatisfactory reasoning. Take the following specimen:

Physical proofs of the immortality of the soul are deduced from this consideration, that with all our powers of knowledge and reason, we can discover no subject or principle of destruction in it: for, in short, we know of no destruction but what is occasioned by a change or separation in the parts of a whole. Now, we not only do not discern any parts in the soul, but sarther, we positively see that it is a substance persectly one, which has no parts.

- We have observed in speaking of unity, that it is a quality not strictly applicable to a body: That whatever is body is not said to be one, but in an arbitrary respect; and it is in such a manner one, that at bottom it is no more than a collection of several unities, each of which cannot properly be called one. Let us take a watch, for example; we cannot see any thing in the body that hath more unity; for if the least of its parts happens to be wanting, it is no longer a watch, properly speaking. Yet what is this unity but a collection of distinct things and parts? Touch the pendulum, and you do not touch the wheel. Had they sentiment or feeling, the pendulum might be sensible of pain, or be unhappy, while the wheel should enjoy pleasure, and be happy, without either feeling what the other did.
- It is not the same with regard to the soul, which is so far one, that I cannot make impressions on what I might imagine to be one of its parts, without making impression on what I should sancy to be another part of his substance: or, to speak more justly, an impression cannot be made on its substance, without being made on the whole of its substance.... I may impress a colour on the wheels that shall not affect the pendulum. In the soul, on the contrary, one part must necessarily be the other; and to speak more properly, the soul must have no parts; for while we suppose parts in it, whatever makes an impression on one part of the soul, necessarily makes an impression on the whole soul together.

After more of this fort of argumentation, illustrated by fome futile comparisons, F. Bustier recurs once more to his favourite conclusion, viz. that 'as the soul hath been demonstrated to be one and simple, without parts and composition, (ergo) there can be no principle of destruction in souls, and we have no room to

judge that they are liable to perish or be destroyed.'

The good Father's logic as little befriends him, when he quits the metaphyfical for the moral argument, and would deduce the foul's immortality from the infinitude of its defires. • If (fays he) my foul be mortal, the most rational defire I have will never be accomplished. Now this defire is imprinted on my heart by the Author of my existence, who thereby indicates my future destiny. God would therefore have placed in me a defire that must only tend to give me regret and pain: he would have placed in me a false indication of my destiny, and deceived me in the most effential article of my life, which is inconsistent with the truth, wisdom, and purity of God. cannot therefore conceive the existence of a good and wise God, who is our Author, without conceiving, at the same time, that our fouls must exist after this life, in order to arrive at that happiness with the desire of which he hath inspired us; for it is certain we do not possess it in this life, even by wisdom and virtue, that should lead us to it. In a word, if the soul were mortal, God would not have acted with the wisdom and equity that are effential to his nature, and without which God would not be what he really is. The existence of God, therefore, is a proof of the duration of our fouls after this life.' The good Father had not penetration enough to fee to what dangerous conclusions such arbitrary and presumptuous reasonings as these naturally lead, and what a handle they would afford the Atheist, to contest the doctrine of Providence, and the very attributes of God himself. Can any mode of argument be more absurd and inconfistent than that which would establish the proof of a future state on the wretchedness and impersection of the present? -or than that which represents the Deity as neglectful of the interests of virtue in this life, in order to demonstrate how greatly he will reward it in another?-Would any one prefume to fay, that the Deity might not have wife and benevolent ends to answer by the creation of an order of rational beinge, whose existence might be limited to a certain period? Suppose the great Sovereign of the universe did think proper to extinguish any part of the intelligent creation, would any being have the insolence to arraign his justice, his wisdom, or goodness, and blasphemously tell him, that 'if the soul were mortal, he had not acted with the wifdom and equity that are effential to his nature?'-According to the reasonings of the learned Jesuit, such language language might be used, were such an event to take place, even

in the most distant ages of futurity.

F. Buffier, though he hath exceeded all the bounds of modesty and humility in the foregoing quotation on the necessity of the soul's being immortal, in order that God may be wise, just, and good; yet modestly and ingenuously observes, 'that it is learning a great deal, to see distinctly we can acquire no knowledge of certain matters (viz. about spiritual beings); and that all we might have learned of them may or ought to be forgotten, as incapable of giving satisfaction to a rational mind.'

It is (continues the good Father) the most solid fruit, perhaps, of metaphysical knowledge, to make us fully sensible of the limits of our understanding, and of the vanity of so many ancient and modern philosophers, who have thought it better to use a language that is incomprehensible, than to repress the ridiculous ambition, and the dangerous vanity of saying things,

that neither are, nor can be understood by any person.

Though there are many valuable observations in this work, yet F. Bussier staters himself too much when he says, 'that he hath been careful to admit as notions none but clear and precise ideas; and to acknowledge no principles but the judg-

ments adopted by common sense."

As to the Translator's Preface, though it is not destitute of Threwdness, yet it is so grossly illiberal, that we remember not to have read any thing so offensive to decency and good manners, even in the rancorous productions of some of the late controvertists in metaphysics. The Writer hath exceeded Dr. Priestley in his abuse of the Scotch Doctors; but with a larger quantity of that author's virulence, hath unluckily too small a portion of his ingenuity and good fense, to recompense for that shameful affront to candor and civility which is too flagrant in every page to escape the notice or indignation of any unprejudiced reader. - One specimen of it will be sufficient - Of later years the Transtweedian regions have swarm'd with a new species of men, different from their itinerant pedlars in the wares they fell, but fimilar in the manner of packing them together from the labours of others. These are writers, or rather book-makers, " who obtain but a mediocrity of knowledge between learning and ignorance;" for such is the opinion of an author, whose opinion to judge, and whose candour in decision; deservedly place him above the suspicion of being inadequate or unjust in the sentence he hath pronounced.' And vet, notwithstanding this insidious resection, the world (not Scotland only) will number Hume, Robertson, Smith, Blair, BEATTIE, and Lord KAMES, among the first ornaments of genius, taste, and erudition.—But as for this writer of prefaces, and retailer of literary slander-who is be?

Appendix to the State of the Prisons in England and Wales, &c. By John Howard, F. R. S. Containing a farther Account of foreign Prisons and Hospitals; with additional Remarks on the Prisons of this Country. 4to. 2 s. Warrington, printed by W. Eyres, and fold by Cadell and Conant. 1780.

which could never be more characteristically applied, than to the Author of this work. Having repeatedly visited the prifons in England, and seen the methods of treating prisoners in many foreign countries, and having obtained for the prisoners of this country, both insolvent and criminal, legal relief from many hardships, Mr. Howard still entertained the benevolent design of rendering further services to this numerous and unhappy part of the community, and determined to undertake another tour abroad, with the view of collecting sarther hints for the regulation of prisons, and the management of prisoners. The fruits of this tour are here offered to the public; and the Writer's observations are not less interesting or accurate, than those which he made in his former journies. The countries visited in this tour, are Holland, Germany, Italy, Switzerland, and France.

From Mr. Howard's account of Rome we shall select the sol-

lowing particulars:

In this city, and many others in Italy, is a Confraternita della mifericordia, called S. Giovanni di Piorentini. It confifts of about feventy, chiefly nobles, of the best families. After a prisoner is condemned, one or two of them come to him the midnight before his execution, inform him of the fentence, and continue with him till his death. They, with the confessor, exhort and comfort him, and give him his choice of the most delicious food. All the fraternity attend the execution, dressed in white. When the prisoner is dead, they leave him hanging till the evening; then one of the fraternity, generally a prince, cuts him down, and orders him to be conveyed to the burying-place which they have appropriated to malesactors. I was there the twenty-ninth of August, the only day in the year when this burying-place is opened to the public.—Adjoining an elegant church is a chapel, which makes one side of a court, and on each of the other three sides, is a portico supported by Doric pillars. In the middle of the pavement + of the front portico the suemen, and in one of the side

† Here are marble squares, in which are circular apertures for the interment of those that are executed. Round these stones is inscribed,

porticos

<sup>•</sup> Many of Florentime extraction were the founders. This infitution is ancient, for the church of S. Gio. Battifia Decellate belonged to them in 1450.

<sup>\*\*</sup> Domine, cum veneris judicare,

\*\* Noli nos condemnare."

O Lord, suben thou fealt come to judge,
do not condemn us.

porticos the men, are buried. The latter are interred in the fame drefs in which they were hanged; for in Italy coffins are not in general use.

The hospital of S. Michele is a large and noble edifice. The back front is near three hundred yards long. It consists of several courts with buildings round them. In the apartments on three sides of one of the most spacious of these courts, are rooms for various manusactures and arts, in which boys who are orphans or destitute are educated and instructed. When I was there, the number was about two hundred, all learning different trades according to their different abilities and genius. Some were educated for printers, some for bookbinders, designers, smiths, carpenters, taylors, shoemakers, and barbers; and some for weavers and dyers, a cloth manusacture being carried on here in all its branches. When the boys arrive at the age of twenty years, they are compleatly clothed, and a certain sum is given to set them up in the busness they have learned. In the middle of the court is a noble sountain, and there are several inscriptions to the honour of the founders of this excellent institution.

I joining to another court are apartments for the aged and infirm, in which were two hundred and fixty men, and two hundred and twenty-fix avenue. Here they find a comfortable retreat, having clean rooms and a refectory. I converted with some of them, and they ap-

peared happy and thankful.

Another part of this hospital is a prison for boys or young ment

Over the door is this infcription:

CLEMENS XI. PONT. MAX.
PERDITIS ADOLESCENTIBUS CORRIGENDIS
INSTITUENDISQUE
UT QUI INERTES OBERANT
INSTRUCTI REIPUBLICÆ SERVIANT
AN. SAL. MDCCIV. PONT. IV.

Pope Clement XI.
For the correction and instruction
Of prostigate youth:
That they, who when tall were injurious,
When instructed, might be useful,
To the State.
1704.

In the room is inscribed the following admirable sentence, in which the grand purpose of all civil policy relative to criminals is expressed:

PARUM EST
COERCERE IMPROBOS
POENA
NISI PROBOS EFFICIAS
DISCIPLINA.

It is of little advantage
To refirain the Bad
By Punishment,
Unless you render them Good
By Discipline.

Mm'z

'Here were fifty boys spinning, and in the middle of the room and inscription hung up,
'silentium.

In this hospital is a room also for women. On the outside is an inscription, expressing that it was erected by Clement Xil. in 1735, for restraining the licenticusness and punishing the crimes of women.

In Naples, Mr. Howard relates, that the hospitals have wards appropriated to the cure of wounded persons; on which fact he

makes the following judicious observations:

"The frequency of affaults and affaffinations in Italy is generally known. Many of the common people feem to be infensible of the atrociousness of the crime of murder. I have heard criminals in prifon express, with seeming satisfaction of mind, "that though they stabled, they did not toh." If we consider that wards and even hospitals appropriated to the wounded are filled with patients, that the prisons are crowded, and that many are continually taking refuge on the steps of churches, and examine our accounts in Jansen's Lists and the Judges' Resurns, we may reckon that there are more murders committed in a year in the city of Naples or Rome, than in Great Britain and Ireland. Does not this prove that the English are not naturally cruel? And might not arguments be derived from hence, for the revisal and repeal of some of our sanguinary laws? The Marquia Beccaria justly remarks, in his Essay on Crimes and Punishments, chap. 288 "That the punishment of death is pernicious to society, from the example of barbarity it affords."

In the account of Munich we meet with the following de-

scription of a black torture-room in one of the prisons:

"In this room there is a table covered with black cloth and fringe. Six chairs for the magistrates and secretaries covered also with black cloth, are elevated two steps above the floor, and painted black. Various engines of torture, some of which are stained with blood, hang round the room. When the criminals suffer, the candles are lighted; for the windows are flut close, to prevent their cries being heard abroad. Two crucifixes are presented to the view of the unhappy objects. But it is too shocking to relate their different modes of cruelty. Even women are not spared.—This room seems very much like the torture room in Spain, described in Limborch's History of the Inquisition, translated by Chandler, vol. II. p. 221, 4to edit. "was a large under-ground room, arched, and the walls covered " with black hangings. The candlesticks were fastened to the wall, " and the whole room enlightened with candles placed in them. "The inquisitor and notary sat at a table, so that the place seemed as " the very mansion of death, every thing appearing to terrible and " awful."

Similar to this is the following account of the prison at Liege:

, In two rooms of the old prison I saw six cages made very strong with iron, four of which were empty. These were dismal places of

The dimensions were seven feet by six seet nine inches, and fix feet and a half high. On one side was an sperture of six inches by four, for giving in the victuals.

sonfinement; but I soon sound worse. In descending deep below ground from the gaoler's apartments, I heard the moans of the miserable wretches in the dark dungeons. The sides and roof were all stone. In wet weather, water from the fosses gets into them, and has greatly damaged the sloors. Each of them had two small apertures, one for admitting air, and the other, with a shutter over it, strongly bolted, for putting in food for the prisoners. One dungeon larger than the rest was appropriated to the sick. In looking into this, with a candle, I discovered a chimney, and selt some surprize at this little escape of humanity from the men who constructed these cells.

The dungeons in the new prison are abodes of misery still more shocking; and confinement in them so overpowers human nature, as sometimes irrecoverably to take away the sease. I heard the cries of the distracted as I went down to them. One woman, however, I saw, who (as I was told) had sustained this horrid confinement forty-

seven years without being distracted.

The cries of the sufferers in the torture-chamber may be heard by passengers without, and guards are placed to prevent them from stopping and listening. A physician and surgeon always attend when the torture is applied; and on a signal given by a bell, the gaoler brings in wine, vinegar, and water, to prevent the sufferers from expiring.—
"The tender mercies of the wicked are cruel." Thus in the Spanish inquisition, the physician and surgeon attend to determine the utmost extremity of suffering without expiring under the torture.

I will only add, that in this prison there are rooms appropriated to prisoners en pension; that is, to such as are confined by the magistrates, at the defire of their parents, guardians or relations. A shocking practice! which prevails also in some of the neighbouring

countries.

'In the Maison de Farce there were ninety prisoners, ranged in four rooms, and employed in a woollen manufactory of linings for soldiers clothes. Persons live in the house who well understand the business, and instruct the prisoners in sorting, carding, spinning, twisting, and weaving. None of them were in irons. All had separate beds, and were supplied with good rye bread—meat three times a week,—two quarts of beer, for each, every day,—and soup every other day †.'

To this narrative of his last foreign tour, Mr. Howard subjoins an account of the present treatment of the prisoners of war in this country, and adds many new particulars respecting the

prisons in England, Scotland, and Ireland.

vol. II. p. 222.

<sup>\*</sup> See Chandler's Translation of Limborch's Hift. of the Inquisition,

<sup>+</sup> The chaelain, who lives in the house, favoured me with his company through the work-rooms, lodging-rooms, and the resectory. He entered into the true spirit of this institution, and lamented the inconvenience of the house, as not being built for the purpose to which it is applied. He took notice of the propriety of solitary confinement for those that were riotous and refractory at their first coming; for generally, he said, "in four or five days they would become very tractable and submissive."

We cannot take our leave of this meritorious work, without expressing an earnest wish, that the Author may have the satisfaction of seeing his benevolent designs fully accomplished, by the wise and humane interposition of the legislature. Such a recompence will, we are persuaded, be more acceptable to hims than any encomium which can be passed on his merit. Yet it is impossible to contemplate these labours of humanity with any portion of that spirit which distated them, without paying a tribute of cordial applause to

"This friend to human kind, this patriot of the world."

E,

## ART. VI.

The New Art of Land-measuring; or, a Turnpike Road to Practical Surveying: Leading to a new and exact Method of measuring and mapping of Lands, Woods, Waters, &c. by the Catoptric Sextant; and to cast up the same by the Pen only. Also, to many new Discoveries in laying out, dividing, and reducing of Land; to levelling for the Conveyance of Water, either in Pipes or open Cahals. Together with an Appendix, containing a new Theory of the Catoptric Sextant, and its farther Use, in an entire new Merthod of taking Heights and Distances, independent of Trigonometry: Also Measuring of standing Timber. To which are added several new and useful Tables. The whole illustrated with Copperplates. By B. Talbot, Teacher of the Mathematics at Cannock, 8vo. 6s. bound. Lowndes.

THIS book is divided into fixteen sections; and an Appendix is added, containing five sections more.

In the first section, Mr. Talbot lays down some geometrical definitions (in his own way); and in the second he gives rules for the construction of such geometrical problems as he conceives may be useful to the practical surveyor, either in taking the dimensions, plotting, casting up, or dividing of land. In this section, as well as the former, our Author is not in the least solicitous whether his method be or be not truly Euclidean: neither can the admirers of Euclid's manner express more contempt

for Mr. Talbot's method than he does for theirs.

In the third section, he gives the description and use of a new catoptric sextant (as he calls it) or improved Hadley's quadrant, in the art of land-measuring. Mr. Talbot is very warm in his praises of this most excellent instrument; and as it is impossible either for him, or any one else, to be greater admirers of it than we are ourselves, and that on the justest grounds—a long and successful use of it, in making the most delicate observations to which it can be applied—we entered on this section with the utmost avidity, in consequence of the words in the title of it which we have put in Italics. Judge then, reader,

If you can, how great must be our disappointment, to find that the instrument which he describes is of the most common and ordinary kind; and that the improvements he speaks of confift in having increased the arch to a fextant, or 1200, and adding a spirit level, for the purpose of finding the horizon at land—things which were done by others thirty years ago at least! All the improvements which later aftronomers and instrument-makers have been so affiduously making to it, appear to be utterly unknown to Mr. Talbot; and his intimacy with the instrument in its present improved state, will readily be judged of, from his afferting, as he does, that a radius of 12 inches is too small to admit of its shewing minutes; whereas every one who is acquainted with the fextants which have been lately made by Mr. Ramsden, and other good artists, know that a radius of 4, and even of 3 inches, is fully sufficient to do this. Neither does Mr. T. appear to be acquainted with all the adjustments which are required to be made to this instrument, when exactness is sought in the observations.

Mr. Talbot farther informs us, that he believes thus extending the arch, and the application of the inftrument to the purpose of surveying, were both of them first thought of by himself; and he brings, as a proof of it, an advertisement which he inserted in the Birmingham Gazette, in 1763. But if he will consult the Second Letter of the late Rev. Dr. James Bradley, Astronomer-Royal at Greenwich, printed at the end of Mayer's Solar and Lunar Tables, in 1767, he will find that sextants were not uncommon instruments in the years 1758 and 1759, which is four or sive years before the date of his invention; and it is highly probable that they were made use of se-

veral years before the period here spoken of.

As to the application of the sexant to the purpose of surveying, we may observe, that the Inventor himself, in the very paper in which he announced his discovery to the public, speaks of it as being applicable to measuring angles in every direction whatsoever, and that with equal facility: consequently the mensuration of angles in surveying is included. We can also assure him, from our own knowledge, that it was actually used in the practice of surveying, before the year 1763, by several persons, who, although they were, and some of them yet are; really great mathematicians, thought so little of the matter, aster what had been said by Mr. Hadley himself on the subject, that instead of letting it smake its way through all the academies in Europe, they did not even advertise it in the Birsmingham Gazette.

<sup>\*</sup> See p. 150 of the Turnpike Road to Practical Surveying.

M m 4

In the fourth section he describes the chain, the off-set-staff, and the arrows, as they are usually called by surveyors; and instructs his readers in the methods of measuring from one object to another in a strait line, either on a plain, across a valley, over a hill, or where the passage between the two objects is obstructed by a piece of water, a wood, or any other object, that may be passed by turning a little out of the direct line. He then proceeds to shew how to erect a perpendicular to any straight line in a field, by the chain only. It does not appear that even Mr. T. himself thinks that this section contains any thing new; because if he had, we are certain he would have told us of it.

In the fifth section he describes the protractor and plotting-scales, and shews their use in laying down angles and lines of

an assigned magnitude.

The fixth fection shews how to take the dimensions of, cast up, and plot right-lined figures, by most of the methods in use; as by the chain alone, by measuring the several sides, and such other lines as are necessary to determine the species of the figure; which method he justly reprobates: by the plane table, the theodolite, and the chain and cross-staff. And here be strongly recommends the fextant, for erecting a perpendicular, in picference to the cross. We think differently; but, De gustibus non est disputandum.—He then proceeds to give what be calls a new method, namely, by measuring the several distances from some convenient point within the field, to each of the corners, by the chain, and measuring the angles contained between them by the fextant. And in order to determine the areas of the several triangles into which the field will by this means be divided, he multiplies the product of the two containing fides, by half the fine of the angle which they contain. This method he very justly recommends, as being greatly preferable to every one else; and lays claim to it as his own, declaring that he never faw it in any author, or practifed by any furveyor, until he used it, and taught it to his pupils and others. Accordingly, as this is a new method, and not known to any persons but those to whom the Author has communicated it, and therefore the truth of it disputable; he has, contrary to his ordinary custom, given a formal demonstration of the theorem. Who, after this, would suppose, that the theorem is a very common one, and to be met with in most authors of reputation who have written on similar subjects? For instance, Jones's Synopsis Palmariorum, p. 237. Emerson's Trigonometry, 1st Edit. b. II. sect. I. prop. 13. and more particularly, chap. XIV. of Wilson's Surveying, dedicated to the late Dr. Halley; where the same theorem is demonstrated, and as warmly Marmly recommended to the practical surveyor, as it is by our Author himself. Wilson has even made more of the matter than Mr. Talbot has done; for he has directed the artist to find the areas of the several triangles by logarithms, to the practice of which this theorem is most happily adapted; and by them the area of any triangle may be found in one sourth part of the time that it can be found without. The truth is, the theorem was well known many centuries even before Wilson's time, and may be met with in several of the ancient mathematicians.

Section 7th is employed in giving directions for surveying, casting up, and plotting circles, ellipses, and other curvilineal and mixt-lined figures. And in this section the Author has given many curious and pertinent remarks, relative both to taking the dimensions, casting up the contents, and plotting

the figure.

In the eighth section he shews the method of measuring, casting up, and plotting a number of inclosures which lie contiguous to one another; such as a farm, parish, lordship, &c. and demonstrates, that those surveyors are mistaken, who suppose that no instrument except the plane table will afford a proof of its own work. Mr. Talbot might have added, that there is not any instrument whatsoever, generally used in the practice of surveying, which will not afford more ways (and those at the same time more accurate) of proving themselves than the plane

table will, if we reject the cross.

In the 9th section, he treats of the reduction of hypothenusal lines to horizontal ones; and of reducing mountainous and irregular lands to plains, as is the custom of most surveyors. But, adds Mr. Talbot, 'Authors and surveyors differ in opinion relating to the measuring of hills; some arguing, that no more corn, grass, &c. can grow on a hill, than on the base or flat, if the hill was taken away; for, say they, as many pales fet perpendicularly, as will fence the base or horizontal line, will also fence over the hill. Granted. But the same length of railing that fences the horizontal line, will not fence over the hill; nor does corn or grass grow perpendicular. Suppose the fide AB of a hill, whose inclination to the horizon is 200, and the flope-line, or hypothenuse, 5, 34 chains, and a part of this be cultivated, suppose 2 chains broad, then the area will be 106,800 square links; and suppose it to be sown with onions or carrots, and that they grow at one link (or 8 inches very nearly) distance from each other; then there will be 106,800 onions, or carrots, on fuch a spot. But the horizontal line A D, of such hill, is but 5 chains; and consequently the area for 2 chains breadth will be but 100,000 square links, or just one acre; and will produce only 100,000 onions, or carrots, at the same distance as above. Now the difference of the quantity of onions or carrots on the hill, and on the flat, is 6800; and suppose them worth one penny a dozen, it amounts to 566: pence, or 21. 7 s. 2 d. which sum is sufficient to pay the rent of more than double the whole quantity of land; and plainly demonstrates, that surveyors ought always to give in the area of the convex furface of hills.'

But admitting that corn and grass did grow perpendicularly to the horizon (which, as Mr. Talbot observes, is by no means the truth), yet the quantity of corn or grass which will grow on any piece of land, is not to be estimated by the number of blades or stalks which will stand upright one by the side of another, but by the number which the earth will nourish; and that being evidently as the surface, the quality of the land being supposed the same, it admits not of a doubt, but that it is the furface, and not the horizontal plane, which is to be confidered, even when the quantity of grass or corn which it will produce is alone the point in question. But if it be the tilling, sowing, mowing, reaping, &c. which is the thing to be considered, the whole convex surface is most evidently to be given The fencing is the same in both, except digging for the foundation of a wall, or where the fence is railing, or a ditch ; in which cases, the line drawn along the convex surface is again These points ought to be particularly attended to be measured. to in the mensuration of fences, and particularly where the fences are stone or brick walls, in which cases a very small error will be of confiderable amount. In measuring such fences, either the horizontal length and perpendicular height, or the hypothenusal length, and the height, at right angles to the fide of the hill, are the dimensions that ought to be taken.

The tenth section, on the surveying of common fields, though very short, contains some pertinent hints relative to taking the dimensions of plowed lands; and which shews that the Author

had maturely confidered that matter,

The eleventh section directs how to lay out any given quan-

tity of land in any proposed figure that may be required.

In the twelfth section he treats of the division of lands; a point in which, as he justly observes, very little had been done before him to affist the practical surveyor. He has, however, contrived to mistake that little which had been done, and in consequence, as is usual with him, has thrown out a great many fly strokes of dry ill-natured wit, we suppose he calls it; and for which he has, at the end of his book, been under the necessity of making acknowledgments. It is to the free indulgence of himself in this particular that he must attribute the severity of our remarks.—This fection, notwithstanding, contains a great deal of ingenious and useful matter; and the Author appears to have have availed himself of every hint that has been given relative to it by the writers on elementary geometry.

The thirteenth section relates to the measuring of marl-pits; and we make no doubt but that what he there says concerning the customary manner of proceeding in that business is just.

The subject of the sourceenth section is levelling; in the prosecution of which the Author describes the instruments necessary to it, and the manner of using them, in a very sull and

fatisfactory manner.

The fifteenth section is employed in describing the several methods of reducing plans; in which he supplies several desiciencies in the works of those Authors who have written before him on the subject; and even shows how to make several of the instruments necessary in the practice of that branch of the surveyor's art. And the sixteenth section contains directions for mapping of land, and ornamenting those maps when they are made.

We come now to the Appendix, which is divided into five fections. In the first, he delivers the principles of Hadley's sextant; thews how to adjust most of the errors to which it is subject; and complains of many faults in its conftruction, which we do not remember to have ever feen, even in the most common octants and fextants that are made. We presume it may have been Mr. Talbot's ill luck to have feen but one, beside what he has made himself, and that most likely by a sorry artift, as there are ten bad makers for one whose work is good, People in the country are generally uninformed who are good and who are faulty makers, and therefore they fend to the first they hear of, which, of course, is the man who makes the most noise; and he who does that has very seldom much merit any other way. This having been the case with Mr. Talbot's first purchase, he has supposed all instruments of that kind to be alike, and therefore thinks, because he has improved on that, which perhaps could not be made worse, he has improved upon This, at least, is the most candid way of accounting for those master-strokes of self-approbation which Mr. T. throws out, and the severe sarcasms that he darts on all round him, even when his felf-conceived improvements are at an immense distance, indeed, behind those of his cotemporaries-We have now in our eye what he has faid concerning the Commissioners of the Board of Longitude. Every one may judge of the fextants which Mr. T. calls good ones, when he fays that 'a very good one may be made for a couple of guineas.

In the second section of this Appendix, he gives a great many curious hints towards measuring heights and distances; and directions for measuring both vertical and horizontal angles with the sextant, but most of them in too rude a manner to admit of any very great degree of accuracy;—they may, notwithstand-

ing, be often useful, where the utmost accuracy is not requisite: and the expedition with which they may be put in pracsice will make amends for their defect in point of exactness.

The same may be said of the third section, which relates to
measuring standing timber by means of the sextant: in the prosecution of which he throws out many new and useful hints,
which gave us much pleasure in the perusal; and we greatly
doubt whether standing timber can be measured so accurately
any other way:—we are certain it cannot be done any other
way in twice the time.

The fifth section delivers rules for performing the several operations in mensuration and surveying, by means of the sliding-rule, in which we cannot say that we discovered any thing out of the usual way, any more than we did in the fifth, which is concerned in giving directions for measuring roads.

On the whole, although our Author has shewn himself possessed of much vanity and ill-nature, as well as ignorance of what had been done by others before him, in several of the subjects on which he writes, yet the reader will find that his book contains a great deal of useful information, some new matter, and many ingenious observations, which sufficiently shew him to be a man of genius, and of considerable abilities and experience in his profession.

## ART. VII.

Sarmons on feveral Occasions, preached before the University of Cambridge. To which is prefixed, a Differtation on that Species of Composition. By J. Mainwaring, B. D. Fellow of St. John's College. 8vo. 5 s. Boards. Cadell. 1780.

OST of the Discourses published in the present Volume have been already printed separately. To rescue them from the sate which generally attends single sermons, and to give the Author an opportunity of offering his sentiments on the nature and qualities of compositions for the pulpit, are the chief objects of this Collection.

The Differtation prefixed to these Discourses is sensible and ingenious; and the Notes at the end are instructive and entertaining, the Author illustrating his observations by many curious

examples and pertinent anecdotes.

Mr. Mainwaring very justly censures the late Mr. Gray for his general and injudicious commendation of Sterne's fermons, in one of his letters to Dr. Warton; and his equally injudicious and unguarded reflections on the rational divines since the Revolution, in a letter to Mr. Mason. Nothing indeed but the distinguished name of Mr. Gray could, we think, have justified

justified the learned differtator, in stopping one moment to combat the jejune and uncritical affertions of a hasty letter. But knowing the influence that fuch a name was likely to have on shallow and prejudiced understandings, he very properly at-tempts to controll it, by shewing how faulty and defective the fermons of Mr. Yorick are-especially when considered in the light in which Mr. Gray recommended them, viz. as a model for the pulpit: - and lest Mr. Gray's reflections on the divines fince the Revolution (who are accused by him " for that chapping of logic in the pulpit, which is not the thing") should beget an undue prejudice against their writings, and introduce that flimly style of preaching, which affects to aim at the heart more than the bead, and hath been always the delight of foolish women, and the kind resource of ignorance, and indolence, and vanity; Mr. Mainwaring very accurately discusses the reasons why the forms of strict and solid argument were preserved with fo much care in the fermons of our best divines; and then points out the peculiar advantages which arose from this mode of preaching, in opposition to the sophistry of the Papists, and the enthusiastic and delusive cant of the fanatic sectaries.

The enemies of our faith (fays the Author) were many of them not unprovided with learning and talents, and could not be attacked successfully but by weapons. The argumentative forms of preaching were necessary, to consute sophistry, and to consound irreligion. They did both; and the English were among the first who effectually secured the interests of piety, by uniting it with reason and good sense.

Among those divines who have credited the forms of logical argument, by a most successful employment of them in the cause of revealed religion, our Author justly allots to Dr. Butler, late Bishop of Durham, a most distinguished pre-eminence.

Having vindicated fermons from the reproach which they lie under in general, and suggested some hints respecting those of a particular class, the ingenious Author proceeds, in the hope of contributing somewhat to the success and credit of such compositions, to subjoin a sew observations relative to the conduct of them, under the following heads, viz. Perspicuity—Purity or Correstness—Elegance—Pathos—Piety—Eloquence.

Under the head of Piety, the Author speaks of those errors which are contrary to it. Here he censures those 'preachers who imitate, in their discourses, the dryness of philosophic lectures, the gaiety of polite conversation, or the slippant samiliarity of snip-snap dialogue.' The "dramatic sermons" of Sterne, as he himself chose to term them, are condemned, notwithstanding the acknowledged beauties of some of them, for a gross violation of the decorum of the pulpit, and that 'air of burlesque'

lefque' which appears in almost all of them. Mr. Mainwaring makes the following apology for his free treatment of this admired writer. 'The greater his merits are, so much the more necessary does it seem to point out his faults; and to warn the young and incautious never to court admiration by methods so pregnant with reproach and danger: for if the interests of piety are betrayed by its own guardians, what authority is it like-

ly to retain with the rest of mankind?"

Wit and ingenuity, humour and pleasantry, when free from all sincture of acrimony and ill-nature, add much to the charms of police conversation. They are also a great recommendation in an essential are a pamphlet on any subject of common use; and perhaps may be admitted in some degree on religious subjects—but agoer, I think, in sermons: for this fort of freedom is repugnant to that settled serious which is their characteristic quality; and, if indulged at all, would soon gain the ascendant, as every wrong habit is apt to do. The discourses of Dr. South, which have otherwise so much merit, are very faulty in this particular. It is, however, some excuse, that he lived among wits, at a period too when wit was in high request, after piety had been brought into great disgrace by the nauseous lappuage

of hypocrites, and the low cant of enthuliafts.'

In a note on this passage, the Author remarks, with great candour and propriety, that 'in the thoughtless and polite reign of Charles II. it was not unusual for the clergy, in their fermons, to descend to vulgar jests and low burlesque. The licentious spirit of the times was greatly cherished by the wonderful success of Butler's poem [Hudibras], whose playful, sportive genius united the most satisfical keenness with pleasantry and good humour.' We are entirely of Mr. M.'s opinion with respect to this very celebrated poem. In exposing with infinite wite and humour the enthusiasm and hypocristy of the sectaries, it became, by accident, highly prejudicial to the interests of rational religion; for sew could properly distinguish the true objects of this inimitable satire, or learn from it to laugh at sanaticism, while they held genuine piety in the estimation it deserved:

Stulti in contraria currunt!

And often we see the allegory realised in common life, that the ejection of one unclean spirit only makes room for the entrance of

seven other spirits more wicked than the first.

The Author having, in the Differtation, spoken of those who, far from impious or unprincipled in their dispositions, yet being of a cast too refined and sceptical, are unsattled in their principles, and constant in their neglect of divine worship, observes, in a note referring to this passage, that it hath often and justly been lamented, that in comparing the merits of the candidates for the first degree (viz. in the University of Cambridge), too much stress is laid on the abstracer parts of algebra and mathematics. For although (says he) the high and uncommon superiority of our worthy

Worthy professor in that branch, reflects a lustre on the university, yet the utility of it, except in the bands of a master, is very problematical. That it possibly may be the means of further discoveries in natural philosophy, no one can deny; but unless the study of it had a tendency to strengthen and improve the understanding, which no one can affert, it is furely wrong to impose it on youth, as a necessary task, and suffer it to interfere with, and almost exclude those fludies which bave this effect in a high degree, and whose great importance, in every view, is univerfally acknowledged. Much praise, therefore, are those gentlemen entitled to, who have endeavoured of late to reform the system in this particular; to bring back our fludies to the plain old road of nature and common sense, which will not allow the fabrick to be finished before the foundation hath been laid-to establish merit on a broader as well as on a founder basispreserving to every kind and degree of it a just attention and esteem, by procuring a distribution of academical honours, better adapted to the wife ends for which they were instituted."

These remarks are liberal and just, and well introduced on the present occasion; though, at first fight, and in a detached view, they may seem to have no immediate connection with the object of this Differtation. Mathematical learning hath been supposed to be useful, as it habituates the mind to a closeness of thinking, and a certain patience of investigation. But this advantage, arifing from its study, is supposed, by many very penetrating writers, to be frequently overbalanced by the prejudices it occasions. It is too apt to contract the powers of the mind, and confine them to those limits which, though they may well enough fuit mathematical demonstrations, by no means agree with the more enlarged scope of moral truth. Accustomed to one method of enquiry, mathematicians are apt to be too fuspicious of any other that is not conducted by rules equally rigid and definite; and, diffatisfied with every degree of evidence below the absolute certainty of a mathematical theorem, fall into scepticism with respect to religion, and sometimes, with infufferable vanity, attribute that to a profound fagacity, which was the fole effect of a narrow and prejudiced mind.-We are convinced of the utility of mathematics in the hand of a master,' (as our Author appears also to be); but in a university, where students are chiefly designed for an active and focial, and not a merely speculative life, we apprehend those studies deserve the first encouragement which tend to enlarge the mind with liberal fentiments, and tincture the heart with those moral and religious truths, which have the happiest tendency to promote the interest of society, and the true ends of a rational existence.

In the notes affixed to this Differtation, the Author takes notice of some eminent preachers, and classes them according to their respective merits, under the different articles which he treats

treats of. Of Dr. Hurd, the present Bishop of Litchfield and Coventry, he says, 'No person ever understood the art of method to thoroughly, or has been to fuccessful in shewing the advantages of it, as this prelate. It would be difficult indeed to mention any other excellence of writing which his Lordship does not possess in a very eminent degree.'-Dr. Blair is particularly distinguished by our Author for a genuine pathos, as well as 'for every other grace and perfection of writing.' He is also lavish of his praise on the compositions and style of preaching of the late Archbishop Secker, and is displeased with Mr. Pope for bestowing on him nothing more than the negative and niggardly commendation of-Decency. The characteristics of this Prelate's sermons are, in the opinion of Mr. Mainwaring, 'much learning, argument, and good sense united in a degree beyond what they ever were before, with the familiar and popular manner of preaching.' 'An earnest and persuasive plainness in his delivery, which made every hearer in a crowded congregation still fancy himself was the person ad-

dressed, is also the leading characteristic of his style.'

Having spoken of the 'powerful union of taste and genius with learning and good fense,' he produces 'the sermons and charges of the late Dr. Powell, as an eminent instance of their happy alliance.' The mention of this truly respectable and honoured name, draws from our Author a warm tribute of grateful remembrance: 6 On every account (says he) the whole fociety over which he presided, might justly join with me in

faying,

Semper bonos, nomenque tuum, laudesque manebunt."

Semper bonos, nomenque tuum, laudesque manebunt."

Dr. Ogden is complimented for some fine strokes of the pathetic, and now and then of the fublime; but Mr. M.'s encomiums are few and feeble, when compared with the censures which he hath bestowed (and somewhat severely too) on the me-

thod and style of that ingenious preacher.

The ingenious Author having discussed the nature of compolitions for the pulpit, under the feveral heads before enumerated, concludes with some general remarks on the great importance of industry and application in the execution of any work designed for the public eye. He very justly observes, that without art and labour, although some may succeed much better than others, no man can produce any thing that deserves to live. Even Shakespeare himself, whose genius might almost be termed inspiration, was not exempted from the common lot; but employed on his best productions much more attention than the indolent and vain pretenders to genius are willing to believe.'

These remarks may, with great propriety, be applied to sermons, especially if composed with a view to publication; though we have known some vain preachers, priding themfelves for a most extraordinary quickness in composition, so little convinced of the necessity of labour or art, that the first stroke of the pen hath actually whisk'd them through a whole sermon before they have had the power to stop; and, what is still more extraordinary, we have heard of those who have sent sermons to the press, "verbatim et literatim," as they dropped from the pens of their respective authors in the "short interval between morning and evening service!"——as they themselves have informed us,—pretendedly to ask the reader's indulgence, but in reality to excite his admiration!

The Sermons now offered to the public by Mr. Mainwaring, are the very opposite to those hasty and sutile productions. They are the compositions of labour and art, as well as of judgment and genius. The former may indeed be thought by some readers to be too predominant; but we think no impartial critic will deny their having a very considerable claim to the latter. The Author informs us, that they were calculated for the university; and that consideration is sufficient to excuse the Author for the more than ordinary pains which he appears to have taken, to render them worthy the attention of men of judgment and learning.

We shall select a sew passages from his sourth sermon, preached on the 20th of May, as a specimen of his sentiments on certain nice points of politics and religion, which will also give our Readers some idea of the Author's style and manner of

composition.

Our civil constitution, from the natural opposition between the members of which it is composed, contains in it the seeds of continual discord; and our facred system, though excellent, like the other, on the whole, never pretended to be free from faults, or to have attained the utmost perfection of which even buman ordinances may possibly admit. Both will have faults sufficient, in the best of times, to exercise the controversial and reforming spirit-a spirit which, when inspired by charity, and directed by good sense, does the office of a prophet or an apostle! Though not fond of detecting abuses, or exposing the authors, no tenderness for establish. ed systems, no fear of disturbing settlements, can restrain it, when the rights of nature are plainly violated, and oppression is avowed. It will kindle the coldest disposition, and animate the dullest, with all the ardors of enthusiasm. This principle indeed hath been so difgraced by visionaries, that men of fense, when they feel its divine energy, are asraid to acknowledge it. Yet this alone gives success to many of their noblest undertakings, by seizing those happy conjunctures, and improving those critical moments, which, when once loft, are never to be retrieved. What a pity such a generous principle should often be excited for wrong purposes, and sometimes commit the greatest excesses, even while it executes the decrees of reason and justice!

APP. REV. Vol. lxiii.

Nn

The

The Author's reflections on the character of Charles II. are

elegant and sensible:

· It is indeed surprising, that, educated in the school of advertity, and endowed befides with a good understanding, he should have derived no benefit from his own experience, or the recent effects of his father's errors. But it is quite natural, that one whose only serious pursuit was pleasure, and whose licentiousness in pursuing it made Majesty contemptible, should thun the controut of faithful ministers, and select the most unfit to advise and govern him. While such men as Southampton and Clarendon were his kuspers, there were some lucid intervals in the madness of his policy; which [policy], had he lived a little longer, would have forced things back into its former channel, and have ended in the ruin of himself or his kingdoms. The very circumstance which seemed to threaten the greaten mischief, was the chief fecurity: [viz ] that habit of profusion, which left no room for other and more pernicious applications of the public treasure. The precipitate undisguised bigotry of his fen producte the REVOLUTION; an event by far the most important in the course of our history, yet compassed at once, not only without bloodshed, but without the least breath of discord; in a manner indeed, if not really miraculous, yet not to be imputed to any known causes, or paralleled in any other history, or explained from the intervention of any haman art or contrivance.

The Author's warm attachment to the Revolution hath led him to express himself in language that will be deemed too strong and unguarded. But every true friend of liberty will admire the principle which dictated the following reflections: 'The heroic prince, who had lately rescued, and now governed, the people by their own desire, had no share in their affections! He had indeed but one method of engaging them. But his wife and virtuous conduct was not sufficient! His meritorious services were requited by ill humours! his generous designs misconstrued and

obstructed!

The other fermons in this collection are more of a practical and theological nature, and are particularly calculated to give rational entertainment and instruction to the student and the divine.

\* James II. was Charles the Second's brother, not his fon, as he is here called by a mistake somewhat unaccountable in such an author as Mr. M.

A.R. T. VIII.
Letters from a Tutor to bis Pupils. 8vo. 3s. fewed. Robinfee.
1780.

HIS anonymous Tutor addresses his Pupils on a variety of interesting topics. His style, though sometimes defective in grammatical nicety, is easy and familiar, equally adapted to the subjects he has selected, and to the capacities of

+ The author said to be the zers?

shole whom he wishes to profit by his instructions. The manner, however, in which those subjects are treated, though they often merit a very ample discussion, is too frequently superficial; and his fentiments, though agreeably expressed, seldom contain any thing fingularly new or striking. Those Letters which we think the least exceptionable, are on subjects of tafte, literature, and morals; though even here we meet with epinions rather fanciful than ingenious, and with many paffages we do not altogether accede to: for instance, the follow-

ing:
What can be the reason, why the French people are so much less troubled with distempers, and are so much more lively in their spirits, than the English? A gentleman of learning, with whom I had the pleasure of converting at Paris, made this observation on the subject: "You English people give no rest to your faculties; you take three meals every day, and live in conftant fulness, with-out any relief: Thus nature is overcharged, crudities accumulated in the vessels of the body, and you fall early into apoplexies, pal-fies, infanity, or hopeless stupidity. Whereas, if we are guilty of any excess, our meagre days, which are two in a week, bring us into order again; and if these should be insufficient, the season of Lent comes in to our relief, which is pretty fure to answer the purpose."

It is much to be lamented, and we are suffering for it in mind and body, that in these latter days of the Resormation, we have been so dreadfully afraid of supersition, that we have at length discarded every wholesome and necessary regulation; and because we do not whip our skins like the monks of antiquity, we stuff them till they burk. The consumption of animal food in England is by far too great for the enjoyment of health, and the public good of the community. The price of provisions becomes much more unreasonable; our fishery is neglected; and no one benefit arises, but that of putting money into the pockets of physicians and lawyers, which they never fail to do, who, with constant fulness, are sick in their bodies, and quarrelsome in their tempers. The calendar of the church of England, which is moderate enough in its restrictions, would be of infinite service to us, if it were duly observed. I once met with a wife and good man, far advanced in years, and of an infirm conftitution, who assured me he neither used nor wanted any other physician. If we were to adopt his rule, nature would have that sea-Sonable relief which is necessary; our health and our spirits would be better; suicide, a growing and tremendous evil, would be less frequent; our fishery would have better encouragement, a matter of no small weight to a maritime people, whose navigation is their na-tural desence; provisions would be cheaper; the nation in general would be wifer; and perhaps we should also have a better claim to the bleffing of bleaven, if we shewed a more pious regard to the wholesome regulations of the Christian church; which are now so shockingly neglected, that our feasts and merry-meetings are on Wednesdays and Fridays (perhaps on Good-Friday itself), when our .forefathers of the Reformation, who kept up to what they professed, were praying and fasting."

Nn2

Such

Such a medley of folly and false argument since the days of monkish superstition, is scarcely to be met with. To imagine there is less intemperance in gratifying the appetite with fish than sless, is as absurd and ridiculous as to suppose, that fasting one day will make a man more temperate the next; but to presume that the Supreme Being can be delighted with voluntary mortification, by which no moral purpose is answered, is not

only absurd but impious.

In the Letters on the Use of History and on Parties, this Writer attempts to revive the exploded doctrines of the Filmerian school; doctrines which, if rightly considered, are a libel on every government now existing. His attempt, however, is not likely to be very successful; his mode of reasoning on these subjects being as weak as it is difingenuous. Perhaps the influence of prejudice to blind the understanding, was never more conspicuous than in the letter on Private Judgment. What we call private judgment,' says he, 'is the judgment of a private person against the sense of the public, and in opposition to established laws and regulations: in other words, it is the judgment of an individual against the judgment of the society to which he belongs. They say, every individual must have a liberty to exercise this judgment: and fo I say likewise: for nothing can be enacted by public authority, which private judgment cannot arraign and condemn, if it is so disposed. When public authority has determined that two and two make four; thoughts are free; and an individual may deny that, or any other position whatever, and no law on earth can hinder him from so doing; for no society can make a law that shall hinder a man from being a sool. For himself, and within his own mind, where every man holds an œcumenical council, he will judge of things as they appear to him; and no body alive can help it; and therefore we are obliged to allow that every individual has a liberty of private judgment; that is, he has an actual liberty of contradicting all mankind, and of judging in opposition to all the law and all the reason in the world.'

According to this wife and curious argument, Luther, and the rest of the reformers, were sools; nay, the first Christians (after the cessation of miracles at least) were sools too; and all mankind, thanks to this polite and charitable writer's discovery, ought to have been Jews or Pagans to this day! Among the many seeble and forgotten opponents of Dr. Blackburne, who have desended this indesensible ground, we doubt whether the seeblest of them ever advanced any thing more suitle, illiberal, or bigotted than the concluding letter of this volume.

### ART. IX.

A New Treatife on the Art of Grafting and Inoculation. Wherein the different Methods are copioully considered, the most successful pointed out, and every Thing relative to these ancient, healthful, and agreeable Amusements exhibited in so clear and comprehensive a Manner, as will enable those who are perfectly unacquainted with this Department of Gardening, to become Masters of it in a very short Time. To which are added, Directions for chusing the best Stocks for that Purpose; and many curious Experiments lately made by the Author. Calculated, in a peculiar Manner, for the Use and Advantage of the Gardener, as well as for those who would wish to make this rural and pleasing Exercise a Part of their Amusement. By an experienced Practitioner in that Branch of Gardening. 8vo. 1s. Fielding, &c. 1780.

HIS tract, as the Author, with much confidence, afferts in his Preface, ' is the refult of reiterated trials, accumulated experience, and a long and unwearied application to this kind of amusement, which has engaged the attention of the Author for many years past, and enabled him to produce fomething new on the subject, worthy the acceptance of the

public.

With respect to the original matter, which, from the above passage, we were taught to look for, we must acknowledge ourselves in a great measure disappointed. The Writer, however, seems no way ignorant of his subject; and to novices in the arts which he professes to treat, his book will furnish every information that is necessary. That part of his work which ought to have been experimental, is merely conjectural. But as some of his conjectures are ingenious, we shall make no

apology for laying them before the Reader.

"Tis probable, that, if the bud of a quince were skilfully inoculated into some early apple flock, the same might be hastened as to maturity: also later grapes of a more delicate taste, artificially inoculated into more early, might do the same. And 'tis not unlikely, if accurate trials were made of this nature, but melons inferted into pompions, might make them both more early and more large, especially if the feeds of pompions were to be brought up in bet beds, to be ready early in the spring, while the others are also softered in the same, till they were fit for inserting. Again, 'tis probable, if the prolific buds of oranges (trained up from their seedlings in hot beds, or other fuitable foil) were inferted in some fort of trees that grow well with us, and seem somewhat to resemble them; as, for instance, in some choice apples (as pippins or pearmains), or in quinces, we might have oranges grow frequently with us in England; for the reason why such tender trees do not fructify with us, is the want of a competent beat, or the effect of our intense cold or frost in the winter-season, which reaching the roots of such weak trees, stints them, and prevents their fruit bearing, by suspending the sermental action Nn3 of of the seminal principles, nay, sometimes it so overpowers them, that

it totally kills them.

If, therefore, instead of training up orange-trees from hot nurferies, we take their prolific buds (which we can by hot beds easily procure), and infert them by inoculation into the stocks of the before mentioned trees, we shall absolutely fecure them from fress, which being removed by the aforesaid artiscial expedient, bids fair, on such trial, to have plenty of oranges grow with us in Bagland.

Thus also, if the fruitful buds of figs (which rarely in England come to maturity for want of sufficient heat) were inoculated into some kinds of good pear, such as the bergamets, &c. it might probably procure their maturity. These, I think, and many other observations and experiments concerning the maturation and melioration of

plants and fruits, might be made, not yet taken notice of.

What improvements might also be made are only here proposed to further trial, in order to the having of reses, and perhaps some other flowers, all the year, by inoculating their buds seasonably into some evergreens, such as yew, fir, or pine, especially if those trees were affished by some artificial beat, by being planted near some flowers or furnaces, where a proper heat might be kept and conveyed to them all the winter: for the principles in any prolific bud being set into motion, by being planted into any proper stock, the juice of that slock at the same time being warmed by any adventitious heat, or what way soover kept in action, becomes like a soil adapted for them, whereby the aforesaid principles become fermustal, vegetate, and put on the entire form of the whole plant or tree.

Though we are convinced, that the arts of budding and engrafting might be extended to many plants upon which they have never hitherto been tried; yet we should much doubt, whether plants varying so essentially in their organization as the rose and the yew, &c. could ever be made to harmonize together by any botanical skill whatever. That an union between the orange and the apple might be effected, seems not altogether improbable; and indeed, if we may credit the relation of some late missionaries in China, it is a practice not

unknown to that ingenious people.

With respect to the Author's idea of inoculating melons on pompions, there seems nothing to oppose its being carried into execution, but the difficulty of the manual operation, arising from the tenderness of the rind, and the succulency of the plants; and yet, after all, there appears little to be obtained by the experiment: for though it might make the fruit, which the writer proposes to improve by this method, earlier and larger, it would, in all probability, debase its slavour. The experiment, however, is easily made, and is at least worth trying.

TQ THE

MONTHLY CATALOGUE for December, 1780.

POLITICAL.

Art. 1. An English Freeholder's Address to his Countrymen. 4to. 1s. Robinson. 1780.

UR sensible Addresser, presuming, but not immodestly, on a forty years intimate acquaintance with all the revolted Golonies, offers his opinion of our American war; of which he predicts an event extremely unfavourable to Great Britain .- To prevent, however, if possible, the most fatal consequences to ourselves, from the measures which we have adopted with respect to this unhappy contest, he earnestly tenders his advice; -which is, in brief, that we ' make peace with America, before our successes are balanced by misfortunes, and before general vengeance supersedes the friendship yet sublisting between nations of the same origin, language, religion, habits, and complexion. - This, he acknowledges, will, to the high-spirited Briton, seem a bitter remedy for the dangerous disease under which our body-politic labours; but he concludes, that it mas be taken, or the nation will be undone.

For our Author's remarks on the county affociations; and the good use that might be made of them, if rendered complete, particularly by obtaining, through their means, a competent knowledge of the general sense of the people, with regard to their present fitua-

tion,—we must refer to the Address at large.

POETICAL.

Art. 2. The Patriotic Mice; or Modern H\*\*\*e of C\*\*\*\*\*: A Poem. By Mr. J. Y. 4to. 1s. 6d. Wade. 1780. A dull satire on the patriotic Orators in the British Parliament. MISCELLANEOUS.

Art. 3. The New Art of Speaking; or a complete modern System of Rhetoric, Elocution, and Oratory. &c. &c. &c. The Whole being particularly calculated to improve or refresh the Memories of the Right Hon. and Hon. Members of both Houses of Parliament, &c. &c. &c. and all such of both Sexes as attend the public Disputations at the School of Eloquence [Carlifle House], the Forum, the Female Parliament, Robin Hood, &c. &c. &c. 8vo. 28. Hogg. 1780.

We know not whether it was from impudence or ignorance that this paltry Catchpenny of some backnied Garretteer was inscribed to such respectable characters as Messes. Fox and Burke; - Gentlemen whose abilities and situation in life have placed them at an immense distance from those despicable Quacks in oratory, who, by the late mock-institutions at Carlifle-House, the Westminster-Forum, and other such places of idle resort, have almost brought Eloquence into contempt. - For the pseudo-rhetoricians, who frequent such Schools, this ' New Art of Speaking' may, indeed, he a very necessary com-

\*Written Gy D. Fothergill: See ? Lettrom's Sdit. of y? D. Works !

panion; and the Presidents and Tutors may here find sufficient materials to complete a modern Orator, whether male or semale! B. . R. Art. 4. A Differtation upon English Typographical Founders and Founderies. By Edward Mores, A. M. and A. S. S. 8vo. 6s. Nichols.

The Author fets out with observing, that 'the history of English Printers has been copiously handled [we wish that our learned countrymen would not longer bandle the English language in this clumsy manner] by those who, with commendable zeal and diligence, have delivered to us the Typographical Antiquities of the nation; but little or no notice has been hitherto taken of the Founder, although he is the first and principal mover in this curious art.'

The Letter-Founder is the caster, or maker of the types on which books are printed. Some of these artists have deservedly risen to great eminence, on account of the neatness and beauty of the characters which they have formed. Among these, several of our countrymen will, we suppose, ever stand in the foremost rank; particularly the celebrated Casson, who may justly be styled the English Election.

Caxton stands first in the order of time; he began to be distinguished as an artist in this branch, in the year 1474. Since that zera, we have had our James, our Casson, and our Baskerville; with others, brought up under Casson, who restect no dishonour on their ingenious master.—The account here given of these Artists, which includes the history of the art itself, is not unentertaining; though intermingled with certain peculiarities of the Writer, whose manner has more of the mere Antiquarian than the man of Tasse.

Art. 5. Free Thoughts on Rhetoric. Being the Production of a Gentleman of distinguished Abilities, lately deceased. Wherein is fully pointed out, the different Species of Eloquence, and their Effects, and the Causes of their Effects examined and considered; and concludes with some general Observations upon the Whole. Also, a short Critique upon the Eloquence of Demosthenes and Cicero; together with some Observations upon the Orators of the present Times. 8vo. 1s. Fielding and Walker.

If this performance be really written by a Gentleman of distin-

If this performance be really written by a Gentleman of distinguished abilities, it can add very little to his reputation. Though he appears to have been possessed of some knowledge of his subject, yet his observations are, in general, slimsy and supersicial; and the language in which they are conveyed is stiff and inelegant. The inaccuracy (to use no harsher expression) that is pointed out by Italics in the Title-page, is not the only one that might have been taken notice of.

Art. 6. Lives of the British Admirals: containing a new and accurate Naval History, from the earliest Periods. By Dr. John Campbell. With a Continuation down to the Year 1779, including the Naval Transactions of the late and present War; and an Account of the recent Discoveries in the Southern Hemisphere. Written under the Inspection of Dr. Berkenhout. The Whole illustrated with correct Maps; and Frontispieces engraved from original Designs, 8vo. 4 vols. 11.4 s. Boards. Donaldson.

original Designs. 8vo. 4 vols. 1 l. 4 s. Boards. Donaldson.
The Lives of the British Admirals, compiled by the late ingenious
Dr., Campbell, is a book well known. It passed through several
editions

nue

editions during the Author's life; and it is now continued to the present time with a suitable degree of attention and spirit. The additions are very considerable; amounting, if we mistake not, to one-fourth part of the present edition.

Art. 7. The Beauties of British Antiquity; selected from the Writings of esteemed Antiquaries. With Notes and Observations. By John Collinson. 8vo. 6s. Boards. Longman. 1779.

This Author enters on his subject by observing, that the antiquities of Great Britain are, beyond dispute, far more numerous andmore curious, than those of any other nation in the habitable world. not even excepting Italy itself, whose ruins are so much glorified by the legendary traveller.' Certain it is, that the Isle of Britain furnishes numerous and curious antiquities; that they are far mere numerous and curious than those of any other country, we must confider, at least, as doubtful. Mr. Collinson has compiled his volume from the works of Leland, Camden, Stukely, Grofe, Willis, Dugdale, &c. and chiefly, he tells us, in the words of each author; though fuch additions are made as were judged necessary; and some parts will be found original.' British antiquities here enumerated are, Stonehenge, the Barrowe, Abury, Silbury Hill, and Rowlright. Roman remains are, Bath, Kenchester, Camalet Castle, Silchester, Verulam, London, Lincoln, Limme, Burgh Castle, Dover Castle, Old Sarum, Cirencester, Caerleon; the four great Roman Roads, Next follow Saxon antiquities, chiefly confifting Picts Wall. of, St. Peter's church, Oxford; Iffley church, near Oxford; the church in Dover Castle; St. John's church, near Lewes; the White Horse on Ashdown Hill, Berkshire. Antiquities subsequent to the Norman Conquest close the volume; such as, Kenilworth Castle, Caerphily Caille, Glamorganshire; Carregkennin Castle, Carmarthenshire; Rochetter Cattle, Portchester Castle, Aberconway Castle, Carnarvonshire; Godrick Castle, Herefordshire; Farley Castle, Somersetshire; Glastonbury Abbey; Westminster Abbey; Goditow Nunnery, Oxfordshire; Kirkstall Abbey, Yorkshire; the Hospital of St. Cross, Hampshire; St. Botolph's Priory, Colchester; Malmsbury Abbey, Wiltshire; Durham Cathedral; Chester Abbey and Cathedral; Warkworth Hermitage, Northumberland; which is the last article in the volume, and not the least amusing.

We have only to add, that this book, agreeably to the design of the Compiler, furnishes the Public with a compendious account of the most remarkable antiquities in England and Vales.

Art. 8. Observations on the Military Establishment and Discipline of his Majesty the King of Prussia; with an Account of the private Life of that celebrated Monarch; and occasional Anecdotes of the principal Persons of his Court; interspersed with Descriptions of Berlin, Potsdam, Sans Souci, Charlottenbourg, &c. Transitated from the French, by J. Johnson, M. A. Svo. 25. Fielding and Walker.

An ample account of this entertaining work, on its original publication, was given in our Review, vol. lvii. p. 510.; and the feveral detached extracts that have appeared in our periodical collections, fince this translation has been made, render it too generally known to enlarge farther concerning it. There is a good frontispiece added, exhibiting

exhibiting the King of Prafia on horseback, reviewing his troops.

RELIGIOUS.

Art. 9. An Explanation of the Prophecy of the seven Vials, or the seven last Plagues, contained in the Revelation of St. John, Chapters XV. XVI. By a Country Clergyman, 8vo. 1s. Rivington. 1780.

It is at least highly expedient that Authors should read before they write; and know what others have published, before they resolve so publish themselves. 'I have not,' says this Writer, 'Bishop Newton's Dissertations on the Scripture Prophecies by me, but from the compilations of the Commentaries I have, -I find they,' that is, Bishop Newton and others, 'look upon all the plagues contained in this chapter, as not being yet accomplished, and so have not attempted any particular explication of them.' We know not what Compilations of Commensaries this Country Clergyman may have in his library. His collection must undoubtedly be very impersect. At leaft, we may be certain, that Lawman's Paraphrase, and Notes, on the Revelation of St. John, does not make a part of it. According so that learned Commentator, the events prefigured by five of the seven vials, have already taken place. Nor is he fingular in this opinion. Indeed, if the Author of this pamphlet had condescended to have looked into Mr. Lowman's Paraphrase, he would have sound the greater part of his defign anticipated, and might have contracted his work into a compass too small for a separate publication. The only part which can properly be called new, is his explanation of the fourth vial. By the Sun, upon which the vial was poured, our Author understands 'the Gospel; or, in a more extensive sense, the whole Scripture: and so applies the prophecy, to the translation of the scriptures into the vulgar tongues, and their introduction among the common people at the Reformation, which gave great uneafiness and torment to the Church of Rome, &c.' Mr. Lowman, in agreement with other expositors, and with greater probability, understands by the Sun, the Papal dominion and authority; and applies the prophecy to the mischievous and destructive effects of the ambition and contentions of the Popes, from about the year 1371, to the beginning of the fixteenth century. From some late publication, our Author has adopted an opinion, that the fifth vial prefigured the dissolution of the order of the Jesuits. According to Mr. Lowman, this part of the prophecy was accomplished at the Reformation.

We are forry to speak thus slightingly of a publication, which is written with great seriousness and moderation, and discovers an amiable spirit of candor and liberality in the Author. But something more than good intentions and dispositions, is necessary in one who professes to instruct the Public, and especially who undertakes to explain the Revelation of St. John.

Art. 10. The Heavenly Dollrine of the New Jerusalem: Translated from the Latin of the Honourable Emanuel owedenborg, of the Senatorial Order of the Nobles, in the Kingdom of Sweden. 8vo. 2s. fewed. Philips. 1780.

The Translator informs us, that this work is called the Doctrine of the New Jerusalem; ' because, by the New Jerusalem is fignified.

the New Church on earth which is now about to be established by the Lord; and is particularly described in the 21st chapter of the Revelation. The Old Christian Church, it is faid, which was formerly founded by the Lord, is now at its period, or confummation, in confequence of its fuccessive corruptions in life and doctrine; for where genuine charity and genuine faith are extinguished, there the Church is at an end; inalmuch as charity and faith, operating in the heart and actions of men, alone constitute the life and existence of the Church. It hath therefore pleased the Lord of his mercy, to the end that his kingdom may still remain on earth, and that he may thence be Supplied with members for his glorious kingdom in heaven, to begin at this time the establishment of the New Church which he had foretold, and to reveal the doctrine of that Church in our Author's writings. This doctrine is called, Heavenly, because it is founded on the spiritual sense of the word of God; and was revealed to our Author, as he expressly declareth, immediately from the Lord, ogt of heaven, while he was reading the Word.

Possibly, when the doctrine here taught is stripped of its peculiar garb, it will be found to mean nothing more than that real piety, integrity, and goodness of heart, which all good men must plead for, and earnestly wish to see universally prevail. The Translator and Editor of this Tract has, we suppose, different views of the subject, and sirmly believes in its Author as an inspired Prophet, raised ap to reform the Church. As we shall not dispute with him on this head, we will only add, that while we cannot but consider the late Count Swedenborg as an enthusiast of the first order, we must also regard him as a most extraordinary, and, indeed, a most wonder-rull man!

Art. 11. In Essay explaining Jesus's true Meaning in his Parables, from the Occasion of his speaking, and the Application of them. By William Ashdowne. 8vo. 1s. 6d. Canterbury, printed.

Flondon, fold by Macgowan. 1780
We have had many wild and arbitrary interpretations of our Saviour's parables, and of other parts of scripture, through & failure of attending to their immediate connection and defign. Thus far we agree with this Writer: But we must acknowledge ourselves disappointed when we came to look over the pamphlet, which bears The style is negligent, defew marks of ingenuity or learning. fective, and unpleasant; and the observations are often trite and uninteresting. Our Author mentions, more than once or twice, the parable of the prodigal, as having shared with others in missinterpretation; and he writes concerning it, and two preceding parables in St. Luke's gospel, in this manner:- 'The conclusion and application which Jesus leaves with his accusers and the people was, that if the steps these several persons had taken in seeking and finding what they had lost, and the reciprocal joy it excited in them, and those who were their friends, was perfectly natural and therefore justifiable; and likewise the conduct of the father towards the rezurned penitent fon, they could not but acquit him of having acted reproachable to his prophetic character, in receiving and eating with publicans and finners, as in doing that he was feeking and hading, and also saving the left sheep of the House of Israel. At the same time he leaves his representation of the angry and murmuring for against his father, as a just draught of the principle and conduct of his unjust accusers, to their own reflections upon it, as well as that

of the people's.'

Mr. Ashdowne seems pleased with his discovery, 'that our Lord, in these parables, intends solely to vindicate his conduct in associating with publicans and finners;' and observes, in some kind of triumph, we may with certainty infer, that the usual explanation given by Smost expositors,—that by the undutiful son, Jesus designed to reprefent the Gentiles; by the father, bis Father; and the reception the fon met with, that of a finner's acceptance with God; the angry murmuring brother, the Jews murmuring against the Gentiles being received into the kingdom of God-are all equally alike wholly foreign to the intention of the speaker, and therefore void of truth, as not in the least comprehended in the true occasion of his speaking the parable.'

But though we agree with this Writer, that fanciful commentators and preachers have too often obscured what they pretended to elucidate, and wandered wide from the truth of scripture; though we also allow him to be right as to the immediate occasion of these parables, we must yet confess that we do not perceive any thing unjustifiable or improper in supposing them to have a farther view, and generally to fignify that compassion and favour which a finner will meet with from the Great Father of mercies, when he repents and returns to his duty. Our Lord himself teaches us this, when he speaks, at the very time, of joy in heaven over a sinner who

repents.

On the whole, though Mr. Ashdowne's remarks on the misinterpretation of scripture are often very just and worthy of attention, yet it does not appear that his performance will yield the reader all that fatisfaction and improvement which might be expected from the nature and defign of his undertaking.

### E R M O N S.

I. Preached at the Assizes at East Grinstead, Sussex, March 20th, 1780, by William Gwynne, B. A. Master of the Grammar 4to. 1 s. Cadell. School at Lewes.

From Rom. iii. 18. There is no fear of God before their eyes.—Mr. Gwynne delivers a very seasonable and useful discourse. He confiders a principle of piety as the spring of an upright and virtuous conduct; and which, so far as it really prevails, creates a just confidence between man and man. It is therefore peculiarly suitable to the occasion of his discourse, to recommend the careful cultivation of this principle, at all times, as he very properly does, to judges, justices of peace, juries, witnesses, &c. &c.

II. Preached at the Assizes at Horsham, in Sussex, August 11th, 1780: By William Gwynne, B. A. Master of the Grammar

School at Lewes. 4to. 1 s. Cadell.

This, like the former, by the same Author, is a good and useful discourse. It is ushered in by a dedication to Lord Mansheld, in which Mr. Gwynne feems rather to run into that adulation and flattery which he professes his desire to avoid. The subject of the Ser-

mon is implied in the words of our Lord, Have peace one with another. From which he directs and recommends, with sense and judgment, the cultivation and exercise of a peaceable temper and practice, in the different views in which it may be considered.

## CORRESPONDENCE.

To the Authors of the Monthly Review.

GENTLEMEN,

N the Preface to the late edition of Mr. Jeremy White's Treatife on "The Restitution of all Things" (of which some account was given in your Review for September) the names of several writers on the same subject are taken notice of. The Author might have increased the catalogue. I beg leave to mention one writer of distinguished celebrity in his day, though his name is now almost forgotten; who, though he did not appear as a professed vindicator of Origenism, yet, in a very long and elaborate treatise, he advanced such positions as evidently lead to it. This writer was PETER STERRYa Puritan divine, of great account with Oliver Cromwell; and if the author of Hudibras is to be believed, he attended the Protector in his last moments, and uttered some extravagancies that were hardly confistent with a found state of mind. But whether these were the exaggerations of a malignant wit, who eagerly caught at the tale of the day, in order to expose a hated party, or whether there was in truth any ground for the report so much to the discredit of his understanding, is a point I am unable to fettle. Be this as it may, Mr. Sterry possessed a very considerable share of metaphysical acuteness; and though the luxuriancy of his imagination led him to adopt some fingular notions in religion, and to express himself in a visionary style, yet his treatise entitled " A Discourse on the Freedom of the Will," contains a variety of curious and original restections on the several subjects debated between the Calvinits and the Arminians; and breathes a spirit of candour and benevolence almost unknown to the disputants of that day.

The Preface to this fingular treatise is a most beautiful picture of an enlarged and liberal mind. It is too diffuse and metaphorical; but it abounds with passages uncommonly elegant, and a kind of Platonic sublimity blended with the purity and benevolence of Christianity, strongly characteristic of an ardent and vigorous sancy, and

der the influence of evangelical truth.

The Author was a strong Necessarian, and, consistently with his principles, he adopted the scheme of universal charity. Dr. Priestley somewhere says, that a Necessarian is under the strongest obligations, by his own system, to exercise candour to all men. Mr. Sterry thought the same, and expresses his sentiments on this head with equal energy and impartiality.

I will beg leave to communicate to the numerous Readers of your excellent Journal, one or two striking passages from this curious Pre-

face, leaving it to them to make their own reflections on it.

A posthumous work, published in the year 1675, fol.

St. Paul says, Sin decrived and then flew me. No person is willingly deceived in his apprehensions of touth, or disappointed in his expectations of good. But sin, by its deep and mysterious enchantments, changes itself into the most alluring resemblance of the heavenly image. . . . . Yet fill in the midst of these enchantments-yea under the power of darkness and death itself, as the Athenians had att altar inscribed, "To the Unknown God," surrounded with altars profituted to the service of false divinities, so the understanding and will, according to the proper qualities of their nature, exist in EVERY spirit, as altars in a temple, burning with their own sacred fire, and aspiring to the highest heaven, through all the clouds of darkness that obscure and oppress them.'

Charity beareth all things-or, as it may be rendered, compre-Bendeth all things. It throws a lustre, a pleasing comelines, on every object, and comprehends every being in its good withes. Nothing is abandoned by it; for "it believeth all things and hopeth all things." Like its divine principle in the Godhead, it hath an unrettrained complacency in all his works, and pronounceth them OOOD. It believeth all things to be the tabernacles of the Divinity, like that in the wilderness, which, though moving through the barren desert - a land of graves - of fiery serpents, and beasts of prey, yet answer to their ORIGINAL pattern on the Mount: and though covered with a coarse tent, that hath felt the sury of the elements, yet within are filled with the presence of Jehovah himself-the glory of Him who is all in all.'

Let not any man rashly question the close contexture of the whole work of God, through all the feveral parts and conduct of it, by an invariable union of causes and effects, because he meeteth with a HELL as well as a heaven, as one of the extremes of this work. Divine love (which transcends all human wisdom) knows how to joint even hell into its work, with fuch surprising skill, that even this shall be beautiful in its place, and add a grandeur, a symmetry, yea, a loveliness to the whole.'

I must acknowledge, that the luxuriance of Mr. Sterry's language is in some degree repressed in the above extracts; but his idea is most scrupulously preserved, and no liberty taken but such as was necessary to give his sentiments their proper energy.

> I am, Gentlemen, Your constant Reader.

# B...k.

L. K.

• The Letter figned A Polygamist, is in every view improper for infertion in our Journal, especially as the Writer of it hath proposed a continuation of his remarks. We cannot make the Monthly Review the vehicle of litigation. Our work would be endless, if we held ourfelves bound to answer every captions querift who might think proper to call us to an account for delivering an opinion that fuited not his

We are, nevertheless, always disposed to avail ourselves of the hints, corrections, and animadversions of our learned and intelligent Readers; and shall, with equal deference and gratitude, kift the red of the more fober critic. We wish we could compliment our present Correspondent Correspondent with this appellation; but that "impartiality" for which he compliments us, forbids it. His observations have no claim to criticism; they are vague, triffing, and impertinent: and notwithstanding the Author talks with abundant vanity of his 'various and extensive reading,' yet we must freely tell him, that his reading doth not appear to have had the happiest influence either on his underilanding or his manners.

Our Correspondent, besore he thought proper to act the critic on our remarks on Mr. Madan's Thelyphthora, should have taken care to have understood them. That he doth not, will appear from the following passage of his Letter. Addressing himself to the Reviewer of Madan's treatise, he says—' Polygamy, you allow, might suit a state of innocence, which, in my opinion, is saying much in its savour.' Now, unfortunately for this Critic, the Reviewer hath faid no such thing: - so far from it indeed, that he considers the primitive institution of marriage, which limited it to one man and one woman, as a proper model for connubial contracts, especially under the refined dispensation of the gospel, which expressly instructed its professors to regulate their conduct in this respect by that practice which had its sanction from the age of original innocence. The Reviewer thinks, that the practice for which Mr. Madan is so zealous an advocate, had its origin in that licentiousness of principle, and depravation of manners, which succeeded the Pall, and may jullly be numbered among those many inventions which man fought out, when he ceased to be upright.

If our Correspondent will be at the pains to revise the passage [p. 232. Rev. for Octob.], which he hath so hastily caught at as a concession in favour of Polygamy, he will be convinced that he hath totally misapprehended the whole scope and tenor of the argument; for the Reviewer is not speaking of Mr. Madan's doctrine of Polygamy, but of his loofe, unguarded, and dangerous polition, respect-

ing the forms and ceremonies of marriage.

Our Correspondent talks of his anatomical preparations: from hence, and from some other passages of his Letter, we presume he is a person of some medical profession: but if we were to transcribe that part of his Letter, in which he speaks of those "infallible marks of pure and genuine modern virginity, which he hath often met with in the course of his practice," his brethren would consider him, either as

wantonly humorous or gravely ridiculous.

Our Correspondent's reflections on the case of Dinah are nugatory and superficial. " It was, says he, an absolute rape, or to say the least, a mere casual rencounter in the fields." This saving clause will by no means avail our Critic; on the contrary, it annihilates the whole force of his argument. If it was only a casual rencounter in the nelds,' Dinah was to all intents and purposes, on Mr. Madan's scheme, the wife of Sechem. The very act itself, whether casual or concerted, made her so; and no powers under heaven could diffolve the union. Vid. Exod. xxii. 16, 17 Deut. xxii. 28, 29. and above all Mr. Madan's reasonings on these texts, in Thelyph. vol. I. 24-29. Our Correspondent's affertion, that it was an absolute rape, is a mere gratis didum. The Hebrew word by no means denotes force

force or constraint; and is very properly rendered by our translators—He TOOK ber [TULIT eam. Montanus]. But the reply made by her brethren to the expostulation of Jacob, is a demonstration that no violence was used—" Should he deal with our fister as with an barlot?" Our Correspondent thinks that Mr. Madan acted very judiciously in passing over this case of Dinah, without making any particular observations on it. We think he acted disingenuously; for in our view it is a case so much in point, that it could not be pass'd by without design.

If this Letter-writer had defigned to have written a regular reply so the remarks in the Review, he should have taken some notice of our animadversions on Mr. Madan's unwarrantable liberties with several texts of scripure, before he proceeded to take the case of Dinah into consideration. He hath past over the criticisms on Gen. ii. 24. Mat. xix. 5. and omitted to take any notice of our remarks on Mr. Madan's absurd interpretation and perversion of Exod. xxii. 16, 17. In this, we think, he hath acted full as judiciously as Mr. Madan, in

his omitting to take notice of the case of Dinah.

We can give no encouragement to this Correspondent to continue his animadversions in the line he bath chosen. If he deems them of too great consequence to be lost to the world, we would advise him to collect them together, and publish them in a pamphlet. They will then fall under our observation in the common course of reviewing; and we will not fail to pay them all that respect to which their merit shall entitle them.

† † † Our best acknowledgments are due to our Correspondent L Z, for the hearty laugh he has afforded us, by the description of the weekly club, whom, in our defence, we had occasion to mention lately, under the title of the Mathematical Society [M. R. Septemb. 1780, pag. 238.], as having given their sanction to a new philosophical system, on which we had found ourselves obliged to pass some ftrictures. The particular Reviewer, however, whom he so earnestly invites to accompany him, incognite, to visit this body on a Saturday night, would right gladly listen, in a corner, to the 'learned lecturer's' orations against Newton, and in favour of the air yeleped wital, did he not dread detection, and its possible consequences to his person. He must therefore decline L Z's friendly offer, and be content to enjoy, in idea only, the rich humour of the scene he paints; part of which he would here transcribe, were not the proceedings of the principal actors in it-[he means no disrespect to the harmless audience, who meet to drink their porter in quiet]-though excellent subjects for a news-paper essay, rather of too ridiculous a cast to be admitted into a grave and fober literary journal.

Sir Robert Cotton's "Discourse on the Authority of the high Court of Parliament," concerning which a Correspondent inquires, was published three times in the last century; but the impressions, besides being now not easily to be met with, are full of saults. Perhaps a new edition, from a more correct manuscript, with notes, might be acceptable to the Public.

To the REMARKABLE PASSAGES in this Volume.

To find any particular Book, or Pamphlet, for the N. B. Table of Contents, prefixed to the Volume.

A IR, inflammable, experiments and observations on, 374. Account of a new kind of inflammable air or gass, 375.

ACHARD, M. his new invented Thermometer, 501.

Acta Osnabrugensa, &c. 141. ADULTERY, ought to be made a The nacapital offence, 275. ture of this crime defined, 276. AGOSTINI, his collection of an-

cient gems, 294.
